Minor parties have existed throughout American history. Independent or minor party candidates occasionally even attract a significant percentage of the popular vote in presidential elections or win congressional office. Nonetheless, American politics is based on conflict between two major parties. This two-party system has existed in various forms throughout the history of the American republic. Today's Republican and Democratic parties are merely its latest incarnation. This two-party form of partisan electoral conflict is unusual (though not unique; Costa Rica and some other countries also had or have because Costa Rica's two-party system has declined recently) when compared to the politics of many other democratic countries across the world. Why is American politics based on conflict between two parties?

Winner-take-all elections are the chief reason. **Duverger's Law** states that first-past-the-post or winner-take-all electoral systems cause political conflict to be centered around two-party competition. While exceptions exist (e.g., India, see Diwakar 2007), Duverger's Law is generally true

across the world. American congressional and state legislative elections feature single-member districts and states, instead of multimember districts in which parties receive a number of seats in the legislature proportional to their percentage of the popular vote. These kind of legislative elections give each party a very strong incentive to appeal to voters who might consider a minor party, such as the Constitution Party or Green Party, and co-opt them, because a small percentage of the popular vote can be the difference between winning a seat and getting nothing.

American presidential elections are more complex because of the Electoral College. Even so, almost all states effectively give all their electoral votes to the candidate that wins the statewide popular vote. This means the incentives of Duverger's Law also apply to presidential elections. America is a two-party system because of its winner-take-all elections, and will presumably remain so, perhaps with brief interruptions, for the foreseeable future.

## The Meaning of Partisanship in the American Public

Classic scholarship from the 1950s and 1960s (see Campbell et al. 1960) on the meaning of partisanship in the American public found that party identification was primarily about an American's social groups and place in American society. For example, union members were more likely to be Democrats, while business people were more likely to be Republicans. Family allegiances to each party were also very influential. Most Americans did not know much about politics and saw the national Republican Party and national Democratic Party as relatively similar in goals and issue positions. American voters were not particularly ideological or issue oriented and did not see the two parties in those terms either.

This kind of mass partisanship was presumably in part a response to the unusual circumstances of party conflict during the early Cold War. During the 1950s and early 1960s, Republican members of Congress were slightly more conservative than Democratic ones, but not by much (Cox and Poole 2002). There was considerable ideological overlap between the two parties. Both the Democratic Party's politicians and the Republican Party's politicians, on average, accepted the New Deal welfare state, the favorability of the nuclear family and traditional social stratification and norms, and the necessity to fight communism and the Soviet Union at home and abroad. While there was considerable regional variation, with Northeastern Republicans more liberal and Southern Democrats more conservative, there were many conservatives, moderates, and liberals in each party's congressional delegation.

In response to a variety of political and cultural phenomena in the mid and late 1960s, elites in both parties began to take increasingly different positions on economic, social, and foreign policy issues. The upheavals of the sexual revolution, civil rights movement, Vietnam conflict, President Lyndon Johnson's Great Society programs, popular drug use, and (a few years later) Watergate caused the Republican Party to start moving to the right (favoring a smaller government overall and especially in the economy, traditional Judeo-Christian morality on social issues, and a hawkish, assertive American foreign policy) and the Democratic Party to start moving to the left (favoring a larger government role in the economy, acceptance or promotion of nontraditional morality on social issues, and a dovish, multilateral American foreign policy focused on diplomacy). Over the course of the next two decades, Democratic Party elites became predominantly liberal and Republican Party elites became predominantly conservative. By the early 1990s, congressional scholars (Cox and McCubbins 1993; Aldrich and Rohde 1997) were analyzing two parties who advocated for markedly different policies and behaved in a very partisan fashion.

Politically active Americans outside of government received the message that the Republican Party was for conservatives and the Democratic Party was for liberals, and responded accordingly. By the mid-to-late 1990s, there were significant issue differences among Democratic and Republican partisans in the mass public (Abramowitz and Saunders 1998). This phenomenon was caused by two important processes. Moderate

mass Democrats and Republicans slowly converted their issue positions to the more liberal and conservative ones of their national party. Liberal Republicans and conservative Democrats realized they were no longer welcome in their parties and switched their partisan identifications. Older, more moderate Republicans and Democrats passed away, and they were generationally replaced by younger partisans attracted to the conservative and liberal messages they received from their respective party elites.

Today, the Democratic Party in government is almost entirely comprised of liberals. It is mirrored by Democratic partisans in the public who also favor a more expansive welfare state, promotion and acceptance of nontraditional morality and lifestyles, and a more dovish, multilateral approach to foreign policy abroad that relies primarily on diplomacy to solve problems. The modern Republican Party in government is overwhelmingly conservative. Contemporary mass Republican partisans also favor lower taxes, a smaller and cheaper government with fewer programs, promotion and acceptance of Judeo-Christian morality and lifestyles, and a foreign policy that emphasizes American power and interests and relies on the threat of the use of force to solve problems. There are virtually no moderates among Democratic and Republican Party elites, and far fewer among mass Democrats and Republicans than there used to be.

Partisanship in the modern American public is based on ideology and issue positions. The public, especially the political active public, is far more aware of politics than it used to be and generally understands the basic differences between the two parties. This means that partisanship in the American public today is much more meaningful and significant than it was in the middle of the twentieth century.

Specifically, American mass partisanship now fits well with the **rational choice theory of partisanship**. The rational choice approach to social science emphasizes the importance of individuals being able to rank their preferences over outcomes and act to achieve their maximum value from them. The rational choice theory of partisanship argues that individuals identify with the party that is closest to their ideology and issue positions. If they are even a little left of center, individuals identify with the Democratic Party; those even slightly right-wing identify with the Republican Party. While this theory does not perfectly capture the dynamics of American partisanship (there are far more independents, and ideological ones, than the theory would expect), it correctly describes the primary meaning of American partisanship today. Party identification in America is now usually synonymous with conservatism and liberalism.

While partisanship is now an ideology, this does not mean there are no other aspects to it. The rise of party identification as a set of programmatic issue positions did not replace partisanship as a group identity, but added onto it. How individuals see themselves and their place in society continues to form a basis of partisanship, just as it did in the 1950s. Each party's social group coalition, however, has changed.

The Republican Party's primary social group coalition includes Christians, people who are religiously observant and devout, Americans who identify as white, those who are married, men, older Americans, wealthier people in states that are competitive and favor Republicans, and Southerners. The Democratic Party is favored by Jewish and agnostic/atheist Americans, those who rarely attend religious services and whose religion is not an important part of their everyday life, Americans who identify as black and Asian, non-Southern Americans who identify as Hispanic, those who are single, women, young Americans, lower-income people, those with postgraduate degrees or without a high-school diploma, and those who live in the Northeast or West Coast. These partisan demographic differences have generally grown over the last two decades.

Importantly, these social group coalitions often align with the two parties' ideologies as well. Nevertheless, this partisan phenomenon fits well with a different theory of political behavior: The **social identity theory of partisanship**. The social identity theory of partisanship argues that Americans identify with a party on the basis of its social group coalition and whether they fit into it. Effectively, this means that Americans ask

themselves "which party has people like me?" and identify accordingly. Social identity theory also includes identification with a party on the basis of familial ties (which party individuals were socialized into by their parents) and which party is popular among one's generational cohort as one becomes politically active and aware. This understanding of partisanship is powerful and deepens understanding of the process of party identification. However, social identity theory has difficulty explaining why Americans who don't match a party's social group coalition would identify with it (such as why a single, lower-income female who identifies as black would be a Republican) and has no role for ideology and issue positions. It also has difficulty describing why individuals who fit a party's demographic base well would identify as independent.

Contemporary research shows that the rational choice theory of partisanship generally outperforms social identity theory in explaining partisanship (Abramowitz and Saunders 2006). However, for some large and politically important groups of Americans, such as people who identify as black, social identity theory describes the meaning of partisanship much better. The rational choice and social identity theories of partisanship are the two most prominent and competing theories that explain the meaning of party identification in the American public. Both theories have long and valuable lines of historical research corroborating them. However, they are not necessarily in conflict. For many Americans, *both* rational choice and social identity theory describe why they identify with a party well.

The rational choice and social identity theories are not the only explanations of partisanship. Recent research (Gerber et al. 2012) has revealed another facet of partisanship: Personality. The **personality theory of partisanship** shows that an American's score on the "Big Five" personality traits also explains why he or she identifies with a party. The Big Five personality traits, known also by the acronym OCEAN, are increasingly prominent in social science research on political behavior. This is partly due to the ease of measuring them on surveys (with as few as 10 questions) and partly due to their explanatory power. The OCEAN traits are openness to experience, conscientiousness, extraversion, agreeableness, and neuroticism (or emotional stability). Those high in openness are creative and enjoy trying new things; those high in conscientiousness are punctual, reliable, and care about duty; extraverts are outgoing and talkative; agreeable people are kind and warm; and those high in neuroticism experience more emotional ups and downs and anxiety.

Even accounting for other factors, those high in openness to experience and neuroticism are more likely to be Democrats. Those who are more agreeable are slightly more likely to be Democrats. The conscientious are more likely to be Republicans, and extraverts are weakly more Republican as well. While this personality theory of partisanship is still emerging, it adds considerably to the understanding of party identification in the American public. However, both the rational choice and social identity theories considerably outperform the Big Five traits in predicting an American's partisanship. Therefore, the personality theory of partisanship is best considered as a way of adding depth to the understanding of party identification, rather than replacing other theories.

The personality theory of partisanship is additionally valuable because it underscores how far-reaching partisanship is in contemporary American society. If something as immutable (at least after someone's mid-twenties) as personality is now related to whether an American is a Democrat or a Republican, then truly party conflict in American politics will be long-lasting and profound. Political scientists see some additional evidence of this in lifestyle choice as well; consumer preferences like food, drink, and entertainment choices often are correlated with partisanship today.

## How Partisanship Affects Political Behavior

Given the profound meaning of partisanship in the contemporary American public, it is not surprising that it drives almost every aspect of political behavior. Party identification determines voter turnout. Democrats and Republicans are considerably more likely to vote regularly than

Independents, especially those who don't lean toward either party. Individuals who identify with a party are also more likely to be politically informed, volunteer for a candidate, participate in unconventional political activities like protests or boycotts, talk to a friend about politics, and give money to a candidate.

Once an American enters the voting booth, party identification explains most of his or her candidate choices. Split-ticket voting (the practice of voting for candidates of different parties for different offices) was common in the 1970s and 1980s; it is rare today. Instead, both Democrats and Republicans commonly practice straight-ticket voting and vote for all the Democrats or all the Republicans on the ballot.

This practice has important consequences for campaigns and elections. In presidential elections, 85–95% of partisans will vote for their party's candidate for president. This percentage is almost as high when Republicans and Democrats are voting for candidates for the US House and Senate. In recent years, straight-ticket voting has started to characterize how Republicans and Democrats vote in gubernatorial and state legislative elections as well. This means that elections for state government offices are now often determined by national party considerations! Partisans see almost everything through the lens of party identification.

## Conclusion

Partisanship is the most important factor affecting American political behavior today. The Democratic Party and Republican Party are entrenched and far-reaching institutions in American politics, among both officeholders and individuals. The structure of American elections and government is the primary reason for the two-party nature of American politics. Despite initial opposition from the American Founders, parties arose for practical reasons and have persisted ever since. Perhaps because there are only two major parties in American politics, the meaning of party identification in the American public is deep and far-reaching today. Being a Democrat or Republican today not only encompasses one's views on government policies and purpose but also how one sees one's place in society and personality. These factors have created an increasingly partisan political culture that determines contemporary election outcomes and political participation and that will continue for the foreseeable future.

## Definition

Politics is the means by which a community makes collective decisions about public issues.

## Introduction

This article provides an overview of the relationship between politics and public policy. It will examine what politics is, why it exists, the venues in which it occurs, and the ways in which it can shape public policy. Politics is only one way of determining public policy decisions. Politics will be contrasted with the other ways of making public policy, namely, ideology, expertise, and authority. This article will also examine the sources of politics, the contrast between politics and rationality as sources of policy, and the question of how power is distributed in modern democracies.

## Main Text

Public policy refers to the decisions and actions that are taken by the government when it addresses public issues or those that concern the entire community. Politics refers to the way in which a group seeks to arrive at collective decisions. Politics can occur at different levels, in families, organizations, and communities. Politics within communities involves seeking to influence the decisions and actions that are taken by government in relation to public issues, in other words public policy. Politics refers to a particular way of arriving at collective decisions, namely, one in which people seek to negotiate, persuade, and compromise with others rather than to command or coerce them. Such a view of politics was advanced by the British political scientist Bernard Crick in his celebrated book *In Defence of Politics*, first published in 1962. The reason that politics exists is because people disagree about what the best collective decision would be. Politics is a way in which such disagreements can be resolved peacefully and without the use of authority, coercion, or violence.

Politics is not the only basis upon which public policy decisions can be made. Broadly speaking, we may, following Henry Mintzberg's analysis of organizational decision making, identify four broad sources of public policy. These are politics, ideology, expertise, and authority. Mintzberg sees these four factors as being the main influences on decision making in organizations. We may likewise view them as being the main proximate sources or bases of public policy, since governments are also organizations. Politics and the other three sources of public policy are not entirely separable since people can pursue ideologies when engaging in politics. People can also draw on expertise when engaging in politics and seek to influence or control authority by means of politics. Ideology and expertise become alternatives to politics when power holders in government seek to base their policy decision upon ideology or expertise rather than upon a process of persuasion or negotiation. Expertise shapes public policy when decisions are based on a process of rational analysis and expert knowledge rather than upon a process of "mutual adjustment" between different policy actors such as negotiation and bargaining. Authority shapes public policy when governments make decisions on their own without consulting with nongovernment actors and then impose these decisions upon them through the use of their authority. Politics shapes public policy when decisions are arrived at as a result of a process of negotiation, persuasion, and compromise. A typical example is voting undertaken by a deliberative assembly or negotiation between government and interest groups.

Politics occurs when there is a division of opinion within a group about what course of action to undertake. Such a division of opinion may arise because people's interests are differently affected by the decision. Some people may be adversely affected, whereas other may benefit. The fact that there are winners and losers from public policy decisions means that people's interests differ. People will seek to protect their interests if they are going to be harmed by a decision. Prominent examples of policy fields where such material interests are at stake include tax policy, social welfare policy, and trade policy. Another

reason why people hold different opinions about a policy issue is because they have different values and therefore take a different view about the desirability of various courses of action. While politics is often thought as being about the pursuit of material interests (as in Harold Lasswell's celebrated definition of politics as "who gets what, when, and how"), politics is as much about the pursuit of "ideal interests" as it is about the pursuit of material interests. Studies of voting in many nations over recent decades show that the link between social class and voting preferences has weakened and that many political disputes are about moral and social issues rather than economic issues. Contemporary examples include "quality of life" issues such as the environment and moral issues such as abortion, stem cell research, euthanasia, and "victimless crimes" such as drug taking, prostitution and gay marriage. Many have noted that there is frequently a division of opinion about such issues between "progressives" and "conservatives." Much of contemporary politics is about such moral issues rather than about material interests.

A division of opinion then is a necessary condition of politics as without such differences of opinion there would be consensus and hence no need for politics as a process of reconciling competing interests and viewpoints. In addition to a division of opinion, there also needs to be a decentralization of power within the society for politics to exist. Throughout most of history, power within communities has been centralized and collective decisions have been taken by a minority of people. The terms used to refer to such a form of government vary and include oligarchy, despotism, autocracy, aristocracy, and meritocracy. The world "polyarchy" was coined by the American political scientist Robert Dahl to describe the type of political system in which power is not centralized but decentralized and shared among multiple power holders. Another word for such a system is "pluralism." Within a polyarchy, we find that power is shared by a number of different social actors rather than monopolized by a single actor. Where power is shared, policy decisions are the outcome not of the exercise of authority in which government seeks to impose its preferences on other policy actors but of negotiation, debate, and compromise. This is the case within liberal democracies where governments share power with interest and advocacy groups and with civil society broadly. Within authoritarian political systems by contrast, power is monopolized by government rather than shared with others, and decisions are the outcome of authority or power rather than of politics.

The exercise of power per se then is not politics. Politics as an activity consists of debate, discussion, negotiation, voting, compromise, and bargaining rather than of the issuing of commands and obedience to such commands. The idea of politics then is closely associated with ideas such as those of civil society, the public sphere, and democracy. Civil society refers to the sphere of social life that lies outside the domain of the market, government, and the family. It comprises associations, clubs, advocacy groups, trade unions, political parties, and nongovernment organizations. The presence of civil society can be seen as a precondition of politics. For example, Aristotle saw politics as arising from the existence of different groups, different interests, and different traditions, in other words, an aggregate of many members rather than a single group. The notion of a public sphere identified by the German social theorist Jurgen Habermas also has similarities to the idea of politics as it involves the notion of a social domain in which different groups and individuals can discuss matters of public interest and thereby influence government.

Politics then arises within diverse societies that contain different interests and viewpoints and in which disputes between such interests are resolved by means of negotiation, discussion, voting, and compromise rather than by means of the exercise of power or force. Violence then is an alternative to politics, since people can resolve a conflict by seeking to force their antagonists to submit to their will. Such violence can be exercised by the state as in the case of tyrannical forms of government which suppress dissent and seek to prevent the emergence of any opposition to themselves. It can also be exercised by non-state actors such as private militia and private armies, subunits of a state that secede from a

state, and by popular movements. Civil war and revolution as well as tyranny are therefore alternatives to politics. To engage in politics is therefore to abjure violence as a means of resolving disputes.

Coercion, authority, and violence are alternatives to politics in the sense that they are ways of resolving disputes that do not involve persuasion, debate, negotiation, and compromise. Another alternative to politics is ideology. Ideology can be defined as a set of beliefs about the political, economic, and social order and set of preferences about how such orders should be constituted. Examples of ideologies include liberalism, socialism, conservatism, Marxism, and fascism. As we noted earlier, one of the sources of politics lies in the fact that people often hold different values. Ideologies express such values and provide a rationale for them. Politics can be a means by which people pursue such ideologies. Ideology replaces politics when public policy is shaped by a set of beliefs and associated values about how society should be ordered rather than by discussion and debate. Examples of types of government in which this occurs include totalitarian states and theocracies. In each case, the government seeks to structure society in accordance with an ideology or religious doctrine by using coercion, authority, and indoctrination. Totalitarianism was best exemplified by the Nazi and communist dictatorships of the twentieth century. Within Western Christendom, a separation between the church and state existed, but in Orthodox Christianity, the church and state were one. Within Islam likewise there is no separation of mosque and state. In totalitarian states and theocracies, public policy is shaped by ideology and religious doctrine rather than by politics.

For example, the Soviet Union sought to create a socialist society by abolishing private property in the means of production and establishing a command economy. Maoist China did likewise. Nazi Germany sought to expand its territory by launching a war against the Soviet Union in 1941 and to create a racially pure society by conducting a genocide of the Jewish people in Europe and of other unwanted minority groups. In such cases public policy is shaped by a combination of coercion and ideology rather than by politics. In totalitarian societies, the state seeks to eliminate the pluralism that underlies politics by seeking to indoctrinate all members of society into the ideology. People in such instances will share the same worldview and values, and the disagreement over values that underlies politics is thereby eliminated. In such cases, there is no longer a "need" for politics, since everyone agrees on what to do. Karl Popper saw in the Nazi and communist dictatorships an attempt to recreate the unity that had characterized tribal societies. He contrasted such "closed societies" with the "open society" represented by liberal democracy. In closed societies, thinking is governed by "taboos" which prohibit the questioning of certain ideas, whereas in open societies, ideas can be debated and challenged. Politics requires the existence of an open society or one in which people can freely express their opinions and in which ideas and authority can be challenged.

Politics as a way of creating public policy may therefore be contrasted with coercion, violence, authority, and ideology. It may also be contrasted with expertise or science. Expertise differs from ideology in that it is based on reason and evidence rather than on faith and conviction. We may accordingly contrast religion and ideology on the one hand with science on the other. In the case of the two former kinds of belief system, the content of belief reflects peoples' values and desires. For example, socialists see equality as being the supreme value, whereas for liberals, it is liberty. In the case of science, the content of belief reflects the character of reality. Scientific knowledge has been tested empirically to see if it is valid. Such a process of verification does not occur in the case of religion and ideology. Science or expertise can be a source of public policy. This occurs when people seek to base public policy decisions on verified expert knowledge of what does and does not work.

A major debate within the study of public policy has been about the relationship between politics and rationality. Some argue that public policy decisions should be based on rationality rather than on politics. Such a viewpoint is often espoused by bureaucrats and policy analysts. At

the basis of this belief lies the conviction that it is possible to make objective, rational, and value-free assessments of policy issues and to arrive at a decision that is "best" for the community as a whole. Such an approach underlies "rational" approaches to decision making such as cost-benefit analysis. Advocates of this approach argue that we can identify policy options, rank them in terms of their suitability for attaining a given outcome, and select the one that is best, that is, that is most likely to result in the attainment of the desired outcome. This view underlies the idea that we can separate "politics" and "administration" as activities. Politics is assumed to be the process of selecting policy goals, whereas administration is the process of selecting the best means of attaining those goals. The former of these activities is the province of the politician, whereas the latter is the province of the administrator or official.

Critics of this view argue that rationality can never supplant politics in policy making. This is the case for a number of reasons. First is the fact that judgments about what is "best" are inevitably based on people's values and preferences. The fact that people hold different values and therefore subscribe to different notions of what is "best" means that policy making inevitably remains a matter of debate, conflict, and negotiation rather than of disinterested analysis. This is the case even if such judgements concern not the ends of policy but the question of what is the best means of attaining them. Critics therefore argue that we cannot cleanly separate politics and administration as activities. Even within authoritarian political systems, we encounter "bureaucratic politics" in which different agencies take different viewpoints regarding the desirability of certain policies.

Such bureaucratic politics also occurs within democratic political systems where it is often known as "departmentalism." This refers to the tendency of particular departments or agencies to habitually take particular policy positions or "lines" on policy issues. For example, finance departments typically seek to reduce government spending since their role as the central agency responsible for exercising control over spending departments is to restrain spending. Other departments likewise adopt particular policy lines which are shaped by their function or role. The idea that we can have an objective or impartial analysis of policy issues is belied by the fact that administrators themselves often advocate different solutions to policy issues. Writers have drawn attention to the fallibility of analysis or the fact that people often do not know what the best solution to a policy issue is given its complexity, the uncertainties about the outcomes of actions, and the limitations of human cognitive capacities.

Another problem with the view that it is possible to replace politics with rationality is that policy issues involve the self-interest of different policy actors. The fact that policy actors have different interests which may conflict means that policy making involves argument and negotiation rather than rational analysis. Rationality itself is subject to limitations in the sense that a comprehensive analysis of all options may not be feasible, given the limitations of time and money. Many students of public policy have noted that we do not find "comprehensive rationality" in which all possible options are considered and analyzed but "incremental analysis" in which policy changes in small increments. Power within polyarchies is shared among different policy actors rather than centralized in the hands of a single actor. Decision making within polyarchies therefore involves the political process of debate, negotiation, and compromise rather than a choice made by a single all-powerful agent.

Students of public policy making have, for example, noted the emergence in recent decades of "governance" as opposed to the "government" within the policy making processes of liberal democracies. Whereas government involves a centralized executive making and executing decisions in isolation and imposing them on other policy actors, governance involves the sharing of power between the executive and other policy actors such as interest groups. The term "policy community" has emerged to describe the fact that policy is made by negotiation between politicians, government agencies, interest groups, courts, and the mass media. The term "policy networks" has also been used to describe the way in which policy

emerges from process of collaboration or "mutual adjustment" between policy actors. Politics occurs within policy communities and policy networks in so far as policy actors possess different material and ideal interests which are reconciled by means of negotiation, bargaining, and compromise. To understand policy making within such communities, we need to pay attention to how different policy actors interact rather than to focus exclusively on the formal institutions of government such as the legislature and executive.

Politics as an activity occurs in various venues. There is electoral politics when parties or individuals compete to gain electoral endorsement. Much of this occurs within the mass media in the form of political advertising and news reporting. Within parliamentary systems of government, there is parliamentary politics which arises when government and opposition confront each other in parliament. In multiparty governments that involve coalitions between different political parties, there is a politics that occurs within such governing coalitions. Within systems of government in which there is a single governing party, there is intraparty politics which occurs when candidates and politicians compete against each other for preselection and advancement and when engaging in political debates and controversies. Within the bureaucracy, there is bureaucratic politics. This occurs within government agencies when individual bureaucrats pursue sectional agendas. It can also occur between agencies when they engage in political conflict behind closed doors out of the public gaze. There is also politics within policy communities when politicians, bureaucrats, the media, courts, and interest or advocacy groups seek to influence government decision making. In federal systems of government, there is intergovernmental politics that occurs in negotiation and bargaining between the state and federal governments. At the broadest level, there is international politics when states deal with other states via negotiation and diplomacy.

In addition to these venues of politics, there is also the question of what role politics plays in shaping public policy. Other ways of creating policy include expertise, ideology, and authority. Governments hold the formal authority to make and implement policy. Politics is one means by which other policy actors in society such as the public, interest groups, and the media can influence the decisions that governments take. Political systems vary in the extent to which they permit politics to play a role in policy making. Within authoritarian and one-party states, the role of politics is extremely circumscribed as the state controls civil society and the media. There are often no independent political parties, advocacy groups, and independent media that can give voice to the concerns of the public and of non-state actors. Politics within such political systems occurs not in public venues but in private, in the form of intraparty and bureaucratic politics. Within such political systems, public policy is mainly shaped by a mixture of authority, expertise, and ideology with a limited role for politics. Within liberal democracies or polyarchies, power is not monopolized by the state and there is room for non-state actors to shape policy. The holding of periodic elections ensures that politicians must account to voters for their actions and thereby gives the general public some influence on public policy. The existence of an independent media and of advocacy groups means that non-state actors can influence the policy agenda and thereby the decisions taken by the state. This view of the policy process sees it as exemplifying "pluralism" or a dispersion of power throughout society rather than its concentration in a single monolithic authority.

Some writers question this depiction of the way that public policy is shaped within liberal democracies. They argue that the distribution of power within liberal democracies is unequal and in particular that certain interests have more power than other types of interests. Writers point to the "privileged position of business" in the policy making process. Business occupies such a position since it controls investment in the economy. Governments in a sense share power with business since within a market economy it is the price mechanism rather than government fiat that determines the distribution of goods and services. Business also enjoys reserves of wealth that enable it to fund lobbyists to act on its behalf and to make donations to politicians who are business friendly. It is argued that governments can only govern with the "consent" of business since if governments take actions that are inimical

to the interests of business, then business will seek to overturn such decisions or withdraw their investment. In an age of economic globalization, capital is mobile and can be withdrawn from nations that are regarded as being business unfriendly and reinvested in those nations that are more receptive toward the interests of business. Others draw attention to the way in which public opinion is shaped by the mass media and to the way in which ownership of the media is concentrated in the hands of wealthy media proprietors who favor pro-capitalist policies.

Habermas saw the public sphere as being an arena in which different viewpoints could be voiced and in which people could engage in dialogue about issues of public importance. In modern societies, the concentration of power in the hands of a handful of media proprietors and the predominantly one way nature of communication within television, radio, and newspapers means that instead of dialogue we find a situation where public opinion is molded by media indoctrination. Marxist writers allege that there exists a form of ideological hegemony in which the ruling class exercises power over the subordinate class by means of indoctrination and ideology. Such a viewpoint sees modern liberal democracies as being akin to totalitarian states in so far as people in both cases undergo indoctrination. The difference is that in the case of totalitarian states the mass media are controlled by the state, whereas in the case of liberal democracies, the mass media are controlled by the capitalist class. In addition to the role of the mass media, exponents of the thesis of ideological hegemony point to the role of the education system in inculcating pro-capitalist ideas in people. Such critics of capitalist liberal democracy see government as being antipolitical and essentially authoritarian since public opinion is shaped by indoctrination. Some issues (such as the highly unequal distribution of wealth and income) rarely make it onto the policy agenda because they are not seen by most people as being a problem. If we take this viewpoint, then the role of politics is more restricted than many imagine it to be. Policy choices do not reflect the influence of politics but the influence of power. Others argue that politics does matter and point to the fact that different nations adopt different policies. Such differences reflect the role of different political forces within each nation.

Politics can play a role at different stages of the policy process. The first stage is that of agenda setting or problem definition. Issues get placed on the policy agenda as a result of the efforts of political actors such as politicians, interest groups, and the mass media. The definition of policy problems also reflects politics since people define problems in different ways depending on their values. Here political ideologies play an important role since ideologies such as liberalism, socialism, and conservatism portray society in different ways and provide different explanations for social problems. Definitions of problems will in turn shape how people select solutions to problems. For example, if we see the problem of unemployment as being due to an unwillingness of the unemployed to find jobs, then the solution that we favor is likely to be different to that of someone who sees unemployment as being due to an absence of job opportunities. The next stage of devising solutions to problems occurs mainly within the executive arm of government and in particular within the bureaucracy. Here we encounter bureaucratic politics. In implementing policy solutions, there can also be a "politics of implementation" as different policy actors seek to secure different outcomes by means of negotiation and bargaining.

Finally politics occurs in different institutions. Institutions in this context refer to the way in which politics is structured through rules and the way in which power is distributed and regulated. Examples of political institutions include constitutions, electoral systems, political parties, laws, courts, the mass media, interest groups, executives, and assemblies. Political systems differ markedly in terms of their institutional structures. We may broadly differentiate between authoritarian and polyarchic or democratic systems of government. Within the former, the role of politics is circumscribed as decisions are taken by those in authority without much influence being exercised by nongovernment actors. Within democratic political systems, the role of politics in shaping public policy is much greater as the topmost power holders in government are elected by voters. Different political parties within

democracies seek to gain office by competing for the people's vote at elections. Interest groups and advocacy groups seek to influence the decisions that are taken by government by lobbying politicians and officials and by using the mass media to voice their opinions and to influence public opinion. The mass media within a democracy is not controlled by government and can exert influence on government and act as an organ of public opinion. Within assemblies such as parliament, governments can be questioned and held to account for their actions by the opposition. Where there is a "division of powers" between the executive, judiciary, and legislature, each arm of government can act as a check and balance on the powers of the other arms of government. Within federal systems of government, power is divided between state government and the federal government, and there can be a politics of federalism in which the federal and state governments seek to negotiate policy outcomes.

## Conclusion

Politics is the means by which a community makes collective decisions. Such decisions when taken by government take the form of public policies. Politics may be contrasted with authority/coercion, science, and ideology as ways of making policy decisions. Politics occurs when people disagree about collective decisions and when power is decentralized. In these instances, people seek to persuade, negotiate, and compromise with others in order to reach a collective decision. By contrast, where power is centralized, collective decisions are imposed by a central power holder upon others. In making such decisions, power holders may be guided by ideology or science. In the latter instance, decision makers seek to make the "best" or most rational decision, that is, to select the means that is best adapted to the attainment of a given end. The limitations of the rational model of decision making entail that politics plays a role in public policy making. We may contrast authoritarian political systems in which power is centralized with polyarchic or democratic systems in which power is decentralized. Politics plays a greater role in shaping public policy in the latter. The extent to which power is actually decentralized within democracies has been a matter of debate with some academics arguing that business wields disproportionate power compared to other groups. Politics occurs in different venues and at different stages of the policy process and occurs within different institutional contexts.

## Synonyms

Cell tower base sites; Cell tower politics; Cell tower procurement; Cell tower regulation; Information communication technology; Milliwave

scanners; Mobile communication; Radio frequency towers; Telecommunications Policy; Wireless base sites

## Definition

The public policy matters including legal, statutory, and public health issues, and political factors governing and inherent to the procurement, placement, presence, and use of devices that provide wireless communications and remote capabilities through technological utilization of the electromagnetic wave spectrum.

## Introduction

There has been substantial policy discourse regarding the procurement of wireless communications base sites including cell towers. As wireless facilities continue to be installed on playing fields at parks and schools, next to or on top of government buildings, and near residential areas including neighborhoods and shopping centers, it is becoming increasingly difficult to identify places where wireless facilities cannot be found. Proponents to widespread installation of wireless facilities argue that the public demands universal service connectivity while opponents express concern over aesthetics and health issues with regard to the presence of electromagnetic fields. The political debate has intensified as wireless companies now argue that it is safer for subjects to have cell towers erected nearby, equidistant from each other, as this allows for a less powerful signal to be transmitted across landscapes between towers.

The politics by which public entities such as schools and government agencies procure wireless facilities as a revenue stream, and adopt wireless technology capabilities, can be illustrated according to political narratives. The purpose of this entry is to explain the public policy and political issues regarding the procurement of wireless facilities. The stakeholders, legal mandates and statutes, policy issues, procurement process, and prevailing narratives will be explained to frame the topic for policymakers and the public in order to establish bases for continued research and discourse.

Through radio frequency electromagnetic wave (RFEMW) technology, advancement, communication, transfer of data, pinpoint surveillance, image scanning, and digital interventions can be achieved on an interspersed, distributive scale by transferring electromagnetic pulses through air. Government and regulatory agencies bestow the power to monitor and transmit information and high-powered signals between networks and across both geographic and orbital areas. However, as RFEMW devices begin to embody newfangled high frequency and wavelength technologies, some concerns have arisen. Steinfeld (2014) illustrates the political context elements dictating public policy outcomes in the RFEMW regulatory sphere, a socio-administrative process devoid of public interest. Meanwhile, there are health concerns with the spatial-proximate elements of having populations live, work, and play near RF towers and pads, or in zones where signals are being transmitted across, called radio frequency electromagnetic fields (RFEMF). Nonetheless, consumers' positive disposition toward RFEMW, the transmission technology used for cellular service, has been widespread as evident by the popular ownership of mobile devices and apathy toward milliwave scanning machines when entering secure areas such as airports.

## Public Policy Matters

From regulatory and governance standpoints, there are a host of public policy issues to address given the statutory and legal foundations currently in place, which are lacking altogether in terms of public concern and consistency of public policy implementation. As the ruling authoritative body, the Federal Communications Commission (FCC) is required by the National Environmental Policy Act of 1969 to evaluate the effect of FCC-regulated transmitters on humans and the environment. Several organizations such as the American National Standards Institute (ANSI), the Institute

of Electrical and Electronics Engineers (IEEE), and the National Council on Radiation Protection and Measurements (NCRP) issued recommendations to the FCC regarding human exposure to RFEMF.

Yet, current guidelines for the building of new physical sites and modification of existing sites stipulate that an environmental assessment is not required if the particular facility, operation, or transmitter does not cause human exposure levels beyond the allowable levels (Federal Communications Commission 1997), insinuating a level of trust be granted to RF tower installation and maintenance companies, operators, and wireless service providers to begin with. To explain further, the apparatuses necessary to test RF strength levels are difficult to obtain, and unless a gauge is affixed to the device being tested at all times with seamless communication to inspectors, then there is no way to confirm that RF base sites are conforming to strength of signal guidelines on continual bases. The allowable levels are categorized according to the NCRP's Guidelines for Evaluating the Environmental Effects of Radiofrequency Radiation, which are determined by distance from source, wavelength band, and transmitter power (Federal Communications Commission 1997). The categories include allowable levels at extremely high frequency (EHF) and very high frequency (VHF) and are stipulated therein not to exceed a power of 500 watts at a wavelength band of 160 m, but the allowable wattage is provided as a scale/range, which significantly decreases to 50 watts when the wavelength band is 10 m (Federal Communications Commission 1997).

With no scientific or experimental data explicitly cited by the FCC to support these thresholds, it can be inferred that these values are somewhat arbitrary, especially considering they do not consider length of exposure. The FCC's guidelines for radiofrequency radiation are questionable in the simple sense that an RF device cannot alter the power of its RFEMW according to the many subjects circulating the environment simultaneously at various distances. For example, a resident's home may be absorbing an RFEMW field strength of 500 watts from an RF tower 1 mile away, but that does not change the fact that if a resident drives by that RF tower on the highway that the resident is not being exposed to the same 500 watts of power, except this time at only 100 m. In the event that the more powerful RF towers are placed in areas where bystanders cannot get close enough to them to exceed the FCC guidelines then the aforementioned thresholds may make sense, but in the vast majority of visible RF towers prevalent in communities, the metrics being utilized by the FCC to determine allowable human exposure levels to RF radiation seem to require some fine-tuning. Even if the distance between residents (RF subjects) and RF towers could be controlled: Who is to determine how much RF exposure each resident is willing to accept? Furthermore, as mentioned, the particular FCC guidelines do not consider thresholds with respect to exposure length of time.

Not only has regulatory enforcement of effective, if not acceptable, guidelines been abysmal, US federal government has in some ways facilitated the interests of wireless service providers and related ancillary technology industries. Essentially, federal government has facilitated the streamlined implementation of RADFIT devices, including tower base sites, by wireless service providers. According to the Telecommunications Act of 1996, Section 332(c)(7)(B)(iv), "No state or local government or instrumentality thereof may regulate the placement, construction, and modification of personal wireless service facilities on the basis of the environmental effects of radio frequency emissions to the extent that such facilities comply with the Commission's regulations concerning such emissions." As explained, the FCC's allowable emissions levels are either being fundamentally misapplied in terms of gauging allowable RF strength and distance parameters or fail to address issues with regards to length of time exposed. Additionally, the installers of tower base sites may legally forego environmental evaluations if local government or authoritative jurisdictional bodies do not contest signal strength, according to Sect. 332 of the Act. More broadly, Section 253(a) further fastens carriers' rights in stating "No state or local statute or regulation, or other state or local legal

requirement, may prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service."

Other regulatory issues relate to competitive markets. In conjunction with the aforementioned limitations of the Telecommunications Act of 1996, Section 214(e)(1)(a) grants telecommunications carriers eligibility to provide their own telecommunications facilities in areas designated as "universal service." This means that even if a wireless service provider has already installed an RF tower that sufficiently provides connectivity to area residents, public administration entities, and other corporate stakeholders, a wireless carrier competitor still has the right to install an RF tower in order to promote their own company's service connectivity to customers. Thus, there is an overabundance of RF towers and the amount of RFEMW in the environment is consequently excessive and more powerful than needed.

In addition to the legal and statutory issues in the public policy of wireless facilities, there are numerous public health issues that emerge with the development and use of radio frequency information technology (RADFIT). RADFIT denotes the broad field of study that deals with transmittal and collection of data and information through RFEMW as well as the ability to use such technology to trigger various mechanical or biological interventions. As examples, RFEMW has been used to destroy carcinogenic cells in humans, as a way of altering plant growth, and in various forms with regard to marine sciences, exploration, and defense systems, to name just a few. Based on widespread utilization of RADFIT applications, health concerns, privacy rights, and regulation of the environment are policy matters that are being addressed and are slated to attract increasing attention by political actors. There is concern regarding the safety of RFEMW, in terms of surrounding RFEMF's that are created by transmission of waves between devices, cloud technologies, and the waves being emitted by towers and security scanning apparatuses.

Common outcries against those who denounce excessive use of RFEMW or wish to subside its impact on communities revolve around the argument that there is not conclusive scientific research that indicates RF towers and related RADFIT is hazardous. However, Steinfeld (2014) cites numerous studies, many of which have been conducted by the National Institute of Environmental Health Sciences (NIEHS) and other academic scholars and researchers, which indicate that RFEMW has been found to negatively affect health of small mammals, plant life, and even humans. Other studies conducted by independent research bodies have cited concerns regarding human insomnia, brain disorders such as the onset of attention deficit, psychosis, depression, and other mental health issues.

Challenges to the current research on consequences to health from RFEMW absorption revolve around the fact that many studies indicating the dangers of exposure use small mammals such as rats or microorganisms for testing. The argument here is that human beings may be more resilient than these other smaller living organisms, an argument with inherent risk and a grand assumption that humans are exceptionally powerful and superior to other species. There is an excess of qualified medical doctors and scientists who have been able to isolate the specific and exact negative impacts of RFEMW exposure on molecular and cellular bases of the human body that far exceeds the evidence of health hazard provided herein, evidence that is easily obtainable from the National Institutes of Health U.S. Library Medicine database. Medical professionals at the NIEHS have also published results indicating the health hazards of RFEMW, although its official organizational position is that the research outstanding is inconclusive.

Just as in the social sciences, it is expected that there are numerous factors driving the findings of experimental studies including the hypothesis, data collection, methodology, and research design, or empirical issues that emerge including reliability, validity, generalizability, and exogenous variables. With differing results and an over-flux of varied studies that each test particular kinds of exposures to RFEMW, it becomes difficult to accumulate the findings from a standpoint of public health. It cannot be agreed upon which study provides the conclusive evidence as to the

safety of human absorption and environmental effects of RFEMW; each study focuses on exposures at specific frequencies or wavelengths according to a seemingly unique test of different biological and physiological aspects of the living organism. Thus, with the scientific findings to a large extent neutralized in terms of determining public health risks, it is the regulation and public policies that are centrally important in governing electromagnetism.

Based on the varying opinions of scientists and experts who have conducted studies on health effects, and given the newness of the technology, it is unfounded to attempt to devise guidelines for maximum absorption and power. It could even be argued that no level of RFEMW is safe or acceptable. However, people's everyday personal and professional lives rely on mobile communication, and increasingly electromagnetism is becoming inhabited into the environment, such as biotechnology and bioenergy applications, where electromagnetic fields can be used to achieve metabolic effects on plants and living organisms, or serve to detect changes in conditions where mechanical interventions are necessary to support infrastructure. It is difficult enough to try to determine experimental causality between electromagnetism and health concerns, and then to try to establish risk-return parameters for its use regarding the extent to which public health should be risked for public wealth. It becomes especially difficult when the "thing" being debated and measured is invisible.

When considering the most prevalent application of RADFIT across communities, the main technology behind RFEMW involves the flow of electrons from and between RF base sites to mobile devices. When these electrons hit a human subject, then the atomic make-up of that subject is modified. A given material is composed of atoms. Each atom consists of electrons orbiting a central positive nucleus; electrons also spin around their own axis. The orbital array of activity occurring between protons and electrons in atoms results in orbital disarray and unpredictable movement of electrons. When an RF field is applied, the subject's atom movements are impacted from the infusion of electrons, creating a magnetic moment in the human body.

Despite experimental results that indicate harmful effects of RFEMW exposure to humans, there are many policy advocates and users of the technology who disregard health concerns based on risk-reward trade-offs. A vast majority of jobs in today's workplace require regular, if not constant, use of RADFIT devices through wireless technology, not to mention personal utilization by means of mobile phones. Humans' presence in wireless environments that support Wi-Fi networks and cloud computing represents continuous exposure to intermediate levels of static RFEMF. Exposure to static RFEMF occurs at numerous community locations; anywhere RF towers or devices are mounted such as at schools, post offices, municipal buildings, or simply at the placement or receipt of a mobile phone call. Also, a majority of technical occupations require the use of handheld devices to communicate with clouds and input information for the purposes of corporate data mining, communication, or operational setup.

Regardless of the source or reason for exposure, the overwhelming presence of RADFIT devices and the necessary supporting RFEMF has become widely overlooked and accepted. Just as there are cardiovascular risks to living in populated urban areas and geothermal risks to being near the sun during air travel, most people accept these risks as being minimal or a cost of "doing business" or "surviving" in a modern society.

## Political Factors

Beyond legal and statutory frameworks governing public policies, U.S. federal government has largely deferred to local government, or community organizers, when it comes to making decisions about placement of RF towers on an individual, site-by-site basis. As a result, there are inconsistent outcomes for residents across the country and world, or even within counties and cities. One of the first documented successful rejections of an RF tower proposal at a public school was recorded by the Students Against Cell Towers (SACT) organization of Wootton

High School in Rockville, Maryland (Steinfeld 2013). Despite the organization's ability to reject an RF tower at Wootton High School, the towers at nearby schools remained in place and other community schools were forced to fight their own fresh battles, involving new residents, government decision-makers, and wireless service providers. Due to the lack of organized efforts at the grass-roots level, there are hundreds of local advocacy groups that have formed to reject the placement of RF towers at public schools or other residential areas throughout the world (Steinfeld 2014). A similar example of inconsistent public policy implementation can be seen in Palm Beach County, Florida, where a moratorium was put into place forbidding placement of RF towers at public schools, but the ten towers that were erected at public schools prior to the moratorium were left in place.

These community voluntary initiatives present their cases to school principals, superintendents, parent-teacher associations, school boards, and court judges. The decision to allow or disallow the placement of an RF tower thus falls on different decision-makers at various points in time of the RF tower placement process. For example, if a school principal rejects a wireless service provider's soft proposal and blueprints for an RF tower at that location, then the RF tower placement effort may be pronounced dead at an early stage before the public is ever aware of the consideration. In other cases, such as a subsequent 2014 initiative in Montgomery County, Maryland, the county where the city of Rockville is located, residents became heavily involved in the political process in opposition to a county-wide initiative that was set forth to systematically install RF towers at numerous schools and recreational sites, including public parks. Ever since SACT's successful opposition to the Cingular Wireless proposal to install a cell tower at Wootton High School in Rockville from 2003 to 2005, the state of Maryland has become a hotbed regarding the issue of cell towers, and thus serves as a great example for politics on the matter.

High schools that previously rejected RF towers in the past, such as Wootton High School, experience repeated targeting by wireless service providers years later, such as in the case of AT&T's 2014 proposal to erect an RF tower at Wootton High School, roughly 10 years after the community's successful campaign against Cingular Wireless. While grassroots political leaders and community organizers may move on to other full-time endeavors professionally, the wireless service providers remain steadfast in their ability to approach communities some day in the future. Additionally, decision-makers such as school principals, school superintendents, county executives, and state representatives may move on to different positions, leaving new actors to make decisions on the matter, even though these actors may lack the learned knowledge and expertise to effectively deal with the matter. Like most counties in the US, there are little to no formal rules in Montgomery County that have been established in regards to regulating and governing the political process for installation of RF towers, especially on public grounds. Other heavily populated counties in Maryland such as Anne Arundel County and Prince Georges County have experienced community uproar over RF towers at schools to the extent that community-based RF tower committees have been founded to assist residents' engagement in the political arena.

In cases where RF towers are currently present and cannot be taken down, community residents have gotten creative in finding ways to object to RF towers based on technicalities. In Prince George's County, a Maryland county adjacent to Montgomery County, a resident and parent of two at a local school challenged an RF tower's legality at a public school based on the number of times that the RF tower has been serviced, arguing that the lessee contract specifies that no more than four service calls by humans shall take place on the tower per year, a quota that the resident claims to have been exceeded by the tower operator. Meanwhile, community residents filed a complaint against the Prince George's County Tower Commission arguing that it violated the Maryland Open Meetings Act in making it unclear to residents which 60 public sites would be used for future tower placement. When county-wide initiatives serve the interests of wireless

service providers, then "lone ranger" public administrators aimed at defending communities face widespread persecution by political masses who may be aligned with business interests, and may therefore typically choose to ignore the issue altogether or begin focusing on monetary benefits of RF tower base site rental revenues in hopes of gaining at least bureaucratic, if not public support.

The placement of RF towers at public schools has garnered so much attention in Maryland policy making in particular that Montgomery County Board of Education candidates are being asked about their stance on RF towers at public schools. Also at the county level, the issue has gotten so promulgated that a Transmission Facilities Coordinating Group and a Tower Committee have been formed in Montgomery County. At the state level, government is scurrying to adopt acceptable nomenclature that supports the federal universal service directive while ameliorating local residents' desire for rights, clarity, and consistency on the issue.

There are a number of political narratives that have surfaced in the support or opposition for the presence of wireless facilities base sites. Supporters for widespread placement and use of wireless facilities on public property, such as RF towers at public schools and parks, argue that residents desire ample connectivity such as seamless cell service for mobile phones. Additionally, supporters argue that the presence of more wireless base sites allows for transmission of lower strength signals. This prevailing narrative suggests that when RFEMW travels long distances between cell towers, or between a cell tower and a mobile device, a much stronger signal is necessary as compared to having numerous cell towers where the RFEMW signal strength can be reduced since the distance traveled between cell towers is less.

Additionally, supporters of the presence of cell towers at schools cite the monetary benefits that can be realized. Since wireless service carriers have traditionally targeted lower-income public school districts first when placing cell towers in a community, where parent-teacher associations (PTA) are less adept, find it more difficult to mobilize, and may be more responsive to monetary benefits, lower-income school districts are typically the first to incur the presence of cell towers. Local government officials including school principals and school board decision-makers have argued that schools greatly benefit from the rent charged to wireless service providers for allowing the placement of cell towers on school property. It has been stated that the rent can go to construction of computer labs and other needed educational facilities at the school.

At the same time, it is difficult to put a value on students' health and wellbeing, especially if there are physical and mental health hazards associated with the close proximity of cell tower base sites. Of particular concern is the fact that cell towers are strategically placed near open areas so that RFEMW transmission can take place without obstacles in the way, such as trees or building structures. Hence, cell towers and cell pads are oftentimes erected at school football and baseball fields, which pose an immediate threat to those students at play for several hours day after day. It is the open space surrounding public schools to begin with that makes these grounds attractive places for placement of wireless facilities.

Opponents to the procurement of wireless base sites by public schools have not only posed arguments according to the health risks of RFEMF, but also according to aesthetics and privacy issues. While some community residents are not concerned with health risks associated with RFEMF, many residents oppose procurement of cell towers at public schools or in public spaces due to aesthetic issues, citing the "eyesore" that cell towers can be, as well as the accompanying wireless base facilities on ground level that serve as the computer, or brain of the cell tower. In response, wireless service providers have dressed-up cell towers with various camouflage made to look like tree branches and tree leaves, so as to blend in with the surrounding environment.

Furthermore, some privacy issues have arisen given the ability of cell towers to collect data from holders of mobile devices. For example, the movement of community residents can be tracked from cell towers. Consumer spending behavior is currently being tracked such that data can be collected from shoppers who have a mobile phone in their pocket. As a shopper moves about a store, or

moves from store to store, their shopping habits can be tracked. Also, government agencies can use mobile tracking data to plan for traffic congestion or for purposes of emergency management. While there are benefits to this type of mobile tracking and data collection, especially in cases when a criminal can be prosecuted as a result of evidence obtained from cell towers in terms of a person's location during the time of a crime, there are legitimate privacy concerns as well. Opponents to the presence of wireless facilities at public schools and public parks in particular believe that certain areas should be free from commercial activities.

In addition to the political issues surrounding cell towers, other wireless facilities have garnered attention by communities such as security scanning devices that utilize RFEMW milliwaves to scan passengers entering secure areas, such as the ones placed in US airports. Similar to the case of cell towers, the scientific research regarding health hazards to human subjects is equally debatable, and the political narratives have been controversial as well. First of all, travelers in the US question why milliwave scanning machines are outlawed by the European Union but are acceptable for use in US airports. Also, since children under the age of 13 are not required by the Transportation Security Administration (TSA) to pass through milliwave scanners, and instead may go through metal detectors, passengers are questioning what the health hazards to the milliwave scanners may be. It is believed that the developing body of children may put children at health risk of milliwave absorption, indicating that there is a biological effect that takes place in the body as a result of exposure. If this is the case, then children over the age of 13 may be at risk, as it is unlikely that the human body undergoes substantial changes from the time a child is 12 years and 364 days old to 13 years old. Also, if there is a biological effect that takes place in the human body as a result of milliwave exposure, then adults may wish to avoid this reaction as well, even if it is deemed to be harmless to one's health. Opponents to milliwave scanning devices also argue that the health risks associated with these machines is credible, considering that passengers receiving TSA preclearance are allowed to pass through metal detectors instead. Just as in the case of RF towers, the scientific and experimental research on milliwave scanning yields inconsistent conclusions, even though there is a body of knowledge that indicates these devices pose risks to public health.

## Conclusion

Regulators across a host of nongovernmental organizations (NGO's), international organizations, federal communications agencies, and state and provincial governments are examining a plethora of experimental research on the biological effects of RFEMW and trying to determine safe and appropriate power levels for RF towers and devices. Regulatory bodies need to be transparent in presenting the prevailing scientific research, as there is no shortage of experimental studies that indicate the health risks associated with RFEMW. Instead of proclaiming that the scientific research is inconclusive, governmental organizations can present the research findings as they exist today, in which there are numerous studies that indicate health risks are substantial, despite the presence of some studies that indicate the health risks to be nonconcerning.

The effort to improve public policy and politics on this issue involves planners who must figure out the best placement for RF towers so as to maximize their expanse and connectivity while minimizing the physical intrusion into the community. Thus, numerous public administrative elements are considered such as scientific expertise, the public policy process including urban planning, public health considerations, and the political argumentation that serves to promote narratives for or against specific wireless facilities procurements.

RF towers have become a part of the environment; they appear in the background on a light pole, attached to a nearby building, or in the distance atop a hill. Simultaneously, RF towers are part of their own internal environment; their arrangement in communities and across landscapes represents an intricately planned network of connectivity. The debate surrounding

wireless facilities procurements is centered on the placement of RF towers at public schools, public parks, and other public spaces where residents are in close proximity. Other applications of RADFIT such as the implementation of milliwave scanning machines demonstrate the advent of advanced uses of RFEMW and the continued prevalence of the technology.

This entry argues that the public policies in place governing public procurement of wireless facilities needs to consider public health issues and the varied stances of community residents with regard to the placement of wireless facilities where residents work and play. The public policies may be streamlined so that if one local community rejects placement of a cell tower at a particular school, then all schools in the county, or even across the state or country, should benefit from the successes and mobilization of resource-intensive community voluntary initiatives. On the other hand, reasonable caveats can be put into place to maintain local jurisdiction's autonomy in having the power to make decisions according to the desires of each unique community. However, first public policies can be instituted that serve to represent the interests of community residents, not solely the interests of wireless service providers. Then, in cases where local communities would like to circumvent new, protective public policies, transparent processes and procedures can be made available whereby local communities can overturn such protections. Currently, the opposite public policy stance is in place, in which the procurement process is streamlined on behalf of wireless service providers to enable the speedy installation of wireless facilities with disregard to public interest.

Conservationism; Environmental movement; Environmental policy; Environmentalism

## Definition

Environmental politics concerns the development of political institutions to solve problems of

negative externalities related to the use of natural resources, which occur when costs from some activity or decision are imposed on parties outside the activity or decision.

## Introduction

Environmental politics can most simply be defined as the politics of externalities. All environmental conflicts between humans, or even between humans and nonhumans, can be thought of as being produced by the existence of negative externalities. Sometimes called "spillover effects," negative externalities occur when costs resulting from some activity or decision are imposed on parties outside of the activity or decision.

Two kinds of negative externalities can result in environmental problems. First, simple spillovers may occur when one party's decision about the use of a natural resource immediately and negatively affects another party. An environmental example of this would be a factory dumping hazardous waste into a neighboring lot as a byproduct of production, and the members of the homes around the lot becoming sick because of their exposure to the waste. The owners of the homes surrounding the factory would not be involved in the decisions that led to the dumping of the hazardous waste, and would not benefit from production, but they would bear some of the costs. This can apply to nonhuman parties as well. When humans chop down trees, pollute water, or construct dams, they impose costs onto the nonhuman nature affected by these decisions. Any animals that are affected would bear the costs of the human decisions to change the natural environment.

A second problem that can result in negative externalities is the problem of common pool resources. These problems occur when many parties share a single resource in common, and those using it do not absorb all the costs of their activities. Any one party's use of the resource imposes costs on the other owners of the resource. This is because whenever any one individual makes use of the resource, he or she is preventing someone else's use. Efficient use of common pool resources can be difficult due to collective action problems involved in managing them. Collective action problems occur when individuals acting in their own self-interest results in an inefficient collective outcome for all. The individually optimal outcome leads to a suboptimal outcome for the collective. In this way, management of common pool resources closely resembles the classic scenario of the "prisoner's dilemma," where two men accused of a crime would collectively benefit from cooperating with each other but individually benefit from turning each other in. In this situation, the only equilibrium solution occurs when the prisoners turn on each other, even though it is the worst possible collective outcome.

The same logic that leads to a lack of cooperation in the prisoner's dilemma applies at a larger scale with common pool resources. Rational self-interest leads to collective inefficiency. The classic case of a collective action problem in the use of a common pool resource is farmers grazing their cows on a field held in common. Each individual farmer has an incentive to overgraze the field, despite this leading to lower profits for everyone and the potential destruction of the field. It is the common pool resource problem that most think of when they think of environmental issues. Environmental politics involves examining how humans design (or fail to design) political institutions, both formal and informal, to deal with negative externalities that result from common pool resource problems and simple spillovers.

## Solving the Problem of Externalities

Perhaps the most striking illustration of the collective action problems that occur in the management of common pool resources was made by Garrett Hardin in his 1968 article "The Tragedy of the Commons," one of the most influential works of social science ever published. As he reflects on commons problems like the ones discussed above, Hardin argues that humans as a whole face a problem that mirrors that of the farmers and their cows. All humans share in a common resource in the earth itself and face a

collective action problem in managing that collective resource. Each individual desires consumption of that resource and reproduction of their genes, and yet, Hardin argues this will collectively lead to overpopulation and a terrible outcome for all.

Almost all social scientists are familiar with Hardin's illustration of the tragedy of the commons, but his explanation of the problem is only the first part of his argument. It is the less discussed, and more controversial, second part of his essay that concerns environmental politics as such. Hardin argues that the only solution to the collective tragedy that would result from continued common use of the earth is "mutual coercion." It is only through centralized government force that humankind will be able to stop its insidious march towards overpopulation and overexploitation of resources. Indeed, Hardin argues that the "freedom to breed is intolerable" and that the only way to prevent overpopulation is vigorous government regulation and enforcement of reproduction. He makes similar arguments about common ownership of land, air, and water. In this way, Hardin introduced the fundamental issue of environmental politics to generations of social scientists. When faced with problems of environmental externalities, what kinds of political institutions can be designed to solve them? When individual self-interest will result in suboptimal collective outcomes, what political solutions can lead to optimal collective outcomes?

While Hardin's solution of coercive regulation, also known as command and control regulation, is one possible institutional solution, it is certainly not the only one. The problem of externalities can also be defined as market failures. These occur when market incentives lead to inefficient outcomes. While Hardin's solution to market failures is command and control regulation, market-based policy solutions have also been proposed. While command and control regulation can be costly and inefficient, many economists argue that market-based solutions allow for the maximization of net benefits when efficiency is the goal, and even when quantifiable benefit is not the goal, market-based solutions may allow for the minimization of costs. For much of the twentieth century, the most common market-based solution was Pigouvian taxation. Pigouvian taxation involves estimating the cost of the negative externality and imposing a tax equivalent to that cost. It is important to note that the tax is always on the pollution (or externality) and not on the activity that produced it. In the case of a power plant, the tax would be on the units of $CO_2$ (or other emissions) produced and not on the amount of energy produced. The idea of the Pigouvian tax is that either polluters will pay for their negative externalities, thus fully addressing the costs of their activity, or they will figure out a way to prevent the externality from occurring.

In 1960, the efficiency of Pigouvian taxes was challenged in a seminal paper by Ronald Coase, "The Problem of Social Cost." Coase is widely cited in policy debates but also widely misunderstood. The Coase theorem, which was developed out of the paper, suggests that any initial allocation of property rights will result in an efficient allocation of resources, if transaction costs are zero. Essentially, Coase argued that thinking of polluters and victims is incorrect when it comes to considerations of efficiency. Rather, he suggested that externalities are the result of joint behavior. Pollution can only lead to negative externalities if there is another party available to bear the costs (this ignores the possibility of the environment itself bearing the costs of externalities). He suggested that absent transaction costs (costs, such as uncertain information, imperfect communication, or costly enforcement, which hinder negotiated solutions), all that is necessary for an efficient result is to allocate rights to parties and let the market work itself out through negotiation, regardless of whether the polluter is given the right to pollute, or the party bearing the costs of pollution is given the right to not suffer the externality. He showed that in certain circumstances, Pigouvian taxes would actually lead to less efficient solutions.

Many have misinterpreted Coase to mean that government involvement in pollution is unnecessary and that the free market will figure out the best ways to solve pollution issues. On the contrary, since transaction costs are never equal to zero, the government has a robust role to play in

reducing them. Additionally, it is the government's responsibility to assign property rights in the first place. The 1990 Clean Air Act Amendments, which created the world's first large-scale pollutant cap and trade system, regulating sulfur dioxide and nitrous oxide produced by coal fire power plants, is an example of an explicitly Coasean solution to an externality problem. Rather than use command and control regulation, or Pigouvian taxation, the act allocated rights to a certain amount of pollution through the cap on emissions and then let a market decide how that pollution was allocated among the power plants. Allocating the rights and reducing transaction costs by implementing the market directly involved the government in the process of mitigating externalities. Despite often being misunderstood, Coase provided a new way of thinking about the problem of negative externalities. Rather than Pigouvian taxes or Hardin style command and control regulation, the Coase theorem suggests that the solution to problems of externalities may actually be to assign rights and then to reduce transaction costs, resulting in a more efficient allocation of resources.

While the Coase theorem is certainly a strong alternative to the Hardin solution of mutual coercion through regulation, perhaps the greatest challenge to Hardin's central thesis is the work of Elinor Ostrom. The 2009 Nobel Laureate in Economics, and the first woman to receive the award, Ostrom's work questioned Hardin's idea that command and control governmental regulation would solve the problems in the use of common pool resources. She argued that since perfect information about resources is not always available to central government authorities, and since monitoring and enforcement can be expensive and difficult, it may not be possible for a centralized government to effectively regulate. Additionally, Ostrom recognized that markets are not a universal solution to common pool resource problems. Some common pool resources, like water and fisheries, are difficult to assign rights to. While it is possible to assign rights to particular kinds of use, the resource systems remain held in common.

Additionally, Ostrom recognized the fundamental issue of institutions meant to govern common pool resources is that their creation is subject to collective action problems as well. It is costly to create an institution, yet one does not need to be involved in its creation to benefit from its existence. Thus, while all collectively benefit from the existence of institutions that effectively govern common pool resources, there is little incentive for individuals to create them.

Ostrom argued that views like Hardin's put little faith in human capacity for self-organization, and she recognized that groups may be capable of solving the tragedy of the commons through collective self-governance. Under certain circumstances, individuals may be able to design institutions to govern their own use of common pool resources and use those resources in sustainable ways. Ostrom's goals were to figure out the characteristics of the sustainable self-governing institutions that help overcome collective action problems in the management of common pool resources, and to figure out under what conditions groups are able to overcome second-order collective action problems to create those institutions. In her 1990 book, *Governing the Commons*, Ostrom developed a series of design principles for sustainable institutions, including clearly defined boundaries, the presence of collective choice arrangements, graduated sanctions when rules are violated, and recognition of a right to self-organize by central governments, among a number of others. With regard to the development of the institutions themselves, she found that where resources were predictable and spatially limited, and appropriators had a common understanding of the resource and a sufficient level of trust within the community, institutions could be created. Ultimately, Ostrom argued that under certain circumstances, common ownership of resources need not end in tyranny or centralized coercive regulation. Rather, individuals are sometimes capable of creating institutions to govern themselves. The solution to externalities can involve self-governance.

## Environmentalism as a Social Movement

Crucial to the development of institutions governing the negative externality of pollution

was the development of environmentalism as a social movement. Something resembling what we today would call environmentalism sprung into existence around the middle of the nineteenth century, with individuals like Henry David Thoreau and George Perkins March discussing the natural world in their writings. The turn of the twentieth century saw the emergence of the conservation movement, with the founding of the Sierra Club in 1892 and the Audobon Society in 1905, and Teddy Roosevelt implementing conservation as national policy for the first time. As a part of the New Deal Policies passed during FDR's presidency, the Civilian Conservation Corp, the Fish and Wildlife Services, and the Tennessee Valley Authority were created. It was not until the 1960s, however, that environmental issues became a major concern for Americans nationwide. Rachel Carson's 1962 publication of *Silent Spring*, which brought to popular attention the negative effects of pesticides, specifically DDT, on the environment, is often credited with being a founding moment for the environmental movement in the United States. The 1965 documentary "Troubled Waters," produced by the US Senate Subcommittee on Public Works, and the Cuyahoga River catching on fire in 1969, only added to the growing demands by the citizens for action on pollution.

As the 1960s came to an end, and the 1970s began, the growth of the environmental movement was something that the United States government could no longer ignore. Congress responded to citizen demands for pollution controls with the passage of a series of major environmental laws: The National Environmental Policy Act (NEPA) in 1969, the Clean Air Act (CAA) in 1970, the Clean Water Act (CWA) in 1972, and the Safe Drinking Water Act (SDWA) in 1974, among others. The Environmental Protection Agency was created by an executive order in 1970 to implement these laws. Environmental issues associated with the negative externalities of pollution existed long before the 1960s. Indeed, the Cuyahoga River had caught fire many times before 1969. However, it was only once the public became engaged with environmental issues, once the social movement of environmentalism sprang into action, that meaningful political steps were taken to mitigate pollution.

Since public support for environmental action has been instrumental in spurring government action on pollution, scholars from numerous disciplines have paid a great deal of attention to how public opinion about the environment has changed over time and how individuals form their opinions about the environment.

One of the most consistent findings of the literature on environmental public opinion is the "White Male Effect." In many studies of public opinion, across numerous environmental issues, white men have been found to be far less concerned about the risks posed by environmental degradation and pollution than females and minorities. This finding also has been consistently found with respect to policy preferences. White men have been found to be far less willing to support policies that protect the environment from pollution, especially when it means potentially sacrificing economic development. Even more persistent than the effect of gender and race is the effect of political ideology and partisanship on environmental public opinion. Even in cross-national studies, it has consistently been found that individuals with left leaning political ideologies and party affiliations favor are far more likely to have concern about pollution, global warming, and other environmental issues, while right leaning individuals tend to be less concerned.

## Implementation of Environmental Law and Environmental Federalism

As mentioned, the growth of the environmental movement throughout the 1960s led to the passage of a number of environmental laws by the US government meant to deal with the problems of negative externalities caused by pollution. The implementation of these laws has been the subject of scholarly inquiry. Once laws and institutions have been established to help curtail the costs of negative externalities, how effectively those laws are implemented is a crucial issue.

In the United States, the EPA is the bureaucratic agency responsible for the implementation of most of the major pieces of environmental legislation passed during the 1960s and 1970s. While the classic idea of bureaucracy is that laws passed during political processes are implemented free of politics by a bureaucratic agency filled with technocrats and professionals unaffected by electoral and political pressures, the literature has found that this is not always the case. The implementation of environmental policy by EPA has often been found to be subject to the political desires of elected officials. Through the use of appointments, budgetary controls, and new laws, the president and congress exert political control of the EPA and other bureaucracies. The extent of this control is up for debate, but it is clear that the EPA is not a purely technocratic and independent bureaucracy.

The EPA, however, is not solely responsible for the implementation of environmental law. One major element of the implementation environmental of environmental law is federalism. Federalism describes a system in which sovereignty and governance is shared between a central government and geographic units within it. In the United States, federalism concerns the relationship between the government in Washington D.C. and the 50 states. Most of the major environmental laws governing pollution in the US fall under a cooperative federalism framework in which the EPA (at the federal level) shares responsibility for implementation with the state governments. The EPA sets standards at the national level, and the state governments are able to create plans to implement those standards and potentially create even more stringent pollution controls. In most cases, it is the state governments that are responsible for monitoring pollution and enforcing punishments when violations are discovered.

This cooperative federalism framework did not develop out of careful policy design, but was rather the result of political negotiations. The laws would not have been able to pass without robust state involvement. This has had major implications for policy implementation. Scholars have long recognized that because strict enforcement of the environmental laws could potentially have damaging effects on state economies, the cooperative federalism framework could lead to state governments shirking their responsibilities in a "race to the bottom." Because the pollution laws primarily target private firms, states that have greater enforcement of the laws would be less attractive than neighboring states, leading companies to target states that are less strict in enforcement. Indeed, this logic should seem quite familiar, as it is just another example of a collective action problem, except with states rather than individuals acting as parties. Each state acting in its own self-interest leads to a situation in which none of the states stringently enforce environmental laws and worse collective outcome for all. This idea of the "race to the bottom" also applies to the adoption of new policies at the state level covering environmental issues not regulated by federal law. Because it would risk economic development, states are unwilling to adopt policies that could damage businesses.

There is another side to this story, however. Rather than a "race to the bottom," states may actually participate in a "race to the top," where citizens are drawn to states that protect the environment and public health and avoid those that shirk their responsibilities. In this way, states may compete with their neighbors to limit pollution, rather than race to limit enforcement. This may also lead to states being sources of environmental policy innovation, seeking to get credit for moving past federal laws in protecting their environments. Indeed, it is the logic of the "race to the top" that leads to the idea of compensatory environmental federalism, where states create policies that address issues not covered by federal law. Neither "race to the bottom" nor "race to the top" fully captures the result of environmental federalism. What actually occurs is likely a mix, with some states competing to be leaders in the environmental field, while others compete to be as friendly to business as possible.

## Environmental Justice

Beginning around the 1980s, scholarly and public attention began to shift towards the distribution of

negative externalities from pollution. It became clear that pollution was not evenly distributed across the entire population, but rather focused in areas with poor and minority populations. This discovery led to scholarly investigation and activist involvement in Environmental Justice. Environmental Justice, or perhaps more accurately Environmental Injustice, focuses on how environmental risk is inequitably distributed across the population and how groups can overcome these issues.

The first empirical analysis to systematically address the unequal distribution of environmental risk was a 1987 study by the United Church of Christ's commission on Racial Justice, which found that toxic waste sites were often located near poor and minority communities. Other early studies emphasized the placement of Treatment, Storage, and Disposal Facilities (TSDFs), supporting the original analysis in finding that they were disproportionately located near poor and minority communities. While much of the environmental justice literature considers siting decisions of this kind, a more recent focus of the literature is on the potentially inequitable implementation of the major pieces of environmental legislation. Some studies have found evidence that courts and state environmental agencies are less stringent in their enforcement of environmental regulations, and that government and firm compliance with the laws is less in poor and minority communities as well.

One of the enduring questions in the literature on environmental justice is whether environmental risk is distributed across racial/ethnic lines, or whether it is distributed across socioeconomic status. Some have argued that environmental inequities are really a case of environmental racism and that they are the result of intentional or unintentional biases against minority populations. Others have argued that any perceived racial biases are simply the result of minority populations generally living in poorer communities. More recently, however, scholars have begun to question whether the distinction between race/ethnicity and socioeconomic status is a useful one. Instead, some scholars have argued that it may be more useful to explore them together, and perhaps interactively. In this way, socioeconomic status may actually moderate the effect of race on environmental outcomes. The recent problems with drinking water in Flint, Michigan, a poor and majority black community, only ensure that issues of environmental justice will continue to be discussed in both the scholarly and activist communities.

## Conclusion

As we move further into the twenty-first century, the importance of finding political solutions to externality problems will only continue to grow. Nothing illustrates this more than the growing challenge of climate change. Indeed, many consider the problem of climate change to be one of the greatest political challenges facing the world today. In many ways, the problem of climate change is reflective of the issue of negative externalities.

Climate change is fundamentally a problem of a common pool resource. All individuals and all nations share a common resource in the earth, and each country is incentivized to produce as much as possible in order to improve their economies. Through production, however, greenhouse gasses are produced that warm the globe and cause problems for all through rising sea levels, massive species extinctions, and higher levels of drought, among other problems. Because the costs of climate change are shared by all countries, no individual country benefits from reducing their emissions and potentially weakening their economies, leading to a situation in which the suboptimal outcome of climate change seems more likely. The ultimate political question of climate change is how to overcome the collective action problem wherein all countries are individually incentivized to continue emitting greenhouse gasses, but collectively would benefit if all reduced emissions.

As climate change illustrates, being able to understand how political institutions can solve the problem of negative externalities will only continue to grow in importance. In this way, the field of environmental politics will remain an important area of study for the foreseeable future.

## Synonyms

Political influence on evaluation; Program evaluation and politics; Public programs and politics of evaluation

## Introduction

Over the past 50 years, scholars have proposed various definitions of program evaluation, primarily from the standpoint of assessing the effects of social programs. Some definitions include the following:

- Evaluation determines the merit or worth of a program, policy, or entity (Scriven 1967).
- Evaluation determines what is needed in societal programs through the systematic collection and use of data (Mertens and Wilson 2012).
- Evaluation objectively examines the outcomes of programs to determine whether goals are met successfully or unsuccessfully (Weiss 1973).

Cumulatively, program evaluation involves the systematic study of social programs in the public sector. Rooted firmly in social science research methodology, program evaluation determines the merit or worth of program components or the effectiveness of program processes as they relate to program goals intended to address societal ills. Evaluation as a formal, practical discipline gained prominence in the 1960s with national programs related to the "Great Society" and the "War on Poverty" that were rigorously evaluated to determine the return on investment (Datta 2011). Early practices in evaluation emphasized the use of information in terms of the ability to influence a decision and the likelihood that decision-makers would act on evaluators' recommendations (Rossi et al. 2003). The evaluator's ability to influence decisions and promote action as a result of evaluation motivated early professional evaluators to focus on the primary goals of research methodology and empirical data collection.

While continuing to improve evaluation from a methodological perspective, attention in the field shifted in the 1970s to include not only the uses of evaluation findings but also the politics of the evaluation process. The politics of evaluation refers to the interactions of stakeholders involved in approving, funding, and implementing public programs that have different positions of power, influence, and authority in relation to a specific program (Palumbo 1987). As social programming increased the involvement of policymakers, administrators, program managers, clientele, and other stakeholders, evaluators experienced political pressures from special interest groups within the political process who had a stake in program resources (Datta 2011). Stakeholder involvement therefore contributes to the political context of evaluating public programs.

## Political Context of Evaluation in the Public Sector

Whether programs are carried out by public agencies or nonprofits, they often originate from political processes and decisions within the context of public policymaking (Mohan and Sullivan 2006).

From policy approval to program implementation, and then assessment of policy or program components, evaluation is relied upon throughout the policymaking process. In 1973, Carol Weiss wrote *Where Politics and Research Meet* (Weiss 1973) arguing for the importance of understanding the high-stakes environment that programs operate in. Weiss was one of the first professional evaluators to underscore the significance of being aware of stakeholder interests in evaluations (Azzam and Levine 2015; Datta 2011). Within a democracy evaluation serves to not only provide governmental oversight and accountability in relation to policymaking (Chouinard 2013) but also to help determine program decisions, advance knowledge in society, and inform the public more broadly (Chelimsky 2006).

It is through the use of different approaches to evaluation that results are used by stakeholders to inform, defend, support, or counter a proposed course of action (Mohan and Sullivan 2006). Since Weiss (1973) first wrote about politics in evaluation, others have echoed her thoughts (Chelimksy 1987; Cronbach et al. 1980; Palumbo 1987) in selecting which programs undergo evaluation, who will be asked to conduct the evaluation, which stakeholders will participate in the evaluation process, and how evaluation results are used. The politics of evaluation often begins with the choice to select certain programs over others to undergo evaluation.

## Selection of Programs to be Evaluated

Before programs are assessed, there are choices made as to which programs or specific parts of a program will undergo an evaluation. These choices typically fall to agency heads, program staff, funders, elected officials and their staff, or some combination of stakeholders referred to as the "evaluation sponsor." As a result of stakeholder involvement, programs may be selected for evaluation based on different criteria (Mohan and Sullivan 2006). These include understanding the impact of a program on clients, determining if program goals were met, or assessing whether the program fits the needs of the population being served. Nevertheless, evaluations can be commissioned for a myriad of other reasons beyond understanding the program outcomes. Considering the politics that may arise out of public and sometimes controversial programming, specific evaluations may be commissioned over others based on the likelihood of having positive/beneficial results, the timeframe in which evaluation results are needed, and whether or not programs may benefit from increased attention or resources that may occur as a result of the evaluation process (Mertens and Wilson 2012).

Weiss (1973) called attention to the demands for evaluators to deal with competing interests and loosely defined goals by using political tact to decide on what to evaluate (Chouinard and Cousins 2015). Political tact refers to an evaluator's efforts to determine why a program or agency is seeking an evaluation, identifying the goals for undertaking an evaluation, and determining how the information will be subsequently used (Patton 2008). Understanding the reasons why a program is chosen for evaluation is helpful for determining other influences on the evaluation process. These may include the need to impress funders with credible information on the program, to provide evidence justifying an already determined course of action in the policy process, or even to delay a decision in the face of criticism (Rossi et al. 2003). While the choice of programs to be evaluated may be driven by any number of justifications put forth by the evaluation sponsor(s), several competing interests may equally influence the choice of who will conduct the evaluation.

## Selection of Evaluators

Evaluation professionals or teams of professionals can be found within or outside an organization or agency that is sponsoring the evaluation. A primary distinction in selecting an evaluator is the perceived and actual difference between an internal and external evaluator (Mertens and Wilson 2012). The individual(s) assigned or hired to conduct an evaluation can influence the credibility of the evaluation process and results depending on their relationship to the program

(Mohan and Sullivan 2006). For example, an internal evaluator works for the organization or agency that houses the program being evaluated and may have some stake in the outcome of the evaluation. On the other hand, an external evaluator conducts the evaluation, but not as an employee of the organization or agency where the program resides. When seeking an external evaluator, the organization, agency, or program manager may weigh the benefits of gaining an outside perspective given the costs in time and resources associated with understanding the internal dynamics of a program. While an external evaluator is often relied upon to be objective and independent in the evaluation process and therefore less likely to influence the evaluation results in favor of a certain outcome, they may be at a disadvantage in not knowing the inner workings of the program or agency. Internal evaluators may overcome the perceptions of potential bias in their work by designing a more rigorous, valid, and detailed evaluation plan that is closely followed and well documented (Rossi et al. 2003).

The qualifications necessary to be an evaluator require expertise in the areas of program content, knowledge of evaluation examples from other programs, and appropriate research norms and methods for the program context (Chouinard and Cousins 2015; Datta 2011; Vanlandingham 2010). Evaluation of public programs often occurs in targeted problem areas like education, crime, health care, or substance use. As a result, evaluators may be asked to conduct long and complex evaluations in terms of program substance and length, or they may be asked to conduct more limited evaluations of a single program requiring less complex research methodologies or time (Rossi et al. 2003). The field of evaluation relies on the *Guiding Principles for Evaluators* published by the American Evaluation Association to inform evaluation practices and ethics within the field. The principles acknowledge essential practices of evaluation that include involving stakeholders, maintaining independence, identifying conflicts of interest, protecting confidential and sensitive information, ensuring quality, presenting balanced results, and preserving evidence of accepted evaluation methods. After an evaluator is selected, the evaluation design is considered in light of the best approach for the subject matter, the extent to which stakeholders are expected to be involved, and possible future uses of evaluation results.

## Evaluation Approach and Stakeholder Engagement

Program evaluation takes place within a broader context of policymaking. With a growing interest in determining the impact of public programs, evaluators acknowledge that satisfying stakeholder needs and ensuring legislative use are both high priorities (Azzam and Levine 2015; Vanlandingham 2010). In the past, an emphasis on the methods used in evaluation studies took priority over the involvement of clients or other stakeholders. A methodological orientation allowed evaluators to focus on quantitative research design over other priorities in determining a specific approach to evaluation. However, as studies on evaluation utilization arrived at the conclusion that the impact that evaluation has on legislative decision-making is minimal, some studies have correlated stakeholder engagement with increased evaluation use (Vanlandingham 2010). As a result, evaluation of public programs shifted attention to democratic values to ensure that stakeholder voices are heard and evaluation reports are ultimately used to inform public programs (Chouinard and Cousins 2015; Datta 2011). The history of evaluation research reflects that interactions with local partners have become increasingly important for understanding the complexities and uncertainties involved with collecting data for evidence to build a case for recommendations (Chouinard 2013; Datta 2011).

Originating from the theoretical frameworks that came about during the 1970s, responsive evaluation became a chosen method for evaluators interested in a more participatory approach (Chouinard 2013). By empowering managers, clients, and others to gain knowledge through participation, responsive evaluation extended the scope of evaluation to focus on understanding

shortcomings of the program in terms of responsiveness to stakeholders. Using this framework, evaluator's factor in as many stakeholder interests as possible in an effort to evolve from the previous methods that only included the motivations of policymakers or decision-makers (Vanlandingham 2010). A participatory approach allows for understanding of how the program or policy impacts the individuals that have contact with the program components. This approach also supports a more democratic perspective on evaluation, as individuals beyond program administrators are able to engage with the evaluation process from beginning to end.

Participatory evaluation became more popular in the 1980s and involved the coordination of trained evaluators and community partners to increase knowledge about program decision-making (Chouinard and Cousins 2015). Emphasizing partnerships between evaluators and stakeholders, participatory evaluation seeks to not only serve as an approach for reporting but also to address power imbalances that exist in society (Chouinard and Cousins 2015). By opening up communication channels between evaluators and stakeholders, information can be gleaned about pressing needs and methods that deliver timely results, all within an atmosphere of organizational learning (Chouinard 2013).

Participatory approaches have made way for empowerment and social justice approaches to evaluation, which also focus on stakeholder involvement (Mertens and Wilson 2012). An evaluation design with a social justice perspective tends to focus on viewpoints and participation from marginalized groups, while empowerment evaluations allow often unheard voices and perspectives to be included in the evaluation process and results. Through these approaches, evaluators often rely on mixed methodology including both quantitative and qualitative data to inform and expand the uses of evaluation results. The decision to use different approaches beyond a purely methodological approach may be influenced by various stakeholders and with some consideration for the time it will take to complete the evaluation and how evaluation results will be used.

## Uses of Evaluation Reports and Research

While evaluation projects may be judged by their outcomes, it is more common that evaluation results are judged by their utility or how useful they are to decision-makers and stakeholders (Rossi et al. 2003). Organization and agency stakeholders use evaluation information in different ways. When evaluation results, reports, or data are used directly by stakeholders, they then provide information for supporting decisions related to a specific course of action or policy. This is considered to be the highest form of utility in evaluation research. However, there is a tendency to use positive evaluation results to support program initiatives, while negative evaluation results are disregarded (Palumbo 1987). Where evaluation results are used to inform thinking on specific subjects or contexts, information is shared in a way that supports a certain perspective or preconceived understanding of a problem. This may also include the use of evaluation results to sensitize society to the frequency, prevalence, or specific dimensions of a social problem (Rossi et al. 2003). Given that evaluation results can identify certain nuances to a problem or issue, within the context of politics and elected officials, results may also be used to persuade others to defend or challenge the status quo of different social programs. Even when reports may be read or accessed by only a few elected officials, depending on the subject matter, considerable media attention may be given to a report. This will extend the impact of the evaluation results to beyond the specifics of the program or policy (Rossi et al. 2003).

Utilization of evaluation results may also be influenced by the credibility of the evaluator and evaluation methods documented in a report. For example, external evaluators with strong social science research backgrounds may be perceived as objective, qualified, and credible. Therefore, the reports they produce may gain greater support and validation from others. Likewise, where sound research methods are relied upon, evaluation reports may be referred to and even replicated in other studies of similar contexts. Evaluation reports are therefore judged not only

by their content and substance but also by the source of the research.

## Conclusion

As public programs originate from the policy process, any assessment or evaluation of their outcomes, processes, impacts, successes, or failures will have an inherently political component involving various stakeholders. As professional evaluators continue to develop their skills and approaches to evaluation in an effort to meet the public demand for information in a democracy, so, too, will the need to consider the influence of politics on evaluation design, implementation, and reporting. A strong balance between methodological rigor and practical use will still need to be foremost when conducting evaluations of public programs.

# Politics of Corruption in Africa

John Sunday Ojo
School of Public and International Affairs, Virginia International University, Virginia, USA

## Synonyms

African politics; Colonialism; Democracy; Political corruption; Postcolonial state

## Definition of Terms

| | |
|---|---|
| Politics of stomach infrastructure | A political logic popularized in Africa that considered distribution of money and material stuffs as an alternative approach to woo the electorates in order to garner their political conscience during election. |
| African democracy | This is a democratic paradigm modeled as hybrid or semiauthoritarian regime. |
| Political corruption | This is misuse and abuse of political office for personal aggrandizement or benefit. It also dwells within the context of either elected representative or political appointees involving in |

P

the manipulation of the rules and regulation or state laws for personal benefit.

## Introduction: An Expedition Toward Contemporary Politics in Africa

The contemporary political nomenclature in Africa cannot be well understood without the instrumentality of precolonial political structure and the mechanical application of modern political arrangement devised by the colonial authorities. Africa's historical formation has its own unique sociocultural, political, and traditional representation. The African traditional political system was based on communal panache with an element of collective participation in local affairs. The spirit of oneness has made the traditional political system more unique in the world. Accountability was sacrosanct, even than Western societies; the chiefs handled both communal functioning and even any natural catastrophe that occurs. The chiefs may be asked to go to exile or commit suicide if he violates the fundamental ethos of social order (Ake 1991). It is in line with Ake's argument that Salih (2001) recognizes the democratic structure of African indigenous institution, he argues that democracy was embedded in African precolonial administration; however, the colonial and postcolonial political systems have commandeered the exclusion of citizens from democratic governance. Therefore, modernization theory applied toward African political renaissance is considered to have trampled on indigenous political institution and gives no room for citizen's participation in governmental affairs. As a result of this exclusion, African states are subjected to poverty, weak institution, and global pressure to adopt western democratic lifestyle, endangering independence and post-independence developmental efforts (Ake 1993). It can therefore be argued that the precolonial Africa was governed on traditional model, with basic principles, adhered with, by both the indigenous community and their traditional chiefs.

In the context of colonialism, African traditional chiefs were mobilized to support colonial sociopolitical structure; incentives were offered to fascinate indigenous chiefs for the exploitation of economic resources. The policy of divide and rule were instrumentalized to appease local populace, the superior ethnic groups were orchestrated to subdue ethnic minority groups, people were mobilized against one another, hence, form the origin of ethnic majority-minority crisis in Africa. In the pursuit of promoting colonial economic agenda, monetary reward were offered to African chiefs to pacify the uprising of freedom fighters as it was revealed in the case of Mau-Mau in Kenya. Colonialists employed corruption tool to woo African chiefs in support of their economic plan and political domination (Mulinge and Lesetedi 1998), considered as the origin of corruption dilemma in Africa. One of the advocates of this view, Patrice Lumumba contends that corruption syndrome "is an import, nurtured, developed and entrenched in the continent of Africa" (Lumumba 2011, p. 5). A further philosophical sensitivity of this school of thought includes the one acknowledged by Ebbe (2005), he argued that:

> The seed of political corruption was sown in African countries during the European Scramble for Africa and the subsequent colonization of the various people of Africa. In the process, many ethnic groups (tribes), without ties of consanguinity or religious affinity, were amalgamated into one country. Some of these countries may have as many as 250 ethnic groups. It was, and still is, an uncomfortable marriage or union. Some of the amalgamations were achieved by corrupting some tribal leaders to concede to the amalgamation at the opposition of a related tribe, sending to exile the leader of the opposing tribe, and making the conceding tribal leader the sole administrator of both tribes. The colonial administrators bribed the conceding tribal leader to concede to the colonial hegemony. Gifts of European manufactured goods to the tribal leaders were the quid pro quo. Political corruption therefore imported into Africa South of Sahara' (p, 101).

The ethnic divides echoed by colonialists, therefore, leads to what Ekeh (1976) popularized as "two publics" that characterized the current African sociopolitical disorder and served as the origin of corruption in the region. This view manifests in everyday life in Africa till date. This could be found in economic, political, and social arrangement. However, before the departure of colonial officers, struggles were made against the colonialists in several African states, people

were mobilized to agitate for independence, and some of freedom fighters have had western education, either home or abroad. The unrelenting agitation, thus, led to declaration of independent in some African states. Prior independence, African political elites were recruited from freedom fighters; they were charged to take control of economic resources for the general welfare of the citizens. They were saddled with the responsibility of designing people-oriented policy that alleviate endemic poverty, incorporates diverse ethnic configuration, and provide an inclusive democratic political platform for the citizens (Mbaku 2009). Very few of those that championed African independence had professional livelihood; on this basis, many of them were appointed to coordinate African political affairs. This opportunity was perceived as a reward for the independence struggle. The institution was therefore devised by the political leaders to foster ethnic, religious, and regional sentiment, consequently, becomes a backdrop for corruption and hegemonic politics in African political landscape (Gumede 2012). The integration of African elites into public affairs during the departure of colonialism led to economic, social and political supremacy of the political class that repels Africa's postcolonial states. Their interest can, therefore, be evoked as an exemplification of postindependence regimes (Branch and Cheeseman 2006). It is against this background that Osaghae (2005) explained it all that,

> the state in Africa was created and integrated into the global capitalist system as a peripheral formation by colonial authorities, principally to serve the needs and interests of global capitalism, and it has done so since then. In this scheme, the interests of the Africans themselves were, and remain, submerged. This is the major reason for the disjuncture between the state and society, which has kept the state derooted and alien (some say irrelevant) to most ordinary peoples. It is in the context of the de-rooted state that notions and structures of the common good, nationhood, citizenship, public morality, legitimacy, accountability and transparency have malformed, been lacking or fiercely contested.

In the postindependence regime, Africa has developed its nonconformist breed of democracy. "African-style democracy is often the most minimalist, most limited and most elementary kind of democracy. In African-style democracy the state is the major tool for accumulating wealth. That is also why there is a proliferation of political parties in African democracies – everyone wants to have access to the state so they can become wealthy" (Gumede 2015). Moreover, African nations adopted democracy without institutional foundation for democratic values. The absence of democratic institution to facilitate democratic process serves as a major challenge to African democracy. African election is attributed to vote-buying, election rigging, electoral violence, and all sorts of electoral criminalities that subject democracy to a game for the highest bidder at the advantage of political capitalists. The institutional failure and hybrid democratic foundation create ominous platform for backward democratization or incomplete democracy in the region (EISA Conference 2007; Rose and Shin 2001). It is believed that the dearth of genuine democratization impairs the realization and survival of sustainable development in African postcolonial state (Alence 2009).

In the 1990s, democracy returns to African nations, this nurtures aspiration for good governance; its acceptance in the 1990s constitutes rearrangement among a range of stakeholders; including political elites, civil societies, and international communities; hitherto, very few of the African states are considered operating liberal democratic system. The contemporary democratic movement in the continent is measured as a strategy to retain international legitimacy to fascinate foreign aid and foster corruption (Obianyo 2008; Thompson 2010; Hanlon 2004). Hence, it is difficult to christen African democratic model and therefore raises confusion to the scholars of politics (Ake 1993). The ascendancy of corruption in African politics is considered as a major obstacle that responsible for Africa's tribulation; such assumption generalizes the nature of African states (Szeftel 2000). Ake (1993) therefore concludes that corruption is perceived as a device through which "big men" provides a political template for clientelism and patronage to loot state resources espoused to compensate political allies. Thus, this entry explores the linkage

between African contemporary democracy and political corruption, considering paradigms from Democratic Republic of Congo, Kenya, South Africa, Tanzania, and Nigeria.

## The Current Debates on Political Corruption

Corruption as a concept is surrounded by scores of ideological complexities, defining it becomes a laborious intellectual task, especially, to situate it within the divergence political climate. Despite all these complexities, corruption is considered as misuse or abuse of power, funds or political/administrative positions for private gain. This intends to explain accumulation or diversion of public wealth for private advantages. However, in the political context, it entails diversion or misuse of public funds for personal aggrandizement. Merely considered the political sophistication of corruption, misuse of political power by the government in power, or its agency can be situate within the concept of political corruption.

In a similar direction, Heidenheimer et al. (1993, p. 6) opines that political corruption "is any transaction between private and public sector actors through which collective goods are illegitimately converted into private-regarding payoffs". This definition establishes the involvement of the government and its agency. However, understanding political corruption within the state can be difficult without ironing out bureaucratic corruption. This is because, the state cannot function without the bureaucrats whose obligations are to facilitate the decision making of the political class, including enforcing law and order in the state. Although, some policy makers and scholars usually construct political corruption alongside bureaucratic corruption, Amundsen (1999) shed more light in understanding this dichotomy between the two conceptual arguments. He argues that bureaucratic corruption occurs at the implementation stage of the policy made by the political office holders. In this context, political corruption can be explained in terms of involvement of elected or appointed representatives in diverting public funds for private utilization. In this environment, the political class uses their offices to influence and siphon state funds aided by their political status while bureaucratic corruption operates within the public administration milieu and therefore disengage politics from administration.

Political corruption also views as misallocation of resources, manipulation of government procedures, rules and regulations by reconfiguring the ethical standard of the state by the political office holders. Lodge (1998) argues that it is a situation whereby the state laws are circumvent and fashion in line with the individual political elites, when laws are abused, misused, or disregarded by those in power to protect their personal interest. Beyond that, political corruption also constitutes electoral fraud and electoral manipulation at the advantage of the either incumbent regime or the political colossus whose political influence can be felt in the polity. This may also be established in the context of exchanging money or material benefits for electoral support. This is more pronounced in the contemporary African democracy which was popularized in Nigeria as "politics of stomach infrastructure."

## The Nexus Between African Democracies and Corruption: Examples from South Africa, Tanzania, Kenya, Democratic Republic of Congo, and Nigeria

Most African states have followed the political steps of former colonizers in the post-independence regimes. They employed the political model operating in the western colonial states. Experience from Ghana, Kenya, Uganda, Nigeria, Kenya attempted parliamentary model applicable in the Britain prior independence while French colonies followed comparable fashion (Ozor 2009). However, despite the adoption of western political style, most African states are still categorized as hybrid regime – a pseudodemocratic states or semiauthoritarian (Cranenburgh, 2011).

A manifestation of the dynamics of institutional corruption and spoil politics in African democracies is found in a study conducted by

Transparency International, it found that 44% of parents have paid unlawful fees for free education in Uganda, Sierra Leone, Ghana, Madagascar, Niger, and Senegal (Transparency International 2009). In Zimbabwe, local councilors have liaised with housing officials to buy government houses and sell them at inflated rates for the citizens (Transparency International 2015). In Kenya, the political regime of Mwai Kibaki was alleged of inflation of contracts by the anticorruption agency led by John Githongo. In Liberia, the government that ruled up till 2005 was alleged of stolen more than $100 million annually (Ellis 2006). The culture of primitive accumulation by the public officers saddled with the responsibility of safeguarding public treasury has portrayed African postcolonial state (Appolloni and Nshombo 2013). Hence, leading to conflicts, civil war, terrorism, political instability, poverty, and exasperating developmental cynicism (World Bank 1997).

## Democratic Republic of Congo

In Democratic Republic of Congo (formerly Zaire), started from the political regime of Mobutu Seseko, the primacy of corruption is institutionalized in the political and bureaucratic framework. Corruption forms a coordinating network through military personnel, civil servants, and political office holders. Also, corruption was also accredited in the judicial system, a situation whereby adjudication is based on the level of wealth or affluence, political, and social status. The judicial verdicts are not instituted on the evidence presents in the court of law. Furthermore, judicial institution is also being used by judicial officers to chastise their enemies. The custom that is saddled with the responsibility of safeguarding counterfeit goods also serves as facilitators of smuggling operations. Corruption also manifests among directors of public institutions and proliferation of "ghost workers." Almost every public sector is involved in corrupt practices (Mbaku 2010).

In Democratic Republic of Congo (DRC), corruption saturates all levels of government, constituting involvement of both senior and junior civil servants. This is evident in a study carried out by Global Corruption Barometer; it is believed that 62% of the citizens interviewed have paid bribe to government officials within that year. The payment of bribe involves some of the key government parastatals and functionaries, including judiciary, police, tax, permit, education, revenue, and registry. In securing government contract, private companies have to pay bribe before the contract could be approved. In the 2010 World Bank Enterprise Survey, 65% of the companies interviewed have agreed that they have paid bribe to the government officials in order to secure contracts while 75% of them agreed that they need to present informal gifts amounted to 9% of the secured contract to the civil servants who are in charge of the contracts. Corruption also forms the primacy of electoral conduct in the country. The 2011 election in the country reveals various form of electoral corruption such as election manipulation, rigging, campaign financing, and voters' registration. The parliaments, police, judiciary, public officials, the military, and educational institutions are considered as most corrupt in the country (Transparency International 2013). The reason for endemic corruption among the Congolese public servants is attributed to poor salary. Before any service could be rendered to the public, the citizens need to facilitate it by providing bribe. For instance, in 2005, public officials from various ministries including the ministry of mines, foreign trade, communication, and transportation were indicted due to corruption (Harsch 1993).The obscurity of corruption has therefore continued to eclipse daily governmental business in Democratic Republic of Congo.

## Tanzania

In Tanzania, the colonial occupation in the region has a great impact on the general composition of the political system. The origin of corruption in the country is attributed to the unaccountable colonial administration that control political machinery in Tanzania. Colonial government institution was accountable to imperial state and

its allies while profits are transported to overseas. The state was cohesive to serve the interest of colonial rule; while the interest of the people was subjugated. This legacy was therefore inherited by Tanzania and other East African nations in the postcolonial regime. The debris of colonial institution has, therefore, typifies the structural framework of corruption in the country (Sedigh and Muganda 1999). The level of corruption has increased over time in the country, from independence in the 1960s. The endemic corruption has its place in bureaucratic organizations. The hierarchical composition of Tanzania's public organization provides a responsive dais for intensive corruption in the country. The citizens that want specific services have to abide by the procedural framework of the government, and thereby becomes challenging to the people who might want quick service delivery. Thus, provides an opportunity for public officials to ask for illegal fees for the speedy provision of public services (Masabo 2014).

As at 1990s, the Tanzania's presidential report on corruption found endemic corruption that constitutes illegal payment, unlawful award of contract, and illegal procurement channeling through the government institution (Gray 2015). In the twenty-first century, corruption continues to manifest within the Tanzania's political terrain; it revolves around the top political officials, top ranking government personnel, local industrialists, and multinational corporations involving a series of unlawful activities such as kickbacks, looting of public treasury, bribes, among others. The case of Richmond and Independent Power Tanzania Limited (IPTL) illustrate how grand corruption entwines with the ruling party and international business organization that has becomes a very foundation of Tanzania's political life. In 2005, an advertisement was publicized by Tanzania Electric Supply Company Limited (TANESCO). All the applications submitted for the project were rejected as a result of lack of financial capacity and competence; among the company rejected was Richmond Development Company. However, the political support for the Richmond Development Company was later championed by the then Minister for Energy, Mr Msahaba, the Prime Minister, Edward Lowassa, and the new Minister for Energy, Mr Nazir Karamagi. The Minister for Energy therefore instructed all his subordinates to approve all the necessary documents regarding the contract to Richmond Development Company. In the aftermath of the contract approval, the company was found incapacitated to actualize the electricity project. This led to intervention of parliamentary enquiry into the mode of awarding the contract. The panel found that the approval of the contract negates legal and procedural laws in awarding contracts.

In another related case, in October 2014, the ruling party Chama Cha Mapinduzi (CCM) was ensnared in the corruption scandal that entails illegal energy contract that worth US$112 million. Consequently, led to the suspension of foreign aid by the twelve international donors and the resignation of some political juggernauts from the parliamentary chamber (ibid); therefore, "corruption is then shown to be socially embedded in logics of negotiation, gift-giving, solidarity, predatory authority and redistributive accumulation" (Sardan 1999, p. 25). In this context, corruption has been domesticated in the public institutions that have reproached the country's international political image.

## Nigeria

After many political upheavals of authoritarian regimes, democracy returns to Nigeria in 1999, which symbolizes another historic political landmark in the country. However, the phenomenon of corruption has remained the Nigeria's biggest challenge; the everyday corruption has heaved the nation back to recession, underdevelopment, and astronomical increase in unemployment. Concurrently, the country is plagued amidst ethnic configuration, bad political leadership, terrorism, sociocultural hindrances, and big-man politics and therefore led to democratic hybridity and rocky democratic experience. Nigerian political structure is personalized to the extent that it is difficult for ordinary citizens to have access to basic necessities of life. According to Seteolu

(2005), "these socially imbibed values are replicated in the political terrain where contending coalitions accumulate resources to offset side payments required to retain or expand followership in the context of power politics. The fierce struggle in the public space is linked to conflicts that characterize leadership succession in traditional political systems and the attractions of political control where party politics guarantee access to wealth and economic power"

Money politics also takes another dimension in the country, in terms of obtaining party nomination form; the contender must have acquired millions of naira, thus, disenfranchising those with genuine interest of the country. Money has been a veritable tool in the hands of politicians to manipulate and influence election results. While the citizens have bowed to the mammoth threat, especially, the youths who are unemployed or victims of poverty, consequently, instituting political hegemony (Muse and Narsiah 2014); Therefore, money politics serves as a determinant for political participation and representation, youth and women in this process become the victims who have no access to economic resources (Adetula 2008). Due to prevalence of poverty, the citizens are found succumbing to the whim and caprices of the political elites who have the power to influence electorates by distributing money and material needs, thus empowering political representatives to be unaccountable and fostering corruption in Nigeria's political space (Tar and Shettima 2010).

Electoral contestation becomes expensive due to vote-buying at all levels of government. In a study, it was revealed that there was astronomical increase in political expenditure in 2003 elections. The study emphasized the possibility for political godfathers who are responsible for financing election to request repayment in monetary values or by influencing government policies. Money is therefore at epicenter of Nigeria's democratic politics (Bryan and Baer 2005). Elections are won based on financial muscle; the practice becomes traditional way for electoral contestation at local, state, and national levels. Thus, money remains an apparatus to determine the outcomes of elections in Nigeria's political terrain (Adebayo 2011). If the citizens can be swayed to compromise their electoral right, therefore, it is difficult to categorize Nigeria's democratic model as ideal one (Bratton 2008).

There are numerous factors that can be adduced to Nigeria's money politics. These factors include poverty, ignorance, altitudinal problem, and political apathy. Due to high level of poverty, some electorates consider election period as an avenue to get their democratic dividends from deceitful politicians. They sell their votes and get their "national cake." Also, the inability of political contestants to articulate comprehensive manifestoes provides another alternative for adoption of money politics in Nigeria. Moreover, political skepticism on the part of electorates who have perception that politicians are full of self-seeking, corruption, and that the whole political processes are fraud due to past political experiences, therefore, payoff is considered as another political logic to get their share (Agbaje and Adejumobi 2006).

The recent discovery of subterranean arms procurement funds [$2.1.billion] looted by the former National Security Advisor, Col Sambo Dansuki (rtd) during President Goodluck Jonathan's regime, discovered by the anticorruption institution [EFCC] led by the incumbent administration of President Muhammadu Buhari exemplifies how democracy is instrumentalized to facilitate corruption in the country. Additionally, election rigging, kickback, inflation of contracts, bribery, ghost workers syndrome, and embezzlement become a political way of life for public office holders in Nigeria (Dike 2008). Corruption also revolves around electoral cycle in Nigeria. The 2007 election has been assessed both locally and internationally. The election was rated as the worst in the history of electoral administration in Nigeria. It was symbolized and sheathed with electoral corruption. Electoral corruption in Nigeria's 2007 election involves stuffing of ballot boxes, manipulation of election results, among others (Omotola 2010, p. 549). Under the regime of former President Goodluck Jonathan, corruption has been widely reported among political paraphernalia. The public declaration by the former Governor of Central Bank, Lamido

Sanusi, that Nigerian National Petroleum Corporation (NNPC) could not account for $20 billion from the sale of crude oil also symbolized how corrupt Nigerian public institutions are (Ross 2014). The Nigerian National Petroleum Corporation (NNPC) has been considered as the hub and propeller of corruption in Nigeria and this validates the theory of "resource curse" which makes the country a "rentier state" (Obi 2010). In the sector (NNPC), contracts are awarded based on political affiliation, while all Nigerians refineries have malfunctioned, the reason for the total neglect of the refineries is to allow political partners to benefit from the stealing of refined oil importation (Premium Times September 16, 2015).

## South Africa

In South Africa, Lodge (1998) argues that corruption in the country has its origin in homeland department. The nature of corruption in South Africa is unique to other African states where corruption has pervaded every political space. However, corruption is evident in various dimensions in the country. Based on empirical clarification, corruption is embedded in the country's administrative machinery. For instance, the case of financial director at the Ntsika Enterprise Promotion Agency, a government owned institution established to facilitate small-scale businesses serves as an example. Shine-On Hadebe was sacked in 1996 as a result of misappropriation of R70,000; Mkhwanazi, who was appointed to replace the sacked manager, he was also alleged of embezzling R211,000. The Independent Broadcasting Corporation managers were alleged of corruption that forced some of them to resign. Even academic institutions are not exempted from the malignant corruption in South Africa. In the University of Venda, a senior official was caught in the corrupt act in the attempt to cash a check in the name of the University without the knowledge of appropriate authority in the institution. It also surfaces by exchanging money for marks in South African universities, as it was evident in 1996.

Another form of corruption engulfs the leadership of President, Jacob Zuma. Zuma was alleged of advocating for a bribe from the head of South African branch of Arms Company which was under investigation. It is believed that the bribe aimed to guarantee the political support of the vice president so the company would not be prosecuted (Amundsen 2006). In a corruption related development, President Jacob Zuma was also implicated in a 355 page report titled "State of Capture," the report contains allegations, and in some instances evidence, of cronyism, questionable business deals, and ministerial appointments, and other possible large-scale corruption at the very top of government (CNN November 2, 2016). The allegation against the President led to massive protest against his regime by the civil society organizations in South Africa. Started from the transition of power from Nelson Mandela regime, corruption has been the national debates in South Africa, from one regime to the other; the syndrome of political corruption has continued to subdue the political leadership and international integrity of the country.

## Kenya

In the early year of independence in 1963, Kenya had already nurtured wealthy capitalists; it is on this pedestal that affluence is measured as a precondition for political triumph. Those who were lucky enough to get to the mantle of political leadership automatically became the member of affluence group or vice versa. The sustainability of the wealthy aristocratic cabal was based on manipulation of contract procedures in which the political class influenced or awarded contracts to themselves. The 1998 saga in which some forces within the state operative circumvented contract procedures exemplifies the porosity of Kenya's state institution, serving as a devise to sustain corruption in the country (Mutounyi, 2005). In Kenya, Corruption is notable among government parastatals. The model of Kenya's corruption is so exceptional that it forms coordinating network amongst public institutions. "Kenya is one country where is a complicated syndicate of corrupt

officials between the police, the public and the judiciary, that you cannot easily extricate one from the other. It has been observed that investigating such corruption cases could be very difficult because, if legal authorities (prosecutors or judges) do not support anti-corruption probes, ways can be found to obstruct such investigations" (Anassi 2004, p. 24–43).

According to Akech (2011), he argues that corruption is institutionalized among the executive, legislature, and judiciary in Kenya; it is believed that none of these apparatus of government are excluded from the network of corruption the country. According to him, the corruption scandal that involves importation of oil and maize and the looting of free primary education fund demonstrates how grand corruption has eaten the institutional foundation of the Kenya's government. Unfortunately, the judiciary that would have safeguarded the public treasury has been merged with the autochthonous network of the looters in the country. In a similar experience, the case Goldenberg International in 1990s which necessitates conspiracy among the government authorities, including the Ministers, senior civil servants, and wheeler-dealers to loot public funds in the course of embarking on government projects demonstrates interconnectedness, networking, and alliance formation within the government aristocratic cabal in Kenya.

The dubious intersection among the judicial officers, police, and citizens give this type of corruption a remarkable outlook. It was observed that police do form alliance with judicial officers to execute corrupt deals. Corruption among police officers manifests in "bribery and extortion, favoritism, kickbacks, misapplication of resources, deceptive practices, theft, and premeditated criminal activity." While the ministry of public works is considered as second most corrupt institution in the country. The ministry handles construction and maintenance of roads, residential apartments, and public offices in the country. Corruption is so endemic in the ministry to the extent that every contract has to be inflated through alliance formation between public officials and contractors. Also, the citizens have to pay a bribe before public services could be offered (Anassi 2004, p. 24–43). In a similar direction, the former head of anticorruption agency in Kenya, John Githongo, the anticorruption Czar, exposed the various financial scandals that involve various political-colossi under the leadership of president Kibaki. It is believed that the pledged of John Githongo to expose all the politicians involved in the graft led to threatening of his life. This was eventually led to John Githongo exile in United Kingdom (Amundsen 2006). Hence, many public officials considered their position as what Bayert et al. (1999) terms as "meal ticket," a situation whereby public office is exploited as an opportunity to accumulate personal wealth. There are numerous factors that ensuing lingering corruption in the country. These include institutional problem, which legalize every activity of the government in power without questioning. The state secrecy laws empower the incumbent regime to conceal government information from the governed (Akech 2011).

## The Normalization of Politics of Stomach Infrastructure

The resurgence of politics of stomach infrastructure has been an antiquate one within Africa's political ecology. It dated back to independence which manifests during regional electioneering campaign in Nigeria. The theoretical platform of stomach infrastructure is situated in political clientelism, considering the effectiveness of material benefits for political support, making it difficult for electorates in a fragile region like Africa to safeguard their vote. The typical system of informal political relationship between voters and political contestants is refers to clientelism. For clientelism to become an effective political strategy in an electoral competition, the political parties must incorporate a vast number of local political agents saddled with responsibility to provide information about voter's political preferences so that they can provide material and monetary packages to local populace in order to get political advantage in electoral competition; linking political agents and the electorates (Schneider 2015). This has its origin in rural/kinship society, indicating "horizontal exchanges between equals from vertical exchanges between unequals" (Foster 1961). It targets the poor who

have limited information and autonomy about political affairs. There is exchange of political support for material benefits. Mexico is regarded as a typical example of this model, with provision of material benefits such as "cash, caps, tee-shirts, pencils, lighters, dictionaries, bags of basic foodstuff, breakfasts, cactuses, fruits, vegetables, beer, washing machines, bags of cement, cardboard, sand, shovels, pickaxes, machetes, hoses, fertilizer, seeds, chickens, cows and sheep" (Schedler 2002). This informal interaction between the client and patron within the political space therefore remains a source of corruption (Gray and Whitfield 2014).

In Africa, the political patron sometimes refers to "godfather" more often than not commandeered the political computation at the national, State and grassroots levels. They capitalized on citizen's destitution to achieve political interests, thus, provides opportunity for rotational power among the aristocratic political cabals (Kura and Marquette 2007). It is believed that politicians who adopt stomach infrastructure strategy, involving distribution of material packages habitually gains the prominent support of the people. The lexicalization of stomach infrastructure is rooted in poor governance system orchestrated by political comprador. 'The reality remains that many Africans 'are hungry with little or nothing to eat and any politician that looks after their nutritional wellbeing is an astute statesman, a humanitarian and a shrewd politician' (George 2014).

In similar direction, politics of stomach infrastructure also legalized in Tanzania's electoral act, inculcating what is termed as "Takrima" which means "Traditional Hospitality." The clause allows every political contestant in the country to offer gifts such as clothes, money, food and building materials to the electorate during political campaign. This has been devised as a modus operandi and a stratagem of coaxing and entrapping citizens under the travesty of providing material benefits in exchange for vote by the deceitful politicians (Amundsen 2006). This principle was acknowledged that "you cannot lead hungry people" (Premium Times 2014). From similar point of view, Ojo (2014) argues that the trading of vote in exchange for material benefits becomes the order of the day, no matter how constructive are the manifestoes of political contestants, the fundamental consideration recurrently revolved around what the politicians can offer in preelection and during election. This belief is justified on a ground that, if the citizens do not get their democratic dividends during electioneering, they might not be able to have access to their political representative until the next election.

## Shifting the Blame of Corruption: Political Class or the Citizens

Several attempts have been made to link the current challenge of corruption in Africa with the political leaders. Such assumption has not only witnessed the test of time, but redefined the political atmosphere in which politicians/citizen's coalesce in fostering political corruption. Experience from country like Nigeria validates this hypothetical analysis that election cannot be won without providing money and some material packages for the electorates so that they can gain the political support of the people. This event does not only provide avenue for the politicians to look for illegitimate boulevard so that they can meet with the demand of the people whose aspiration is to get material needs. Having said that, it is important to observe that the money offered by the politicians in the pre and during election must be recurred back to the source where it was oozed.

In this milieu, electorates cannot be excluded from the league of political corruption in Africa. There are many occasions when politicians need to bear the burden of materials and monetary demands of political supporters, friends, and families. This takes inform of payment for children school fees, house rent, and assistance towards funeral. Consequently, some politicians have capitalized on the suffering of the masses to galvanize political supports. Thus, it can be argued that financial and material demands by the electorates have drawn politicians to engage in corruption (Gabriel 2015). The electorates prefer a political representative or government whose campaign strategies are tailored in line with provision of short-term material needs (The Sun Newspaper

2014). The prioritization of stomach infrastructure over social infrastructure therefore remains a platform for endemic poverty, corruption, underdevelopment, and democratic cruelty (Chazan 1992). Nevertheless, whatever rationalization that may be presented for the humdrum demands by the electorates from political contestants, it is essential to note that this democratic prototype remains an aberration for ideal democratic reality, and has sustained deteriorating social infrastructural development in Africa. Therefore, the two actors – political elites and the citizens cannot be rooted out from the web of political corruption in Africa, having examined their involvement in monetization of politics and adoption of stomach infrastructural policy which remains a substantial challenge in accomplishing sustainable infrastructural development in Africa.

## Concluding Remarks

In comparison, the nature of corruption in African emerging democracies, including Nigeria, Tanzania, Kenya, Democratic Republic of Congo, and South Africa dwells within a holistic paradigm and has demonstrated in the bureaucratic system, cultural posture of the people, and political institution. Therefore, it can be demonstrated that, the trend of corruption in Africa journeyed through analogous familiarity. The nature and stereotype of corruption in Africa showcases political patronage and cronies system, applicable in the various African states. However, whatever justification that might be used as a propeller of corruption in Africa, it is important to perceive corruption in the continent as a by-product of other "structural forces" such as "class formation on state power and public resources in the context of post-colonial underdevelopment" (Szeftel 2000, p. 429–430). It can therefore be diametrically demonstrated as "criminalization of the State" which is termed as "the routinization, at the very heart of political and governmental institutions and circuits, of practices whose criminal nature is patent" (Bayart et al. 1999, p. 66). It is perceived as "asymmetrical reciprocity" and institutional "patrimonialism" between the State and the governed which has led to "instrumentalization of disorder" in Africa's socio-political affairs (Chabal and Daloz 1999).

# Politics of Municipal Consolidation

Kohei Suzuki
The Quality of Government Institute, Department of Political Science, University of Gothenburg, Gothenburg, Sweden

## Synonyms

Municipal amalgamation; Municipal merger; Organizational change; Structural change

## Definition

Municipal consolidation refers to reducing the number of municipalities and increasing their scale in terms of geography and population by combining two or more municipalities.

## Introduction

This section explains municipal consolidation (In this paper, the words "municipal consolidation", "merger", and "amalgamation" are used interchangeably). Municipal consolidations have been widely used as a tool for administrative reform at the municipal level in developed countries. Consolidation means "[t]he action or process of combining a number of things into a single more effective or coherent whole" (Oxford University Press 2016). Municipal consolidation refers to reducing the number of municipalities and increasing their scale in terms of geography and population by combining two or more municipalities. Municipal consolidations have been planned or implemented with the hope of increasing efficiencies and effectiveness in the provision of municipal services by taking advantages of economies of scale. Economies of scale refer to the reduction of production of average costs arising from an increase in the volume of outputs. In the context of municipal consolidation, municipalities can provide more public goods and services at a lower cost per capita as the population served increases.

The purpose of this paper is to concisely explain what is known about municipal consolidations. This paper begins with an overview of global trends in municipal consolidations as a tool for administrative reform at the municipal level. Secondly, it will explain the main motivations for and arguments against municipal consolidations. Thirdly, this paper discusses critical issues pertaining to the municipal consolidation. Finally, a discussion and conclusion are provided.

## Trends in Municipal Consolidation

Worldwide, reforms of the administrative structures of municipal governments have attracted great attention among policy makers, politicians, and scholars. Such municipal reforms usually occur in one of two contrary directions: municipal fragmentation and municipal consolidation. While many developing countries have pursued municipal fragmentation and the creation of new

municipalities aiming at better service delivery, stronger local civil society, and more democratic decision making, developed countries tend to reduce the number of municipalities by consolidation in order to take advantage of economies of scale. In the U.S., municipal annexation, which is the process of increasing the geographic size of city by including an adjacent unincorporated area, is the most common type of local boundary adjustment (Edwards 2008). Municipal consolidation in the form of city-county consolidation, which is a merger of a city and county into one unified jurisdiction, is rare (Feiock and Carr 2000; Leland and Thurmaier 2005). However, municipal consolidations are a major form of municipal reform in most developed countries outside the U.S.

According to the OECD (2014), half of OECD (Organization for Economic Co-operation and Development) countries have planned or implemented municipal consolidations in the last 15 years. For instance, in Japan, the central government promoted municipal consolidations after 1999. This nationwide municipal consolidation reform reduced the number of municipalities from 3,232 in 1999 to 1,718 in 2014 (Ministry of Internal Affairs and Communications 2014). In Demark, the 2007 structural reform of local government reduced Danish municipalities from 271 to 98 (Blom-Hansen 2010). In Finland, the number of municipalities was reduced from 560 in 1945 to 416 in 2005 and 320 in 2012 through voluntary mergers (André and García 2014). In 1989, the New Zealand government implemented a major reform of local municipalities, reducing their number of municipalities from 454 in 1980 to 86 in 1990 (New Zealand Parliament 2014). Some countries such as Belgium (1975), Norway (1957–1967), and Sweden (1952) implemented large-scale municipal consolidation before 1980. See OECD (2014) for a list of countries which have conducted municipal consolidation.

Municipal consolidations can be either compulsory or voluntary, depending on countries and states. For instance, in countries such as Denmark, Greece, Sweden, and Turkey, forced municipal consolidations have been implemented. In other countries such as Finland, Iceland, Japan, the Netherlands, and Norway, consolidation decisions are on local voluntary basis. In Australia and New Zealand, whether or not municipal consolidations are voluntary or compulsory depends on the individual states (André and García 2014). In the case of voluntary consolidations, the decision often relies on local referenda (OECD 2014). Even when a merger decision is on voluntary basis, that does not mean that the central governments do not influence merger decisions or provide no incentive for municipal mergers. For instance, the central government of Japan carried out the Great Heisei Consolidation from 1999 to 2006. Although the consolidation was decided on a voluntary basis often through a referendum process or other means, the central government promoted municipal consolidations nationwide by revising laws and giving strong fiscal incentives for consolidation. This led to the reduction in the number of municipalities from 3,229 to 1,821 within a 7-year period (Yokomichi 2007).

The consolidation process can be classified into one-shot or progressive consolidations (OECD 2014). The national government may require or encourage many municipalities to merge at the same time. For instance, the aforementioned Great Heisei Consolidation from 1999 to 2006 is an example of one-shot consolidation reform. The 2007 Danish structural reform of municipal governments is another example of multiple consolidations carried out at the same time, reducing the number of municipalities from 271 to 98. Alternatively, in the progressive case, consolidations are not carried out at the same time. In this case, individual municipalities are allowed to carry out consolidation sometimes at their own pace and sometimes with a deadline set in advance (OECD 2014). For instance, after the period of Great Heisei Consolidation in Japan, the number of municipalities was gradually reduced from 1,821 in 2006 to 1,718 in 2014.

## Arguments for and Against Municipal Consolidation

Proponents of municipal consolidation have proposed several reasons in favor of amalgamation.

Among the several potential advantages, the most frequently cited reason is taking advantage of economies of scale to improve the provision of municipal services (Dollery et al. 2007; Fox and Gurley-Calvez 2006). Economies of scale refer to the reduction of costs arising from an increase in the volume of outputs. Larger municipalities in terms of population are able to provide municipal services at lower per capita or unit costs. Consolidating municipalities can reduce fixed costs and administrative duplication. For instance, merging three separate water plants into a single large one can reduce fixed costs such as equipment and administrative expenses and thus produce water at a lower cost.

A second argument in support of municipal consolidation is that larger municipalities can develop more professional staffs and specialized departments that cannot be acquired easily by smaller municipalities (Dollery et al. 2007; Fox and Gurley-Calvez 2006). For instance, amalgamated municipalities are able to hire staffs with higher expertise in regional planning or economic development and create specialized sections for specific purposes. Such advancement in administrative capacities can enhance the effectiveness of municipal services, and it enables municipal governments to respond to more diverse demands from citizens. Thirdly, some proponents of municipal consolidation emphasize the benefits of having more coordinated regional planning and economic development as a result of consolidation (Fox and Gurley-Calvez 2006). Consolidation enables municipalities to plan and implement more coherent regional and economic development plans within the enlarged area encompassed by the merged municipalities, which were otherwise planned and implemented by separate municipal governments. Municipal consolidations can also implement unified regulations regarding land plans and economic activities within the consolidated areas. Uniform regulation lowers the cost for private companies and land developers who otherwise would have to deal with a number of separate local government entities and a diversity of regulations (Dollery et al. 2007; Fox and Gurley-Calvez 2006). This improves the business climate and thus may attract more business and investment into the local area.

While municipal consolidations have been pursued with the hope of achieving the aforementioned potential effects, there have been criticisms against consolidation. Opponents of municipal consolidation, who tend to support fragmentation of municipalities, often cite the positive impact of competition among small municipalities for better service provision. The underlying idea behind municipal fragmentation is that competition among small municipalities leads to better public service delivery at or near lowest cost (Geoffrey and Buchanan 1980; Goodman 2015). According to this argument, competition among local governments will provide the opportunity for citizens to choose the municipality which provides the services and assesses taxes that best fit their demands. In addition, in large municipalities, municipal services are not tailored to citizen preferences because officials in large municipalities may not be familiar with local circumstances (Steiner and Kaiser 2016). Therefore, amalgamated municipalities may not be able to respond to local citizens' demands with sufficient details. Furthermore, efficiencies in service provision may be hampered by budge maximization in larger bureaucracies (Hanes 2015).

Another important criticism against municipal merger has been raised from the perspective of local democracy. The ancient Greeks considered as appropriate for a successful democracy jurisdictions that were large enough to be self-sufficient but small enough that citizens could get to know one another (Blom-Hansen et al. 2014; Larsen 2002). In modern political science, scholars have debated over jurisdiction size and the healthy functioning of democracy (Dahl and Tufte 1973). Opponents of municipal consolidation point out that people have less access to local elected representatives and the bureaucracy in larger municipalities (Vojnovic 2000). Such declines in citizen access can negatively affect various dimensions of local democracy, including interests in politics, political participation, political trust, political efficacy, citizen satisfaction, and functions of local councils (Hansen 2015; Kjaer

et al. 2010; Steiner and Kaiser 2016; Vojnovic 2000). Therefore, these advocators claim that municipal consolidation might damage the quality of local democracy and encourage smaller municipalities.

## Some Issues Regarding Analysis of the Effects of Municipal Consolidations

Despite the extensive arguments for and against municipal consolidation among policy makers and scholars, previous studies have not yet established conclusive results regarding the consequences of consolidation on the effectiveness and efficiencies of service provision (Allers and Geertsema 2014; Reingewertz 2012; Vojnovic 2000). Some studies find positive impacts of municipal mergers, while other studies find no evidence or negative impacts. Studies examining the effects of municipal consolidation on economic development are likewise scarce and have produced inconsistent results. Furthermore, there have been few empirical studies on the effects of municipal consolidation on the local economy covering nationwide reform data (Hanes and Wikström 2010).

Some studies find positive impacts of municipal mergers, while other studies find no evidence or negative impacts. Such inconsistency might be due to a failure to examine various contextual factors. For instance, the effects of municipal consolidation might be contingent on which entities merge or the composition of merger partners. The selection of the merger partner may affect subsequent merger effects. For instance, having a financially weak municipality as a merging partner may offset potential benefits of amalgamation such as improved efficiencies in spending.

Moreover, one may need to analyze municipal consolidation from the perspective of organizational behavior. Municipal mergers cause significant organizational change for those institutions affected by mergers. Local officials in the merged municipalities may not fully understand or accept the necessity of mergers. They may have anxieties or uncertainty about the changes and potential personnel loss that consolidations brings. Municipal managers in new municipalities need to manage resistance from local officials and successfully lead significant organizational change (Denhardt et al. 2015). Organizational merger is like a marriage. Compatibility of organizational cultures such as patterns of work behavior, beliefs and values, risk orientation, and achievement orientation are important (Denhardt et al. 2015). The degree of homogeneity in the organizational cultures of consolidated municipalities may also matter for municipal performance in the new, larger entity. New merged municipalities that have relatively heterogeneous organizational cultures among the partners may need more time to create a new organizational culture and to perform well than merged municipalities with relatively homogeneous organizational cultures.

Another issue that one needs to consider when examining merger effects is the role of leadership. Previous studies suggest that the mayor's leadership and capabilities matter for organizational performance. A mayor's qualities such as education, expertise, age, and experience can affect municipal performance (Avellaneda 2009). And so the consolidation effects might be contingent on the mayor's capabilities. A mayor with relevant expertise and experience may mitigate negative impacts. In addition, a mayor with the appropriate qualities may accelerate positive merger impacts. Thus, the mayor's leadership might condition the merger effects on municipal performance.

One of the other critical issues pertaining to the analysis of consolidation effects is that most studies tend to overlook the issue of the unequal distribution of advantages and disadvantages among merged units. When empirically measuring the effects of consolidation on municipal service provision and local economic development, previous studies tend to assess how consolidations affect service provision of and economic development in new municipalities as a whole. The unit of analysis is the post-merger jurisdiction. However, municipal consolidation may not uniformly affect all consolidated jurisdictions. When some

municipalities are merged into a larger one, it is likely that some areas within the post-merger jurisdiction could benefit from the merger more than others. Perhaps, some jurisdictions can gain more efficiencies and improve the effectiveness of municipal services more than other jurisdictions within the merged unit. Consolidation may positively affect local democracy for residents living in the central areas, however it may increase political alienation of citizens living in the "absorbed" areas in new municipalities. A municipal merger may boost local economic growth in some areas, however the effect may not be uniformly experienced within a merged municipality. Perhaps the areas that were absorbed by the larger municipality may gain less from consolidation. One important factor in the inadequacy of the research focusing on the gap in benefits within merged municipalities is the absence of sufficient data in the pre-merger unit. After municipal mergers, most cities do not continue to collect data in the pre-merger unit. The data collection unit tends to be the post-merger unit rather than the pre-merger one. Most existing studies assessing merger impacts tend to rely on only post-merger unit data, which consists of aggregated data from merged municipalities. Therefore, it is difficult to analyze how, for example, economic growth or levels of democratic participation have changed in the same area before and after municipal mergers. We still do not know the empirical results of the issue of the unequal distribution of advantages and disadvantages among merged units.

## Conclusion

This entry has provided an overview of municipal consolidation, its global trends, arguments for and against municipal consolidation, and some issues for future research agendas pertaining to the analysis of municipal merger effects. Municipal consolidation is defined as the reduction in the number of municipalities and increasing their scale in terms of geography and population by combining two or more municipalities. Municipal consolidation has been carried out with the hope of achieving improved efficiencies and effectiveness in municipal performance and better fiscal outcomes. While fragmentation of municipalities has been actively pursued in developing countries, municipal mergers have been a main means of municipal reform in developed countries. Almost half of OECD member countries have considered municipal consolidation as a significant tool to improve performance and fiscal conditions of municipalities.

Municipal consolidation can improve the provision of municipal services by taking advantage of economies of scale. Consolidations enable municipal governments to develop more professional staffs and specialized departments, which are expected to bring significant benefits to economic growth, urban planning, and social welfare at the local level. In addition, local governments are able to carry out more cohesive regional and economic development plans within the enlarged areas encompassed by the merged municipalities. However, policy makers and scholars who prefer municipal fragmentation are wary of the downside of consolidation. Municipal consolidations may reduce competition among municipalities, which may result in the loss of effectiveness and efficiencies in municipal services. Officials in enlarged municipalities may not be aware of local circumstances. Therefore, large municipalities may not respond to local citizens' demands effectively. From a perspective of democratic politics, municipal consolidations may reduce citizen access to elected representatives and bureaucracies, which may negatively affect the democratic activity of local citizens.

Despite a trend in municipal consolidations in developed countries, scholarly works have not yet found conclusive results regarding the outcomes of consolidations. The lack of consistent results might be due to the failures in considering contextual factors. This paper suggested some future research agendas for examining the effects of contextual factors on municipal consolidation. Factors such as the composition of merger partners, organizational culture, and mayor's

leadership and capabilities should be included when one examines the effects of municipal consolidations on municipal service provision and their fiscal outcomes. In addition, the paper points out the importance of using pre-merger jurisdiction unit data, in addition to data from the post-merger jurisdiction. The effects of municipal consolidation might not be equivalent within merged units. Consolidation may enhance economic growth in some merged areas. However, other areas, especially those which are absorbed by a bigger municipality, may not enjoy the same level of economic development. Policy makers and scholars need to pay more attentions to the inequality of benefits or drawbacks of mergers within merged areas.

## Synonyms

Bureaucratic politics; Clientelism; Developed state SLB; Developing state politics; Elite capture; Patrimonialism; Prebendalism

## Definitions

Street-level bureaucracy: Is the subset of public agency consisting of the cadre of civil servants (bureaucrats) who have contact with members of the general public (street) in the policy process. It is the face of government and the points of state-citizen interactions in social services provisioning. It is also the theory and practice of implementation and evaluation of policies at the frontline using relative discretional independence to innovate on or modifies policies of government to suit prevailing circumstances, perhaps poorly envisaged at policy-design level.

Patrimonialism: System of government based on nepotistic networking where reward channels and motivation reflect personal interests of certain principals and their agents in the allocation of public wealth and opportunities. The personalization of public office by a principal and the distribution of gains accruing thereto in such a manner aimed to maintain tenure, attract loyalty, and sustain service from the agent.

## Introduction

There is an ongoing debate on the roles of discretion, accountability, lack of resources, impacts of technology, and risks of corruption on street-level bureaucrats. These concerns stem from the central role street-level bureaucrats (SLBs) play in government especially in the contemporary time when the nature, essence, and responsibilities of government are changing rapidly in meaning and scope. This reality of change is depicted in the public administration movements – from Old Public Administration (OPA) all the way up to New Public Governance (NPG), of course with myriad theoretical debates underlining the various movements. So, why the "Old" and the "New"? The fact that societies and their demands have evolved profoundly, and are putting enormous and increasing burdens on government as the manager of social, political, and economic life, has continued to influence administrative reforms across many cultures even from ancient time (Farazmand 2009, 2012, 2017). As a body, government depends on SLBs to provide interfaces for state-citizen interactions in provision of public service in the new public administration era (Evans 2016). Thus, SLBs provide important avenues for the citizens' service experience and perceptions about their government, "as de facto policy makers" (Akosa and Asare 2017). Irrespective of forms of government, it has been observed that street-level bureaucrats determine quality of service and access to such service by the citizens (Tummers and Bekkers 2014).

It is interesting that despite that street-level bureaucracies have high chances of determining how they work, social culture plays significant roles in determining what constitute acceptable discretion and how the discretional powers of SLBs are exercised (norm) within administrative traditions. Thus, Akosa and Asare (2017) applied principal/agent theory to better understand the nature and behavior intentions of developing countries street-level bureaucracies, particularly in sub-Saharan Africa. Although relevant literature in this connection cuts across administrative contexts, prescriptive models for street-level

bureaucracy's reforms have been somewhat insensitive to the nuances of developing nations' street-level bureaucracy influencers such as political, economic, and cultural environments. In addition to the cultural cleavage considerations that shape societal life in developing societies such as communal life, primordial affection, consanguinity, ethnicity, and tribalism, there is the other problem of perverse leadership character among the ruling elite that tends to circumvent the exercise of discretion of street-level bureaucracy through the instrumentality of principal/agent relationships in meeting with the demands of the multiple accountability to the networks around an agent (Hupe and Hill 2007), often in developing countries' contexts not in favor of any stated public value but for the entrenchment of elitist political control in the widest reach of government. For instance, the "complimentary card" (referral) mode of public service recruitment in Nigeria largely utilizes tribal, ethnic, or family considerations to consolidate partisan loyalty networks (Ukeje et al. 2020a) than in producing public good. Thus, using a hypothetical principal/agent conceptual model, this entry considers previously understudied dimension of SLB, namely, how political principals and their street-level bureaucracy agents enact change in the public service process for mutual gains.

## The Concept of Street-Level Bureaucracy

Street-level bureaucracy (SLB) is a sociological theory that seeks to explain the work realities of frontline workers as they do government work, i.e., how they engage in making policies (discretion) that enhance their daily work performances (Cooper et al. 2015). Its concerns have been the practical and systemic dilemmas that confront frontliners in the execution of their daily assignments in the public service, the comprehensive field where the "hard, dirty and dangerous work of the state is done" (Cooper et al. 2015). As the frontliners interact with the people, they device routine strategies of beating down heavy loads of work or mass processing (Akosa and Asare 2017), relying on personal judgment to assign value to public needs and demands and allocate efforts. A process that may eventually lead to inclusion or exclusion of persons from the service meant for them (Cooper et al. 2015).

SLBs attend to large population of people with competing demands. However, the state resources at their disposal are usually limited to meet these competing demands. Also, because these needs can hardly be met by other service providers, the SLBs are compelled to device additional means of executing their jobs, often not part of the initial design of the implementation framework, a kind of coping mechanism since the challenges the frontliners face in their daily work are often poorly captured in the policy guiding their actions (Akosa and Asare 2017). This is because organizational policy appears like a general guideline or principle which does not foresee exceptional end-point cases in the frontline (Bergen and While 2005). And because organizational policies as guidelines are not flexible enough or does not possess the scope for the kind of needs that often surface in the frontline, especially in critical situations that make resorting to the bureaucratic process of seeking approval before action dangerous and put policy expectations at risks, frontliners sometimes task their ingenuity to device a course of action that best handles the challenge they face; this results in the exercise of discretion that leads to emergence of contingent policy different from existing one. Since the success or failure of any policy programs is a function of its governance, strategies, implementation, and the impact it has on the citizens (Idike et al. 2020) due to its accountability questions (Ukeje et al. 2020b). Therefore, the practice of SLB has implication not only for scaling up the governance ratings of the government but also for the overall reforms that improve the conditions under which the SLBs do their jobs.

## SLB Theory and Practice: A Contextual Explication

Popular SLB reform opinions have more often focused on the developed countries' cultural

realities – political, social, and economic (see Murphy and Skillen 2015; Cooper 2018; Nisar 2018) – and not surprisingly, the administrative experiences of these societies have always dominated SLB literature. All these reflect theoretical and practical developments in advanced societies of Europe and America and conceal some details of the practice outside these contexts. For example, according to Michael Lipsky, the American who developed the theory of street-level bureaucracy in the 1980s, workers manage challenging situations in the frontline by prioritizing clients, and this leads to unexpected policy outcomes. Workers are seen to have strong affection to helping the people receive adequate public service. According to Ukeje et al. (2019), provision of essential public services through implementation of government's programs and policies is the core object of public bureaucracy. They could even do this by undermining the priorities of the organization spelled out in its policies in a bid to satisfy or at least ensure happiness for a greater number of people. They see government or organizations as established to serve the people. With this at heart, they may even bypass policy guidelines to invent policies or chose course of actions needed at each point to serve the people's needs. It has been noted also that in addition to workers trying to manage pressuring situations by prioritizing clients, they also seek to justify their actions by placing side by side the needs of the people and the rules that guide their actions (Maynard-Moody and Musheno 2003). Thus, we learn from these opinions that SLBs of developed contexts are not only conscious about serving their clients, but they are also constrained and moderated by the rules of the state. They are careful about serving the people and at the same time upholding the state order to ensure the proper functioning of the whole system. The SLBs are seen therefore as both agents of the state and that of the citizens. Arguably, this practice of the SLBs is shaped by the political tradition and equality norms that guide these societies, particularly the strong democratic traditions of the developed countries. Governments of countries in this category exercise confidence in the ability of their public service outlets in providing equal access to opportunities for their citizens. The question then arises whether this ideal-type SLB can be found in developing societies. Scholars have observed that developing societies' SLB has been understudied (Pepinsky et al. 2017; Nisar 2018). It has been noted rather that bureaucratic politics is prevalent in developing societies (Pepinsky et al. 2017) and that depoliticization of the bureaucracy has impact on their work (Cooper 2018). However, depoliticization of the bureaucracy in developing societies is somewhat a slippery idea just as it is in the developed ones. What is rather significant is the nuanced degree of professionalization of the relevant agencies in terms of non-personalization of public processes and procedures as well as "popularity of alternative performative ethics" in postmodern public administration (Santis and Zavattaro 2019), such that "in the shadow of post-modern condition, administrative ethics can no longer rely solely on bureaucratic codes, professional obligations, and/or democratic ideals as basis for proper behavior" (p. 2). For example, there is presently bureaucratic pushback against what is presently considered the excesses of the President of the USA, President Donald J. Trump, a movement now known as "Trump resistance" (Santis and Zavattaro 2019, p. 2). There is, therefore, intricately influential link between politics and bureaucracy that sometimes even circumstantially blurs the bureaucrats' sense of commitment to public good and notions of political neutrality; and this is not peculiar to developing countries. For instance, in contrast to the highly personalized administrative culture of Nigeria, there is a notion of "collectivism" in the administrative philosophies of most developed countries, perhaps because as El-Rufai (2013) argued: "To provide social services: security of life and property, decent schools, health facilities, and even a financial system-requires collective action. . .," hence, the need to work together to produce the desired public value. When this expectation is threatened by some overarching set of principles, values and ethics begin to take on new meanings that tend to challenge "business as usual" (Santis and Zavattaro 2019), because "if 'reality' is socially constructed by and within communities, no absolutes exist." But are the so-called postmodern political spectacles that

inspire emotions and group identification new and strange in the context of modern administrative ethos? If it is, then the developing worlds never have followed modern administrative trends in the first place.

## Understanding Patrimonialism and Prebendal Clientelism in Nigeria

One of the prominent features of the developing countries' politics is the resilient social ties that dot the public landscape. These networks are often leveraged as media for rewards allocation in the public sector wherein sycophancy, hierarchy, and tradition is anomalous to courtesy, frankness, and pragmatism (El-Rufai 2013). Indeed as he further observed, a developing country like Nigeria is confronted with "institutional weaknesses," and the capacity for people to help themselves is limited.

He clarified:

> To those aspiring to a career in public service, be prepared to be tested in ways impossible for you to foresee. . .there will be no shortage of voices surrounding you aiming to distract or persuade you from the fact. . . as things stand currently, we have surrendered the bulk of our political space to the dishonourable, the incompetent and worse , to the criminally-minded. . . this is an undeniable fact; the dregs of our society dominate the politics and have created a negative image that makes talented people spurn helping the country.

Yet, these "dregs" remain very popular across public spaces. Interestingly, even the introduction of Western system of sociopolitical order has not been able to rid the people of these characteristics. Rather, these two contrary organizations of societal life have been struggling to cope over time; at best, the result has been the erosion of the boundary demarcating the two. This further keeps transforming into new realities of sociopolitical life where allegiance is to the temporary government rather than the permanent state leading erosion of the ordinance of deservingness and norms of fairness in the society at large. It is therefore necessary to search for theory that underpins this developing *state reality*, which will offer adequate explanation for their experiences beyond the alternatively held pro-developed states' ideal-type SLBs largely constrained in their contexts.

Accordingly, patrimonialism was a concept coined by Max Weber (1978) to describe the administrative system of government on the basis of self-rule characterized by distribution of benefits in exchange for support, loyalty, and service. Political office holders are more concerned about deepening their roots in the system to ensure total influence and zero opposition. They seek a political environment where they have effective control of public institutions. They also mobilize every instrument of power domination to bring every segment of the state under their complete control. Ikpe (2009) identified five principal characteristics of patrimonialism as follows:

1. Political power is controlled by a personal ruler or a cabal of patrons or both.
2. There is an absence of separation between public and private realms for state officials.
3. Political offices are regarded as personal rewards and benefits for officials.
4. The exercise of public authority is utilized to serve rulers and officials.
5. The system operates through numerous patron-client networks and relationships.

Every political system retains certain characteristics of patrimonialism, namely, neo-patrimonialism, prebendalism, and clientelism (Ikpe 2009). It depicts a perverted democratic practice and corruption of its values, captured in the political culture involving sometimes vote buying and selling and "job for the boys" who aid the democratic heist.

Similarly, prebendalism is concerned with the acquisition of political offices not with a sincere intention of initiating new policies or policy reforms but for rent extraction (unearned income) in the state (Adebanwi and Obadare 2013). "What distinguishes prebendalism from patrimonialism is the absence of authority of the personal ruler and the existence of a feigned legal-rational order and, sometimes, a democratic facade" (Ikpe 2009, p. 682). Prebendal politics is concerned with intentional seeking of public office to acquire its instrument of power for the exploitation of the political

**Politics of Patrimonialism, Influence of Principal/Agent Relationships on Discretionary Powers of Street-Level Bureaucrats in Nigeria, Fig. 1**
A hypothetical principal/agent building blocks and sphere of influence. Key: MM = major influence, MT = moderate influence, Mm = minor influence

and economic benefit of the state. Similarly, clientelism is a network kind of mutual relationship between two economically and politically unequal actors which enables mutually exclusive or common gains to the greater and to the lesser in the prevailing power arrangement (Walle 2007). It is also the transformation of "economic privileges into political advantages through patronage" (Omobowale and Olutayo 2010 p. 2). Clientelism is concerned with the enlisting of personal relations or friends into a network of people with whom to share mutual benefits. This usually involves two kinds of parties, namely, patrons and clients. Patron-client networks can be groomed over time gradually and often form chains of patrons and clients. That is, a patron can be a client to another patron higher in power or rank and so on.

## Patrimonial Influence on SLBs Discretionary Exercises in Developing Contexts

Nigeria experience paints a vivid picture of a developing state SLB politics. For example, arguments for administrative reforms have focused on politics/administration dichotomy, particularly at the time of Woodrow Wilson in the USA. Today, this debate continues to influence developing nations' public administration research. It is clear that what is most plausible is "degree" of neutrality rather than the nonpartisan debate for bureaucrats. Nigeria, from independence, experienced tremendous increase in the number of public agencies. By 1998, the state was responsible for over 5000 board appointments for 588 SOEs, incurring #265 billion in expenditure (Mustapha and Imuetinyan 2016). However, the establishment of these public outfits did not impact positively on the way services were rendered. Criticism and pressure for reform from both internal and external forces have become rife. In response, the Nigerian government is presently experimenting with privatization as a means of devolving public service delivery functions to more competent private establishments.

However, though it appeared that the leadership was influenced to decentralize service delivery especially by involving the private sector either under PPP arrangements, devolution, partial sell, licensing, or outright sell of public enterprises, the background processes of this transition underscored the reality of developing state politics and the patrimonial character of value allocation in the public process. It has been observed somewhere that decentralization reforms were merely strategy of regime maintenance and extension of patronage networks (Clausen 2020).

The privatization of public enterprises in Nigeria was simply the personalization or commoditization of these outlets. The political elite sold the structures to themselves and used them as a

patronage extension. The patron-client network was built over time and maintained. Appointments into the service delivery outlets were based on "Ima mmadu" (whom you know), that is, connection. In the clientele networks, the patrons were the political hegemonistic, responsible for managing, moderating, and maintaining the network of relationships. As stated earlier, the system served as instrument to punish those perceived as rebels, and actions that qualify as rebellion are measured by the extent of incongruence with patrons' interests no matter how pro-public interest they are. Implications for "rebellion" are always devastating. The "rebellious" clients could be ejected from the networks, denied their job, and even sometimes eliminated in other to cover up the secrets or ordinances of the networks. This point of view is so clearly illustrated in the memoirs of El-Rufai and former President Jonathan quoted earlier, considering their positions and experiences as FCT Minister and now Governor of Kaduna State and Deputy Governor, Vice President, and President of Nigeria, respectively. For fear of consequences, clients at the frontline are often constrained to prioritize the interests of their employers (patrons) rather than public interests. Thus, Ikpe (2009) admitted that the prism of Nigerian political space should not only be restricted to the fallouts of religious and ethnic structure but attention should be given to its patrimonialistic character. Accordingly, "the problem with Nigeria was not simply endemic corruption, but the profoundly systematic, prebendal character of it" (Diamond 2013). Jonathan (2015) testifies further:

> It becomes compulsory for the politician to war for a ringside seat at the amphitheater, for differing incentives split under glory and greed. This does not detach glory from greed on very permanent basis, since humans could still be greedy, even about glory. . . Ambition scales up from the individual to clans, tribes, ethnic, corporate packs and curious religious projections. Indeed, it becomes a very fluid flux as they tightly mesh into each other under deft programmers such that the lines become so blurred between individual goals and ethnic aspirations. . .Such powers which nudge "independent" agencies like the judiciary, police, and army etc. to act in tandem with a president's body language; presidential gestures which numbs ordinances and assumes for a presidency the status of the more supreme court. The final election umpire. The swift jailor and the ultimate carrot and stick bearer.
>
> As nations team up against each other on global battlefields, so it is in the Nigerian polity, with political champions completely swept away from sincere representation in most cases. Financial corruption should be Nigeria's least and lowest on a list of worries. The systemic corruption which enables financial corruption in perpetuity should be the largest single corruption.

The wave of democratization that swept through the developing societies in the 1990s also had significant impact on the political culture of the Nigerian state. The transition to democratic rule post 1990s was also followed by the transformation of the patrimonial character of the larger society. This period ushered in the subtype known as neopatrimonialism in interplay with the existing subtype. During this time, thugs were indiscriminately recruited by agents to wrestle the electoral process in favor of their principals and to bring down opponents if opportunity permitted. As compensation, these agents eventually retained privileged positions of influence in government after their political bosses won election into various offices they aspired to occupy, and expectedly, they have continued to influence processes of public service recruitment into public offices often in disregard for procedures and recruitment best practices (Ukeje et al. 2020a). This creates the setup where employee loyalty is more to the principal who also is loyal to another higher in rank and so on rather than to the government; after all, humans are the government. Sometime ago, the new Chief of Staff to President Buhari declared openly during media interaction at Abuja that he is "loyal to President Buhari only and not to Nigerians."

## Ambiguity of Discretionary Roles

This arises where there is no policy specificity in process and policy goals, giving rise to multiple notions about the same phenomena (Hupe and Hill 2007). These multiple notions arise from the ambiguity of loyalty among SLBs in Nigeria. For instance, there is a popular practice among civil

servants in Ebonyi State where staff discipline is approached from the perspective of network influence. Due disciplinary measure could easily be averted by a simple phone call made to the disciplining authority by the offender's principal or any other influential member of his network working with the disciplining authority. Teachers who were contravened for not coming to school and not preparing their lesson plans and who were scheduled to lose their salary for 1 month easily scaled the consequence by "seeing" the junior officer delineated to effect the punishment; and the negative behavior intention continues in circle between the SLB who himself is an agent to a political authority and his own agent in the ministry in a show of discrimination and favoritism (Akosa and Asare 2017).

## Conclusion

This entry has examined SLBs exercise of discretion from the prism of principal/agent relationship within the discourse of interest sharing. Whereas previous contribution (Akosa and Asare 2017) has applied this principle vertically to understanding popular influencers of SLBs behavior intentions as agent of the state or government, it has been used here horizontally to explicate further incentives for patterns of behavior by SLBs as agents of principals in the fluid contest of self-interests within and outside government circles. The findings captured in a hypothetical principal/agent building block relate the possible incentives not limited to political culture, bureaucratic norms, social values, poverty, and the psychological needs for security and self-preservation see: (Figure 1). These needs are seen to drive network of relationships that in turn influence SLBs behavior intentions. These findings extend literature beyond widely held notions about SLBs as agents of positive change, who exercise discretion to overcome workplace constraints to create the desired public value, especially within the contexts of developing nations. While developed countries SLBs may have been able to define the line demarcating politics and public service and self-interest, the political/cultural order that created the developing countries' SLB tends to blur this thin line and so creates responsibility chaos leading to policy capture and challenges to maneuvering the terrain of cultural complexities to engender efficiency and effectiveness in the public service (Ukeje et al. 2020a) capable of improving public trust ratings (Idike et al. 2019) of SLBs.

## Definition

| | |
|---|---|
| Implementation | It involves a general political and technical process of enforcing government intentions, decisions, and programs to address societal pressing demands or needs. |
| Public policy | It is a general course of action or inaction followed by a |

| | |
|---|---|
| | government or its agents in dealing with a problem or matter of concern. Such course of action or inaction is targeted at peculiar outcomes. |
| Politics | It involves the use of state authority and [discretion] to determine how policies, decisions and resources target particular groups or sectors (perhaps and not others) in a political system at any given time. Many forces and considerations do shape how policies get designed, including the pattern and manner of implementation. Politics determines the questions of society entailing who gets what, how and when [and perhaps who pays] (Lasswell 1936) |

## Introduction

Why do most policies attempted at addressing socioeconomic woes in developing countries fail? Are there missing links or gaps in the policy process? These questions have occupied center stage in the continuing debate over the capability of developing countries to deal with the myriad of socioeconomic challenges confronting them. One school of thought points to the inability of the state to design context-relevant policies and programs to deal with context-specific problems (see Massey 2009 on *mimetic isomorphism* and *coercive isomorphism* which suggest directly transferring policies from one context to the other). Many other analysts argue that there are several well-designed and well-intended policies, but the missing link is rather [enforcement laxities] the knack and will of the state and its institutions to effectively implement these policies (Brinkerhoff 2000).

Although stages in the policy process are closely interwoven, the implementation stage is of critical importance to the success of governments in the quest to addressing socioeconomic challenges. This point is forcefully brought home by Sapru (2004) who contends that "however good the political system, however noble the goals, however sound the organizational structure, no policies can succeed if the implementation does not bear relationship to the intentions of the policy adopters. . .studies show that the implementation stage is the most important and yet the most neglected" (Sapru 2004: 149). The conclusions of several studies and discussions have been that the policies exist; rather what is left is effective implementation (Carbone 2011; Tetteh 2012).

Besides the acknowledgment that the implementation process is administrative or technical in nature, it is also largely political and involves governance decisions, appointments, coalitions, and networks in dealing with complex and ill-defined societal problems, especially in the post-NPM era of network governance (see Salamon 2002). This makes it imperative for scholars to reflect on how the practical and political complexities of policy implementation can offset the potential net gains, so that societies are not drawn into a cycle of merely replacing *failed policies* with newer and perceived better ones. How does politics influence public policy implementation? The circumstances surrounding Ghana's National Health Insurance Scheme provide prima facie case of how politics could affect a policy process; however, the literature has left this phenomenon [politics conundrum] largely under discussed. The main object of this study is to examine the political milieu of the NHIS policy cycle with special focus on the implementation phase. This paper makes a modest contribution to the literature on political context of social interventions in African countries by adequately discussing five political elements which shrouds Ghana's NHIS that have hindered the effective implementation: *The political haste in passage of the bill into law; technical and political imperatives [technical alienation?]; power play among actors and institutions; appearance of partisanship in strategic appointments and 'street-level' politicking.*

## Theoretical Framework

### Politics and Implementation

Over the years, there has been the realization that implementation is not merely a technical exercise but also an inherently political activity. Thus, implementation of policies involves far more than a mechanical translation of goals into routine procedures. Ripley and Franklin (1986) argue that the perceptions held by individuals involved in implementation of programs and policies about what is at stake in the decisions that must be made have an important impact on the nature of politics surrounding implementation. In other words, the nature or type of policy determines the politics around it. Grindle (1980) also contends that implementation involves fundamental questions about conflict, decision-making, and who gets what in a society (see also Lasswell 1936). The author contends that implementation is frequently a highly political process and that the implementation stage is an arena where those with interest in a policy engage in negotiations over the goals of the policy as well as conflicts over the allocation of resources. Thus, there are numerous political clashes over the allocation of resources at the implementation stage. These clashes are also characterized by politics based on factions, patron-client ties, and other affective forms suited to individualized demand on the bureaucratic apparatus for the allocation of goods and services (Grindle 1980). It is this interaction that these scholars refer to as the politics of implementation, thereby underscoring the existence of a politics-implementation nexus.

## Political Settlement

In the contemporary literature on policy implementation, particularly, on developing countries, the crucial role of politics in implementation is captured by the concept of political settlement (see, e.g., Khan 2011). The term "political settlement" is used to describe the informal power arrangements between and among key actors, interests, and institutions in a country or a "social order" within the system. The concept captures the complexities that come about as political, and sometimes bureaucratic actors use their influence to shape and control formal governance structures and policies to advance their own interests. In most cases, it is this coalition of powerful elite factions making up the key actors in a political settlement that determines the nature, form, and direction of public policies and not how well thought through the policies are or how well resourced the implementing institutions are (Khan 2011). Abdulai and Hulme (2015) reinforce the dominance of political settlement in developing countries when they argue that effective implementation of public policies is not necessarily the result of good formulation per se but the extent to which the power relationships surrounding those polices agree. From this perspective, policy implementation is seen as resulting from an intense process of inter-elite bargaining and can only be effectively implemented to the extent that those who have the "holding power" agree to the rules of the game (ibid). This view is quite instructive because it directs attention to the inherent structural influences that bear strongly on the implementation process. The essence of this perspective lies in the acknowledgment that even if all the other factors (resources, effective communication, and a well-resourced implementing agency) are met, it will take some consensus on the part of the power holders to guarantee effective implementation.

## Methodology

The study is positioned within content analysis of qualitative research approach. It is largely driven by secondary sources of data. The design is a content analysis of relevant policy documents including, inter alia, NHIA Act 650 of 2003, political party manifestoes [1996 and 2000 manifestoes of NDC and NPP prior to 2000 elections that influenced the birth of NHIS in 2003], and other written reports. The data is sourced from government agencies and their websites, conference and lecture proceedings, newspaper publications, and journal articles.

## Discussion

### Political Context of the Policy: The Haste and Laxities in the NHIS Bill/Law

Discussions of the possibility of a universal health policy in Ghana had always been in the background in the 1990s, though it became a key electoral issue in the heat to the 2000 general elections (Ayee 2001). For the New Patriotic Party (NPP), even while in opposition, the party had condemned the then existing "cash-and-carry" system as "notoriously callous and inhuman" and promised to replace it with a more equitable system of health insurance. The NPP's election platform made it plain that the party would "abolish the iniquitous cash-and-carry system," so that "nobody in Ghana will be denied medical attention because of his or her inability to pay and that payment of fees, if any, will be discussed when the patient is out of danger" (NPP Manifesto 1996: 36–37). Hence, for Ayee (2001), the health reform introduced by the NPP was the result of its long-standing effort to capitalize on the unpopularity of cash-and-carry.

A content analysis of the ruling party at the time, the National Democratic Congress (NDC) pre-2000 election manifesto, reveals their own political indifference, slowness, and inability to offer an immediate alternative to replace their unpopular cash-and-carry system. As indicated in their manifesto, they maintained that "feasibility studies on the proposed Health Insurance Scheme had been completed, the scheme will be tested on a pilot basis and if successful, it will be introduced on a national scale" (NDC 1996). Haunted by pressure from Ghanaians and their main political opponents, the NPP, they hurriedly broadcast an alternative strategy on the eve of the 2000 election; a proposal of a "mix of insurance schemes" which was meant to work side by side with a "reviewed" and "improved" cash-and-carry system rather than fully replacing it (NDC 2000).

It was within this politically charged context that the NHIS was implemented by the NPP in 2003, 3 years after winning power. Indeed for a country like Ghana – with a quarter to a third of its people living in poverty, a high number of informal workers, a prevalence of rural dwellers, and a relatively poor infrastructure – this represented a bold policy, as the new legislation marked the first attempt in the region to institute a nationwide insurance scheme with the ambitious goal of achieving universal coverage (Sulzbach et al. 2005). Consequently, most Ghanaians welcomed the NHIS, although many opposed the government's funding plan and the haste with which the bill was being processed. Organized groups particularly the trade unions and international bodies like the IMF advised the government to tread with caution (Wahab 2008). Be that as it may, the government felt pressed to stick to its own election pledges and sped up plans for the reform. According to Carbone (2011), this was mainly because the new government was anxiously on the lookout for concrete policies that it could showcase in seeking a renewal of political mandate in the next election. The government rushed through the processes just to fulfil a campaign promise in time, and this led to the failure to establish a full-proof mechanism of funding the scheme. It also left gaps in enforcing its core legalities as well as adequate deliberations with stakeholders (Agyepong and Adjei 2008; Wahab 2008). Though the bill got passed into law in the end, the battle lines had clearly been drawn and entrenched positions taken. The unresolved tensions and dissatisfactions were only transferred to the implementation stage (Grindle 1980).

This haste and poorly "muddled through" means of funding as well as failure to address accountability loopholes in the bill is what has led to the persistent financial albatross and associated corruption hanging around the neck of the scheme. The scheme has been battling with increasing debt owed various service providers in the country. Even with a current value added tax (VAT) rate of 17.5%, a National Health Insurance Levy of 2.5% and the Social Security and National Insurance Trust (SSNIT) contributing up to 94% of its funding, urgent calls are still being made for additional sources of funding to avert collapse of the NHIS (NHIA 2015).

### Technical and Political Imperatives: Complementarity or Competition?

Contemporary public administration thinkers make a case for complementarity between policy-making and implementation critiquing the classical Wilsonian dichotomy. According to Svara (2001: 179) "in contrast to the politics–administration dichotomy, the complementarity view supports broader policy-making responsibilities for public administrators, along with significant involvement of elected officials in policy implementation. . .. administrators complement elected officials in the policy-making process by helping them shape policy and by giving it specific content and meaning in the process of implementation. . .." Owing to the significance of technical and expert role of technocrats, as early as 1966, Omanboe called for some restraint with political decisions after noting how all important projects at the time had to be initiated by politicians who committed their countries and people to certain courses of action before technocrats are consulted (Omanboe 1966). This raises a bigger question of whether *politicians engage technocrats in a genuine and deliberative manner over policy content and processes or merely consult them as a mere formality?*

In the case of Ghana's NHIS, serious tensions characterized the implementation of the policy. The politicians after taking the decisions mainly based on political calculus also got involved in "bulldozing them through" in ways and manner that were sometimes incongruent with the technical plans of health planners and managers. Agyepong and Adjei (2008) point to the level of these tensions by noting that "as the work of the committee set up to design the health financing reform appeared to slow down because of technical concerns and recommending building on existing local mutual health organisations and continuing the piloting, its composition was changed to better reflect the political priorities and the haste of the executive." Thus, no time could be wasted on technical details; new political nominees came to dominate the drafting process in the committee, whereas the traditionally strong role played by the technocrats of the Ministry of Health – some of whom were proving too cautious, or even sceptical, about the reform – was downsized (Atim et al. 2001). For instance, technical committees appeared to be rubber stamps in the process, "the trusted political associates remained so powerful in the decision-making process that sometimes technical working groups noted decisions on the issues they had been charged to work on had, in effect, already been taken" (Agyepong and Adjei 2008: 156). In his policy alienation framework, Tummers (2012) defines *policy alienation* as a form of strategic powerlessness conceptualized to involve a "form of powerlessness that occurs, for example, when a new policy is drafted without the help of professionals, for example, by failing to consult professional associations or labor unions" (Tummers 2012: 518). The unresolved conflicts with the NHIS consequently led to low patronage, particularly from the sceptics who adopted a "wait and see" attitude thereby stalling the building of the pool needed for effective implementation of a social insurance scheme especially at the initial phase (see Atim et al. 2001; Grindle 1980).

### The Politics of Strategic Appointments: A Political Calculus

Several studies on the nature and functions of public services in Africa and other developing nations have relied heavily on the use of the concept of neo-patrimonial state (Kelsall 2011). This refers to the state in which there is a weak sense of the public good or of public service, and where the resources of the state are at the disposal of the executive (president and his ministers) who use these to reward and to co-opt adherents in a patron-client continuum. Like other public agencies, the National Health Insurance Authority (NHIA) has also been at the mercy of politicians. Characteristic of all public institutions, the government of the day reserves the right and responsibility to make appointments to the authority, especially, to the top positions. The chief executive officer (CEO) who oversees the management of the authority is appointed by the government and appointment to this position is largely done from a purely political calculus and logic. The main consideration has been "who will best serve our interest as a party or individual." Thus, appointment of the NHIS boss changes when

there is a change in government, and the two parties that have been in power since the implementation of NHIS have brought on board their own CEOs. This is consistent with the practice in Ghana, where heads of public institutions are predictably asked to proceed on leave whenever there are political alternations. In 2009 [ruling NPP government lost power in a general election], for instance, the CEO, Ras Boateng, was summarily replaced by Sylvester Mensah (NHIA 2009), a vociferous member of the ruling NDC [new government]. More worrisome is when key actors and officers of the scheme are seen in the media engaged in active partisan politics which appears to make the scheme and its implementation more politically underpinned.

### Street Level Politics and Appointments

More related to the above, it appears one has to be a member of a particular political party [ruling party] at any point in time to be able to get a job at the NHIS which is been used as a "job for the boys" of the government of the day. Grounds for such belief abound in the Ghanaian media which reports local party members hijacking NHIS offices at the district level. In August of 2010, for instance, myjoyonline.com reported of rampaging youth of the NDC [ruling party] in the Zabzugu constituency in the Northern Region forcibly taking over the offices of the NHIS in the area. The irate youth allegedly chased out the scheme manager on suspicion that he is loyal to the New Patriotic Party [opposition party] and was getting NPP people [perhaps appointing objectively instead of giving jobs to only the ruling NDC members] on board. While these struggles are only a tip of the iceberg, it points to the twists and turns in tinkering with policies usually for political survival and perpetuation of party interest. It is within this context that civil society organizations (CSOs), for example, the moderator of the Presbyterian Church of Ghana, called for a cessation of the politicization of the operations of the NHIS in order not to cause its collapse, reechoing the need for the government to employ technocrats and not just party faithfuls (*Daily Graphic, Sep 10 2015*). On a key question of what makes a policy successful, Mead provides a swift answer that "in the recipe for success, strong administration is probably the most crucial single ingredient" (Mead 1997:122).

## Conclusions and Policy Suggestions

This paper has analyzed the politics of the policy process and how it culminates in the implementation phase using the case of the NHIS in Ghana. The study has demonstrated that the implementation process is not just a technical exercise but also an inherently political activity. The experience of the NHIS points out that the phases in the policy process are very much interlinked and closely interwoven; the elements that occur in a prior stage feed into or have ramifications on the subsequent stages. In other words, there is a subsequent forward loop and the better we carry out the earlier phases, the smoother the subsequent stages. On the other hand, a well-rushed through or poorly "muddled through" policy formulation will meet the very challenges that were glossed over along the way. A policy-maker who fails to prudently address significant concerns at the formulation phase lives to fight or meet the same concerns [perhaps exacerbated] at the implementation phase.

Policy elites should endeavor to enable stakeholder involvement and some form of consensus and commitment from bureaucrats or administrators right from the formulation phase. We posit that politics should be managed in such a way that it does not deactivate the technical competence of the implementation machinery. This is because "no matter how clear the policy message, no matter the level of capacity of a given state, and despite an appropriate formal organizational structure, skillful and committed program management seems important for implementation success" (Goggin et al. 1990: 130). Logically, it is quintessential to distinguish or perhaps, balance political party commitment with meritocracy to effectively execute public policies; and the lines should be drawn clearly.

There is the need therefore for wider participation in the formulation and implementation processes by the population or at least the target

group. As has been seen in the NHIS case, more often than not the target group is usually left out at the policy formulation stage, and the views of the few groups who have the opportunity to voice out concerns are easily ignored. The resultant policy so designed, therefore, fails to be client-oriented and alienates the very people for which it is targeted. The much needed ownership of the policy becomes difficult leading to apathy and subsequent failure.

# Politics of the Policyscape

Mallory E. SoRelle
Lafayette College, Easton, PA, USA

## Synonyms

Policy regime; Policy state

## Definition

A political landscape in which policies created in the past become durable institutions that shape the future politics of policymakers, organized interests, and citizens.

## Introduction

Creating public policy is one of the primary ways in which the state carries out the task of governing. It is, therefore, unsurprising that a great deal of attention has been paid to understanding how different political factors shape the public policies that are passed at a particular time and in a particular place. But public policies are not simply a product of politics. Once enacted, public policies – especially those that become enduring features of the political landscape – also have the ability to reshape future politics in important ways. Policies can influence the agendas and actions of both individual lawmakers and political parties. Policies can create or dismantle government agencies, commissions, and departments. Policies can affect the resources and political activities of organized interest groups. Policies can even shape the political preferences and behavior of ordinary citizens.

The following sections explore the dynamics of the so-called policyscape – the tapestry of public policies that, once created, shape the future politics of policymakers, organized interests, and citizens. This entry begins by explaining how public policies function as political institutions. Next, it explores how the policyscape influences the political preferences and behaviors of three main groups of political actors: lawmakers, interest groups, and citizens. Finally, it addresses the importance of policy maintenance and some of the obstacles to achieving it.

## Public Policies as Political Institutions

A political institution determines the "rules of the game" by which political actors must play. Political actors make strategic decisions based on these institutional constraints, and when new institutions emerge or when existing institutions change, the behavior of political actors will have to adapt to those developments. Over time, however, responding to the constraints of political institutions can become increasingly challenging. Once established, political institutions become part of the landscape upon which politics plays out, so politicians are rarely able to operate from a clean slate. Instead, political actors must contend with progressively more complex – and sometimes contradictory – institutional arrangements. These institutions are often created in a piecemeal fashion, layering new rules atop existing ones.

Political institutions are critically important to the political process, making them an obvious target for scholarly enquiry. Most prominent among the political institutions studied by social scientists are constitutional arrangements, electoral systems, and major branches of government (e.g., legislative, executive, bureaucratic, and judicial institutions). For many years, public policies were left out of the study of institutions, treated instead simply as institutional outputs. But over the last two decades, it has become increasingly accepted to consider policies, particularly those that become enduring features of a state's political scene, as institutions in their own right.

Public policies mirror the features of other types of political institutions: once established, policies create rules and incentives that political actors must contend with moving forward. And as with other political institutions, once a major policy is enacted for a particular issue, lawmakers must confront that policy any time they seek to engage in future legislative activity in the same area. Paul Pierson summed up this phenomenon in his seminal 1994 work on welfare state retrenchment arguing, "today's policymakers must operate in an environment fundamentally conditioned by policies inherited from the past" (p. 9). Scholars have used the term "policy state" to capture the idea that public policies serve as political institutions that structure subsequent politics. More recently, Suzanne Mettler coined the term "policyscape" to refer to a political landscape that is increasingly cluttered with existing policy

programs that influence the preferences and behaviors of a variety of political actors, including policymakers, interest groups, and citizens (2016).

## How the Policyscape Shapes Politics

Public policies are expected to create material or procedural changes in a specific issue area – for example, by introducing new drug sentencing requirements or allocating funds to build new bridges; however, a growing cohort of scholars have embraced the idea that new public policies can also create political changes. Through their design and implementation, policies have the power to generate what Theda Skocpol called "feedback effects" (1992). That is, once enacted, a public policy can reshape the preferences and actions of policymakers, interest groups, and citizens in several important ways (see Mettler and SoRelle 2014 for more in depth discussion of the following mechanisms).

### Policymakers

Once enacted, a new public policy can shape the political agenda, future policymaking activity, and day-to-day governing of policymakers – both elected officials and bureaucrats – in several interconnected ways. Public policies influence the political agenda of both individual legislators and political parties by creating constituent expectations about when and how the state will act in a particular domain. Once a new program is created, it sets the public's expectations that government should be involved in the particular policy area. Not only do ordinary citizens come to view certain issues as requiring government intervention, but policies that were forged by a particular political party often become associated with that party. The policy, and ideas for future amendments to it, becomes part of a party's political platform and can mobilize partisans in support of or opposition to future reform efforts. Policies can also affect the timing with which issues emerge on the political agenda. If, for example, a policy has a sunset clause after which it is no longer in effect unless reauthorized by legislators, or perhaps funding runs out after a certain date unless legislators extend it, the policy has already set into motion a deadline by which it must reappear on the legislative agenda.

In addition to shaping the political agenda, public policies also constrain future attempts to pass legislation in a number of ways. Perhaps most significantly, policies demand the allocation of resources for their implementation. Not only does this set a precedent for future budgets, but assigning resources to one area necessarily reduces the amount that can be spent in another. As the policyscape becomes increasingly cluttered, more and more resources are committed to maintaining existing programs. These resource constraints limit a government's flexibility to implement new programs in the future.

Existing policies also shape the alternatives that are considered when lawmakers seek to enact new legislation for a particular issue. The policyscape presents elected officials with an existing set of guidelines that they must grapple with when attempting to make policy. As a result, policymakers today are rarely able to design the most efficient or effective program from the ground up. Instead, tweaking the existing policy infrastructure often serves as the more realistic starting point for discussions of reform. Not only does this limit the types of solutions that can be adopted for a particular policy problem, but it also encourages incremental, rather than wholesale, policy change.

Finally, new policies often generate new organizational entities and operational procedures for the purpose of implementation, each with the potential to structure politics moving forward. Whether mandating the establishment of a new executive agency or a temporary commission, policies frequently create entire infrastructures dedicated to their administration and implementation. In doing so, a tremendous amount of resources are invested both in the creation of the new agency and its ongoing staffing and operations. Bureaucrats who run new agencies also become politically invested in the preservation of the existing policy program because their very

livelihoods depend on either maintaining or expanding the status quo. When policies create costly infrastructure manned by politically invested personnel, elected officials face a doubly difficult task in their attempts to reform existing programs. Dismantling and rebuilding a new administrative infrastructure is not only extremely costly in monetary terms, but it requires fighting against the political power of an established agency – often one that has formed collaborative relationships with the constituents it oversees who can bring their own resources to bear to prevent legislators from undoing the existing policy arrangement.

In each of these ways, the policyscape influences the strategic future behavior of policymakers. But those who make and implement public policy are only one subset of actors whose preferences and actions are affected by the policyscape.

### Interest Groups

Organized interest groups are another. Professional advocacy groups have proliferated since the 1960s, and many of them have emerged as a direct result of government policy. Public policies have the ability to create new constituent groups with incentives to organize in order to preserve or expand their benefits. The visibility and complexity of policy benefits (or costs) can also shape which types of groups emerge to support a particular set of policies. For example, some public policies are highly complex and administered in ways that obscure government's role in their creation and implementation. The average citizen is unlikely to organize around a policy that they can neither see nor understand, but industries that stand to profit (or lose) from these policies certainly have the resources and expertise to pay attention to them. As a result, complex regulations that aren't highly visible may lead to the creation of corporate interest groups but not public interest groups. By contrast, policies that provide highly visible benefits to ordinary citizens are much more likely to give rise to public interest groups.

The end result is that the policyscape shapes the types of groups that emerge to engage in future political contestation around a specific program. Some policies may give rise to a more diverse, representative array of organized interests that are capable of influencing future policy reforms, while others privilege the organization of the most resource-rich. The composition of organized lobbying that results from this phenomenon has the capacity to shape the democratic character of future policy reforms.

### Citizens

Finally, citizens themselves are affected by the policyscape in several ways. Perhaps most obviously, policies that provide benefits to citizens also give them incentives to support the maintenance and expansion of those benefits in the future. As larger numbers of people benefit from a policy, it can be increasingly challenging to remove or fundamentally restructure that policy without angering constituents. In this way, the policyscape can shape people's preferences for or against a particular policy program as well as the likelihood that they are willing to take action in support of those preferences.

Providing resources to people also shapes their political action in a second way. People with greater socioeconomic status – including those with more education, income, and other related resources – are more likely to participate in political and civic activity broadly construed. So when policies increase a person's resources, for example, by providing them with access to educational opportunities or raising the minimum wage, that policy is indirectly creating conditions for increased political engagement among the beneficiaries.

But public policies influence ordinary citizens' politics in two less obvious ways as well. First, public policies can teach people lessons about their own political efficacy and citizenship, affecting how they engage in political activity. When policies are created, decisions about whom they apply to create what Anne Schneider and Helen Ingram call "target populations" (1993). By creating target populations, public policies define who is a member of a particular group and who is not. They also provide a government endorsement of those groups who are worthy of benefits

and those who are in need of punitive measures to "correct" their behavior in some way. The language and remedy of a particular policy can ascribe norms to a target population that are potentially embraced both by beneficiaries and the wider public. The policyscape can, therefore, influence how people see themselves and the relative value of their citizenship as well as influencing how society, more broadly, evaluates a particular group.

Beyond creating and dispersing norms about a particular group's identity, the implementation of a particular policy can also teach beneficiaries lessons about the relative worth of their citizenship. For many people, interactions with various disbursement or oversight agencies serve as their main, and frequently their only, direct experience with government. As a result, interactions with these agencies can operate as a proxy for government as a whole. When people have positive experiences with the implementation of a public policy, they may feel valued and respected by government. Conversely, when people have frustrating or negative experiences with the implementation of a policy, they may feel that government does not value them enough to treat them well. These assessments have been found to translate into people's willingness to participate in politics in predictable ways: those who feel valued in their interactions with the policyscape have a greater sense of political efficacy and an increased likelihood of engaging in political activity; those who feel undervalued retreat from the political realm.

Interactions with the policyscape can also shape citizens' evaluations of government efficacy, with consequences for their political engagement. People who experience excessive red tape or encounter problems receiving policy benefits may come away with a negative evaluation of the state's ability to govern. When that happens, citizens may be less supportive of future policy proposals designed to expand government intervention in a particular venue. Having a particularly positive experience with a government program can produce the opposite effect. More recently, scholars have also found that public policies administered without an obvious government presence can also diminish people's preferences for government involvement on a particular issue.

## Social Security: A Case Study

US Social Security policy provides a good case to examine each of these dynamics in action. President Franklin Roosevelt signed the original Social Security Act into law in 1935. Initially envisioned as a program to provide old-age insurance, the policy has been amended over the years to extend benefits to other groups as well, including widows and dependents. Social Security is credited with keeping nearly a quarter of elderly Americans out of poverty, but its funding structure is becoming increasingly unsustainable as the potential number of beneficiaries outpaces the number of people whose payroll taxes support the program.

Since its enactment, Social Security has undoubtedly reshaped the political behavior of policymakers. It has become a landmark piece of legislation associated with the Democratic Party, and most subsequent proposals to expand or reform the program have divided along partisan lines. The presence of the existing policy institution has also shaped the alternatives that policymakers consider. Rather than fundamentally reimaging the whole approach to old-age insurance – a tactic that has been dead on arrival whenever policymakers raise the possibility – attempts to reform the program to accommodate its rising costs frequently revolve around incremental revisions, for example, changing the age at which beneficiaries can receive payments. The resource constraints imposed by the program – Social Security accounted for more than one third of all US government expenditures in 2013 – also restrict the ability of policymakers to consider enacting new policy programs that would require significant expenditures. Finally, Social Security created an enormous physical and personnel infrastructure to administer it. To dismantle the program now would not only waste the resources already sunk into that infrastructure, but it would also affect the jobs of more than 60,000 people working in more than 1000 offices scattered across the nation.

Passage of the Social Security Act also shaped the subsequent behavior of organized interest groups. New groups, like the National Committee to Preserve Social Security, emerged, and other interest groups, like AARP, would eventually allocate substantial resources to lobby in support of maintaining and expanding existing benefits. On the other side of the political aisle, interest groups representing the financial industry, which would benefit if social security were privatized, and other conservative coalitions have dedicated time and money to lobbying for benefit reductions and other reforms designed to reduce government expenditures for the program. In total, the Center for Responsive Politics, a lobbying watchdog group, identifies over 600 groups that have lobbied on the issue of social security since 2006.

Of course, a substantial part of that lobbying effort has mobilized Social Security beneficiaries. The policy identified a target population of recipients who have coalesced to form a powerful constituency group to support the maintenance and extension of the existing program – something its proponents intended. Social Security is funded with a payroll tax, so recipients feel as though they are receiving a benefit they have earned and are willing to mobilize to keep receiving their deserved payments. President Roosevelt anticipated this reaction to the policy's design, famously explaining, "We put those payroll contributions there so as to give the contributors a legal, moral, and political right to collect their pensions and their unemployment benefits. With those taxes in there, no damn politician can ever scrap my social security program."

Social Security provides an excellent example of the policyscape at work. Not only has the presence of this policy fundamentally reshaped subsequent politics surrounding the issue of old-age insurance, but it also highlights the durability of policies over time. When policies establish administrative structures, incentivize organized interest groups, and empower ordinary citizens to support them, programs become enduring features of the political landscape. As the policyscape becomes littered with more and more permanent programs, lawmakers must devote increasing time to policy upkeep, or maintenance, in order to make sure these policies continue to fulfill their intended missions in a changing world.

## The Problem of Policy Maintenance

All political institutions require occasional maintenance to ensure that they are doing what they are supposed to without creating unintended consequences. Public policies are no exception. Policies passed in a specific historical moment may eventually require maintenance for several reasons. The way a particular policy is implemented may produce some unintended repercussions that lawmakers feel the need to eliminate. The population of a country may change in ways that render existing policies either unable to accomplish their goals or unsustainable in their current form. Better technology or access to new information may allow for policy solutions that were impossible to imagine in previous eras but that would provide a more efficient solution. The state may also encounter crises that require the implementation of radical new approaches, or perhaps the diversion of resources to other areas, to solve the emergent problem. All of these possibilities contribute to the need for ongoing policy upkeep, but maintaining an increasingly complex policyscape can be a challenge for two major reasons.

First, when policies reshape politics along all of the pathways discussed in the previous section, those policies become path dependent, or self-reinforcing. It is increasingly costly, in both monetary and political terms, to change course once a particular policy is adopted. Political legacies are attached to the preservation of the existing program. Interest groups and bureaucrats fight to maintain and expand programs. And citizens themselves become devoted to policies that benefit them, increasing their willingness to punish policymakers who attempt to scale back or fundamentally change those benefits. As more and more policies come into being, legislators face increased political pressure to sustain them. In many ways, the path-dependent nature of the policyscape makes governing a much less flexible and more challenging enterprise than that faced by lawmakers in previous eras.

The second potential challenge to the successful maintenance of the policyscape is that the political context may change in ways that make it difficult to revisit or reform policies in need of upkeep. An excellent example of this is occurring in the USA today. Since the 1970s, partisan polarization – largely driven by an extreme rightward shift of the Republican Party – has increased dramatically. Political moderates in the federal legislature have become largely extinct, making the distance between the two parties bigger than it has been in a century. The growing polarization of the two parties has led to a virtual standstill of policymaking operations. With the two sides increasingly unable to come to agreement on policy reforms, Congress has enacted fewer and fewer laws with each passing legislative session. Policy maintenance has been one of the major casualties. In the case of Social Security, despite a clear need for policy maintenance to grapple with the potential funding shortfall, Congress hasn't enacted major reform since 1983 – more than three decades ago. The same trend can be seen for a number of other major policy programs as well. Over the past decade, lawmakers have also increasingly had to resort to short-term funding extensions to keep major programs running because agreements for longer-term reauthorizations have been impossible to reach. Whether driven by path dependence or changing political contexts, the problems associated with maintaining the policyscape have potentially significant consequences for the long-term success of governance.

## Conclusion

The policyscape is an important political institution for any state. It has the ability to fundamentally reshape the political preferences and behaviors of a variety of political actors, including lawmakers, interest groups, and ordinary citizens. And as the policyscape grows, the task of maintaining it becomes increasingly difficult. Understanding the constituent policies that comprise a particular policyscape is necessary in order to understand the broader political dynamics for any state: What are the policy priorities? Who are the most powerful constituent groups? What are the prospects for policy reform for any given issue? These fundamental political questions cannot be sufficiently answered without considering the political effects of the policyscape.

## Definition

Politics of public policy is when the stages of the policy cycle take a partisan line.

## Introduction

### Public Policy Cycle

In public policymaking process, the government is a key policy actor. Public policy goes through the policy cycle. Howlett et al. (2009) identify five stages of policy cycle, namely, agenda-setting (problem recognition), formulation (proposal of solution), decision-making (choice of solution), implementation (putting the solution into action), and evaluation (monitoring results) (Howlett et al. 2009: 3). Public policy processes involve key policy actors from public (government) and private (nongovernmental) sectors. It also involves the decisions of political and nonpolitical actors. Policy issues require high expertise, more commitment, publicity, and resources. For this reason, policy scholars indicated that governmental actors alone cannot handle public policy issues (Hill and Hupe 2009).

Every stage of the policy cycle is very critical and that no stage/cycle should be taken for granted by policymakers or governing elites. Problem identification is the first stage of the policy cycle. This stage is very critical because a wrong approach has great consequences for the entire policy cycle. Howlett et al. (2009) indicate that what happens at the agenda-setting stage of the policy cycle has a great and decisive impact on the entire policy cycle. For instance, the policy made by few governing elites without views of the population or representatives may face some resistance at the implementation stage because of a lack of involvement of people or their representatives.

Policy formulation is the second stage in which key policy actors (elected politicians, appointed officials, mass media, political parties, interest groups, think-tanks, and the general public) suggest possible options to help solve the public problem identified at the agenda-setting stage. Policy formulation stage can face challenges as either as "substantive" or "procedural" (Hill and Hupe 2009; Howlett et al. 2009). For this reason, policymakers have to consider policy options more critically especially at the formulation stage.

The third stage of the policy cycle is policy decision-making. This stage Howlett et al. (2009) postulate is "where one or more, or none of the many options that have been debated and examined during the previous two stages of the policy cycle is approved as an official course of action" (Howlett et al. 2009: 139). This stage is very crucial, and policymakers must not rush over passing a bill into a law. Policy bills must be properly scrutinized in parliament if under a democratic regime as the case of Ghana.

The fourth stage of the policy cycle is where policy decision is put into practice. Many policy scholars consider this stage as the *most critical*. It is the stage where "funding must be allocated, personnel assigned and rules of the procedure developed to make a policy work" (Howlett et al. 2009: 160; Hill and Hupe 2009). In most countries, policy implementation is left in the hands of civil servants. However, in recent times due to the growing importance of networks, other nongovernmental organizations have become key implementers of public policies.

The final stage of policy cycle is policy evaluation. This stage assesses if the problem identified has been solved or not. If the policy is successful, it becomes a credit, but if it is unsuccessful, the policy has to go back to the agenda-setting for the whole process to start. Adding a theoretical perspective, Winter argues implementation results (outputs and outcomes) are not only affected or influenced by "prior policy formulation process" but other conditions in the implementation process on how organizations or interorganizational relationships respond to policy objectives (Winter 1990). Events that happen at each stage of the policy cycle are crucial for the success or otherwise of the policy. A country's political system can facilitate or impede the policy process.

## The Features of the Political System

### Constitutional Provisions

Ghana since independence in 1957 had a number of military coup d'états. The longest serving military ruler in Ghana's political history is Flt.

Lt. Jerry John Rawlings. He continued to rule Ghana until 1992 when there was domestic and external pressure to return Ghana to a democratic rule. Hence, Ghana adopted a new constitution in 1992 as the Fourth Republican Constitution of Ghana. Elected representatives are expected to consult their constituents on public policy issues so that the policies they make will reflect the wishes of the people who gave them the mandate.

Also, Ghana's constitution endorsed multiparty democracy. Article 55 (1) stated "the right to form political parties is hereby guaranteed" and in clause (2) "every citizen of Ghana of voting age has the right to join a political party" (Republic of Ghana 2005: 42). The 1992 Constitution also promotes media plurality. In Article 162 (1) "freedom and independence of the media are hereby guaranteed" (Republic of Ghana 2005: 101). This is to promote freedom of expression and safeguard journalism and ensure citizens can freely contribute to the issues of national interests including public policies without any arrest or intimidation (Republic of Ghana 1992, 2005).

The executive powers of Ghana are vested on the President in accordance with the provisions of the constitution as captured in Article 58 (1) (Republic of Ghana 2005: 45). The Vice President of Ghana shall perform functions assigned to him/her by the Constitution or President of the Republic in Article 60 (1) (Republic of Ghana 1992, 2005: 46). The 1992 Constitution made provisions on the composition of cabinet and person(s) who qualify to chair cabinet meetings. Article 77 stated (1) "the Cabinet shall be summoned by the President who shall preside at all its meetings; and in the absence of the President, the Vice President shall preside" (Republic of Ghana 1992, 2005: 56). It is important to note that the cabinet plays a very crucial role in the initiation of most public policies in Ghana.

The 1992 Constitution of Ghana made provision for a unicameral legislature. There is one House of Representatives (Parliament). The Constitution empowered parliament to make laws. Article 106 stated (1) "the power of Parliament to make laws shall be exercised by bills passed by Parliament and assent to by the President" (Republic of Ghana 1992, 2005: 72).

## Features of the National Democratic Congress Government

The National Democratic Congress (NDC) led by Jerry John Rawlings won the first general election held on December 7, 1992, with 58.3%, and the main opposition party New Patriotic Party (NPP) led by Prof. Adu Boahen had 30.4% (Gocking 2005: 211). This represents the "first NDC government." For the purpose of analysis, the "first" NDC government refers to 1993–1996, which also refers to the "closed" NDC government. It is called the "closed" NDC government due to the less participation of the citizenry and opposition parties to public policy processes. The main opposition party (NPP) "challenged the validity of the election in a publication entitled *The Stolen Verdict*" (Gocking 2005: 211). Due to those accusations of rigging, all opposition parties boycotted the parliamentary elections. Out of the 200 seats in parliament, the NDC won 189 seats, National Convention Party (NCP) pro-NDC won 8 seats; EGLE Party (pro-NDC) won 1 seat, and 2 women independent candidates were elected (Gocking 2005). Gocking (2005) indicates that the role of opposition in shaping public policies of the first NDC government was absent.

Some editors and journalists who were critical of the government were arrested. This era was known in local parlance as "culture of silence" in action. The provision that in the absence of the President of the Republic, the Vice President presides over the cabinet meeting was not much observed. The opposition members perceived the first NDC government as "military in civilian coats."

### The Economic Conditions Under the First NDC Government

Gocking (2005) indicates that the 1994 budget experienced a shortfall in revenue as such the first NDC government resorted to borrowing internally from local banks as well as externally. The NDC government was highly indebted from $3.5 billion in 1990 to over $5 billion in 1994. Moreover, the NDC government "overall tax revenue was 14% lower than it had been in the three previous years" (Gocking 2005: 221). It is on

these that the NDC government associated the problem of lower tax revenue to the existing narrow base tax system. Thus, the first NDC government decided to broaden the tax based on introducing the indirect tax system known as value-added tax (VAT) where "17.5% that was to be levied on service and retail transactions excluding education, health, foodstuffs, financial services and some categories of equipment" (Gocking 2005: 221; Osei 2000).

## The Policymaking Stage of the VAT

The government as part of the policymaking process established a project office in October 1992 to be "responsible for the design and implementation of a new tax system to replace the Sales Tax regime which has been in existence since 1965" (Attafuah 2001: 40). A feasibility study was conducted by a technical committee under the supervisory of UK-based consultants Crown Agents and Harvard Institute for International Development (HIID) on how to design VAT to ensure its successful implementation. It is important to note that this stage was confined to foreign experts or consultants. The Ghanaian public knew very little about VAT until it was sent to parliament for consideration. It was passed in Parliament in November 1994 under Act 486. Also, VAT regulations were passed in February 1995 under Legislative Instrument (LI) No. 1598. VAT Act became effective on January 1, 1995, and actual "collection" (implementation) commenced in March 1995 (Terkper 1993, 1999; Assibey-Mensah 1999; Attafuah 2001).

## The Implementation Stage of the VAT

The NDC government vested the powers to determine the percentage of VAT on the Minister of Finance. This arrangement was contrary to the 1992 Constitution. Article 174 (1) stated that "no taxation shall be imposed otherwise than by or under the authority of an Act of Parliament" (Republic of Ghana 2005: 105). This first arrangement introduces a flaw right from the policy formulation stage of the VAT. The flaw was detected by the Honorable Members of Parliament which generated a heated debate in Parliament. But the majority had their way, and the minority in Parliament only had their say; this has been the parliamentary culture or practice in Ghana. In a one-party dominated parliament, the voice of opposition was quite low between 1993 and 1996.

As part of the implementation stage of VAT, there were clear rules for businesses who intend to implement the policy. One such rule was that any business or trade firm with an annual turnover of 25 million Ghanaian cedis (10,000 pounds sterling equivalent by then) was required to register and operate the new tax system (VAT). In addition, persons and companies qualified to register but failed to do so can be prosecuted in accordance with the Legislative Instrument (1598). Moreover, operators of VAT must file their monthly returns at VAT offices, and the accounting period is 1 month without fail. Certain items were exempted from VAT according to schedule 1 of the VAT Act 486 (Attafuah 2001: 48–49).

One implementation strategy put in place was the establishment of an agency to facilitate the implementation of VAT. In this regard, the NDC government established the value-added tax service (VATS) in 1994 as an independent state revenue collecting agency in Ghana. The functions of VATS for implementation of VAT include to collect taxes, account for taxes, and ensure that penalties and interests are payable. The VATS was headed by a commissioner and assisted by deputy commissioners. Also, VATS had a board with the mandate to provide policy directions for the implementation of VAT (Attafuah 2001: 49–50). It is expected that this institutional structure would facilitate the implementation process of VAT in the 1990s. However, the public policy (VAT) implementation process was deviled with many challenges.

## The Implementation Challenges of VAT in Ghana

The VAT was faced with serious challenges, especially at the implementation stage. Attafuah

indicates "barely a month after its introduction, prices of goods and services shot up" (Attafuah 2001: 49–50). Organized labor unions, businessmen and businesswomen, and the Ghanaian public protested seriously against the introduction/commencement of VAT on March 1, 1995 (Assibey-Mensah 1999; Terkper 1999; Osei 2000). These protests or contestations were to show their disapproval for the first introduction/commencement or implementation of VAT in Ghana in 1995. There were a number of reasons for those protests in the country. One, the agenda-setting was so secretive that the general public had little knowledge about VAT. Network groups such as nongovernmental organizations and other groups could not make inputs into the VAT policy. Even top civil servants who could have given government officials some pieces of advice were not part of the various stages except the top trusted "revolutionary cadres." Also, the mass media played a minimal role concerning the publicity of the VAT. The NDC government cabinet was divided; President J. J. Rawlings was at loggerhead with Vice President K. N. Arkaah (leader of the party with eight seats that formed a coalition with NDC known as "Progressive Alliance"). The NDC government was divided over the introduction of the VAT. According to Attafuah "the Vice President in his May Day address on 1st May 1995 called for the withdrawal of VAT." These developments brought more protests in Ghana over the implementation of the VAT (Attafuah 2001).

Apart from the street protest by labor unions and various business groups, there was a massive demonstration in May 1995 against the NDC government organized by a pressure group known as *Alliance for Change (AFC)* in Kumasi. The demonstration was termed "Kume Preku" in the Akan language meaning "kill me instantly." This mammoth demonstration ("Kume Preku") "led to the death of four people and others sustained various injuries, who were allegedly shot by the Association of Committee for the Defense of the Revolution (ACDR), a pro-government body" (Attafuah 2001: 51; Osei 2000: 255). The demonstration mounted serious pressure on the NDC government to review the policy. This evidence proved there was a lack of acceptability of the public policy (VAT) by the Ghanaian public due to its content and design.

Another implementation challenge was in relation to NDC government intolerance for media pluralism. The failure of the NDC government to educate the public (taxpayers) before passing VAT Bill into law was a mistake. Also, it was a wrong approach for policymakers to introduce a public policy (VAT) before intensifying public campaign to support it. Therefore, inadequate public education on the VAT coupled with the deceit from government officials hindered the implementation of VAT in Ghana at the first phase of its introduction (March–June 1995).

Another challenge of VAT was its design. Certain items like Gari (local food from cassava) that were exempted from sales tax (previous tax) were included as taxable items under VAT (Attafuah 2001: 55–56). Also, goods that were exempted under Ghana Investment Promotion Act (a previous tax) came under VAT. The Ministry of Health failed to provide the list of "essential drugs," so the Ghanaian public "was at the mercy of pharmacists" who could increase the prices of drugs, whether they were essential drugs or not (Assibey-Mensah 1999; Terkper 1999; Osei 2000; Attafuah 2001: 54).

Also, the NDC government adopted a "top-down" implementation approach where Ghanaian public was not deeply involved in the agenda-setting, policy formulation, and policy decision-making. It was only the implementation stage that involved the general public, and this approach did not help. At the implementation stage, the bottom (Ghanaian public) frustrated the top (political elites). Thus, the top-down approach alienated the general public and other key policy actors.

The Ghanaian public discontent continued against the NDC government over VAT. Finally, in June 1995, the NDC government decided to withdraw VAT after implementation for only 3 and a half months (Terkper 1999; Attafuah 2001). VAT was withdrawn completely in 1995, and the NDC government never attempted VAT in 1996 because it was an election year.

It may be interesting for one to ask if *there are any consequences for the withdrawal of VAT in*

*the first phase*. This paper attempts to address this question.

## A New Political Environment and the Reintroduction of VAT in Ghana

The failure of VAT in the first phase (1995) has three main consequences: it was a serious policy setback, it put government financial plans into disarray, and it was a test case of making the NDC government more accountable to the Ghanaian public (Osei 2000: 256). The country experienced a new political environment with a new parliament. In 1996 there was competitive election involving the incumbent NDC and all opposition parties. The composition of 200 seats won by the political parties: National Democratic Congress (NDC), 131; New Patriotic Party (NPP), 62; People's Convention Party (PCP), 5; People's National Convention (PNC), 1; and vacant seat, 1 (Republic of Ghana 1996). This period means a new NDC government (winner of a competitive election) and a new Parliament emerged in 1997 (as a multiparty parliament).

The content of VAT was reviewed by the new NDC government. The VAT was well designed by policy experts and several networks and brought back to parliament for consideration. The VAT bill was debated to remove the mess by the vibrant opposition and the incumbent NDC parliamentarians. Once the policy content selection of goals and means as the design of VAT were right, it did not face any difficulty in the new Parliament with a strong opposition to debate VAT. The reintroduced VAT bill was passed into law in February 1998 under a new VAT Act (Act 546) by Parliament of Ghana. The President of Ghana assented to VAT on March 18, 1998; it received gazette notification on the same day with the Legislative Instrument (LI 1646). The new VAT legislation came into effect on December 30, 1998 (Terkper 1999; Osei 2000).

*Are there any lessons for policymaking and implementation of the reintroduced VAT?*

One lesson was it pegged VAT rate at 10% against 17% of the first VAT. Also, those operating the old tax regimes such as sales tax and service tax "were deemed to be liable for registration" of the VAT to ensure continuity against the first VAT which did not make provision for operators of previous tax systems (Osei 2000: 272). Finally, a new VAT service was established with nine board members and responsible to the Ministry of Finance and Parliament of Ghana against the first VAT where the VATS (secretariat) and board members were autonomous. Another lesson was VAT had more policy actors such as elected politicians, appointed officials, media, various political parties, and active civil society groups to review its content and design.

Another question pose is: *what factors precipitated the reintroduction of VAT in 1998?*

The new NDC government identified inflow of foreign aids as its main source of revenue for development, and if the levels of inflow of foreign aid declines or ceases to flow into Ghana, it would signal that "the long-term sustainable development of the country would be jeopardized if aid levels declined sharply" (Osei 2000: 272). The new NDC government sought for local ways of sustaining its national budget and to reduce aid dependency through the reintroduction of the VAT. Moreover, the government was determined to succeed in the VAT system since many other African countries succeeded in the enactment and implementation of the VAT. Uganda was cited as one African country which successfully replaced its sales tax with VAT in 1996 (Osei 2000). In the same year other African countries followed with VAT, these countries include Botswana, Swaziland, and Malawi. Osei indicated that even Ghana's neighboring country to the West, Cote d' Ivoire, adopted VAT and others such as Nigeria, Mali, Niger, Kenya, Madagascar, and Benin "adopted VAT system without any serious political fallout" (Osei 2000: 258).

Another question addressed is: *If VAT succeeded in other African countries and increased their revenue base, does it mean it must necessarily succeed in Ghana?*

The political culture of Ghana is not the same as the other African countries. Also, the role of civil society groups and other factors differs from one African country to another. The NDC government's decision to copy tax reforms from other

countries should have taken other factors into consideration to avoid wrong copying. Also, there was a need to study policy transfer dynamics well before the adoption of the first VAT.

## Study Implications and Recommendations to Public Policymakers

The first NDC government needed to have created a public trust and involve Ghanaians through their representatives in Parliament and utilized media houses. The early stages of policy cycle (agenda setting, policymaking, and formulation) should not have been secret but should have been open for public discussions through media houses, schools, universities, policy actors, and engagement of opposition groups. If the NDC government had intensified the public campaign to educate the people on the aims of the VAT and its operations, the challenges VAT faced in 1995 would not have come. The reason was that Ghanaians would have known VAT was for their good and would have accepted it rather than rejection. The first NDC government was also divided on VAT, and that affected its acceptability, the adage "a divided house cannot stand."

Another way that could have helped tackle numerous challenges of VAT was to have adopted a mixed approach to policy implementation. The mixed approach also is known as the "synthesizer" approach which utilizes the strengths and weaknesses of top-down and bottom-up approaches to policy implementation (Winter 1990; Hill and Hupe 2009; Howlett et al. 2009). Top-down approach involves the perspectives of policy elites (top politicians, public officials), while "bottom-up" approach involves the views and lower-level officials or actors like frontline workers/street-level bureaucrats and other policy actors at the local level. It was not advisable to have adopted bottom-up approach because the political system or political culture was not ripe for it. Also, confining VAT to the top elites (political/administrators) alone was inappropriate (top-down). The best implementation strategy should have been the "mixed approach" involving top NDC elites, top public officials, and local-level policy actors/stakeholders. Thus, the mixed approach would have been more effective and appropriate to enhance the implementation of the VAT. This agrees with Winter's argument that to enhance policy success, the "interests of the various actors who have a stake in the implementation process" must be involved (Winter 1990: 22–23).

Moreover, the content and the policy design of VAT were not clear. Policy goals and the means (instruments or tools) for achieving the policy goals were not clear and adequate. An ineffective and flawed policy design factors such as poor resources (including financial and human), goals, and intermediaries (public and private implementing agencies) can affect the implementation process which may result negatively (May 2012; Winter 2012; Vancoppenolle et al. 2015).

The empirical evidence support that the policymakers were divided on the percentage of a VAT charge on goods. These developments did not make the policy attractive as the Ghanaian public was suspicious of the real intentions or motives of the NDC government on VAT. The findings support Winter's theoretical arguments that policy implementation is often affected by prior policy formulation process (policy design elements) such as conflicts and unclear goals and means, as these elements affect policy implementation results – output and outcome (Winter 2012). It was found that these policy design elements or factors inhibited the implementation of VAT in 1995. This finding concurs with May (2012) that a faulty policy design instruments (poor mix of the instruments) affect the policy implementation success. It was also found that the people were alienated from the design, formulation, and decision-making processes, and that affected VAT implementation in 1995. This result is consistent with Howlett et al.'s (2009) study outcome.

The key recommendation is that public policymakers need to be mindful of their policy goals and the means of achieving the goals. The content or substance of the policy must be clear to avoid misunderstanding, misinterpretation, or ambiguity of policy goals/means (May 2012). Another way that could have minimized the numerous challenges of VAT in a "closed" NDC

government was for political tolerance on divergence views, especially from opposition groups. Also, to respect 1992 Constitution that guarantees the right of associations, right to demonstrate, freedom of speech, media plurality, among others. There was the need for the NDC government to have opened up or shifted from the secrecy of policymaking to pave way for "citizen participation" (Kpessa 2011) with emphasis on openness on both policymaking and implementation.

It seems that most developing countries rely heavily on experts from the developed world. There is nothing wrong with consulting experts from developed countries, but what developing countries' governments need to be mindful of is on which consultants to invite for policy matters is crucial. Moreover, developing countries need to know that vast differences exist between developed and developing countries. When a public policy worked in a developed country environment, it does not necessarily mean it may work in a developing country context. It does not also mean a policy that was successful in one African country will necessarily work in another African country. Thus, policymakers need to study "policy transfers" very well before adoption. Developing countries should study local contexts or conditions in identifying factors that promote or inhibit policy implementation. Thomas and Grindle (1990) mentioned the policy failure of the Busia government in Ghana when it relied so much on the advice of the Harvard Institute for International Development (HIID) for the devaluation of the Ghanaian currency by 44% in 1971 (Thomas and Grindle 1990). The experts' advice on the devaluation of Ghana's local currency was a "political suicide." It contributed to the overthrown of Busia government in 1972. Unfortunately, the NDC government failed to learn a lesson from Ghana's past experience on policy failures. There is the adage that "he who fails to learn from the past is bound to repeat the mistakes of the past." I, therefore, suggest policymakers in Ghana and other developing countries to learn from the experience of similar policies in their countries or elsewhere to avoid making public policy blunders.

## Conclusion

It is advisable for democratic governments should keep to their democratic tenets. Allow freedom of the press and association. Allow network governance to be a driving force in policymaking processes in order to come with good and acceptable public policies. Ghana's second VAT in 1998 was successful because of the good governance structures then, media freedom, tolerance for opposition, and active civil society networks, etc. These are vital for governments and political regimes to uphold their constitutions to boast policymaking processes to enhance policy implementation at national and local levels. In conclusion while the "closed" NDC government (1993–1996) relied so much on its top elites with so much secrecy of the policymaking process, the "open" NDC government (1997–2000) shifted to "citizen participation" (Kpessa 2011) with more openness, policy actors, opposition groups, civil society groups, as well as the deep involvement of the people (citizens). This contributed to VAT successful implementation in 1998. Thus, an open political system matters a lot in both the public policymaking and the implementation processes, not only in Ghana but in other developing countries.

## Synonyms

Corruption; Failed leadership; Politics without principles

## Definitions

**Politics without principles** Gandhi submitted that "*when politicians (or anyone else, for that matter) give up the pursuit of truth, they, or in the case of parties, would be doomed.*"

**Socioeconomic development** Socioeconomic development refers to the social and economic indicators such as health, education, gross domestic product (GDP), foreign direct investment (FDI), technology, and life expectancy rates which are linked to the development of the society (Sewell et al. 2017).

## Introduction

Among the seven deadly social sins proposed by Mahatma Gandhi is ***politics without principles*** (Gandhi and Gunsky 1990). Politics without principles emerged during the twentieth century in one of Gandhi's weekly newspaper publications called the *Young India* in 1925 (Gandhi 1939). It has been a striking description of what occurred in sometime past and is recently reoccurring in some developed and developing countries. Politics is everywhere though some scholars do not agree to this assertion. Politics can be experienced in almost every facet of the human life. It is in the church, mosque, sports, government, and *"politics is even in the bedroom."* Aristotle argued that, it is within the political society that one can achieve his or her potentials (O'Toole 2005). Politics is defined as the struggle for power that will give one or more person(s) the opportunity to make decisions for group of people (Young 2011). Politics can also be referred to as the process through which people make, preserve, and amend the general rules under which they live (Heywood 2002, p. 4).

The impact of politics on the society from the ancient, medieval, and recent times has been massive and for that reason cannot be taken for

granted. Nevertheless, Jordan and Van Tuijl (2006) among other scholars have argued that politics must be linked to principles in order to have a peaceful and a developed society. Politics without principle is therefore a recipe for chaos. Mahatma Gandhi argued that politics without principles was one of the root causes of corruption, violence, and other evils in the society. To create an enabling environment for peace, growth, and sustainable development, Gandhi advocated for politics with principles. Concerning politics with principle, Gandhi asserted, "it is *the expression of perfection, and as imperfect beings like us cannot practice perfection, we device every moment limits of its compromise in practic*e" (Gandhi and Gunsky 1990, p. 10).

The seven social sins which are also known as the seven blunders that the society commits according to Gandhi is the cause of violence and evils in the society. The seven social sins are politics without principles, wealth without work, pleasure without conscience, knowledge without character, commerce without morality, science without humanity, and worship without sacrifice (Gandhi and Gunsky 1990).

Some scholars have indicated that Gandhi's seven social sins might have originated from Pope Gregory I in AD 590 in his list of the seven deadly sins. They are lust, gluttony, greed, sloth, wrath, envy, and pride. These seven deadly sins by Pope Gregory I was appropriate for him because he realized it was as a way to keep the flock from straying into the thorny fields of ungodliness. Though in recent times for all but the most devout, Pope Gregory's list seems less like a means to moral behavior than a description of cable TV programming (Gandhi 1939).

The list of social sins to which politics without principles is linked to sprung from a correspondence that Gandhi had with someone who was only identified as a "*fair friend*." Though major commentary was not passed on this, Gandhi wanted readers not just to know the social sins through intellect but also through the heart (Seligman 2004). The social sins by Gandhi emphasized on the conduct of people in the society. It focused on how the behavior of people in the society will bring about development and peace.

Each of these social sins by Gandhi exhibited selfishness winning out over the common good of the society. These social sins if fully observed and practiced by individuals in the society will make those who have wealth without work to work harder to yield their investment. It will also help those who are into commerce without morality to have good morals, those with knowledge without character will also build characters. It will further place a demand on people in politics or in charge of state resources to discharge their duties with high ethical principles.

This entry focuses on one of Gandhi's social sins; politics without principle which gained prominence in the twentieth century. Regarding politics without principle, Gandhi asserted, having politics without principle is doing politics without truth, politics of lies, deceit, politics of insults, propaganda, corruption, bribery among others. These actions according to Gandhi create chaos, fuels the violence of crime, rebellion, and war (Gandhi and Gunsky 1990).

Nevertheless, researchers (Boucekkine et al. 2016) have argued that a politics may be of principle or not based on the type of political regime. There are several regime types, monarchy, dictatorship, aristocracy, oligarchy, and democracy. With these political regimes, Boucekkine et al. (2016) have argued that the autocracy and democratic regimes normally determine how the other political regimes interact. Due to the nature and variations of political regimes among states, it can be established that what may be of principle in one political regime may be otherwise in a different regime. In view of this, scholars have argued that the issue of principle in relation to political regimes is open to greater interpretation and hence appears subjective (van der Sloot 2017).

This study attempts to examine based on classic and contemporary literature the politics without principles in developing countries especially Ghana. The main focus of this entry is to unpack how politics without principles have impacted the socioeconomic development of Ghana and other African countries. The decision to examine this issue stems from the fact that most state officials especially in the developed and developing countries sometime are unethically principled in

discharging their duties and in the distribution of resources (Rosenberg et al. 2018). The political responsibility and accountability approaches are used in this study to clarify how politics without principles has impacted the socioeconomic development of Ghana.

This entry begins with a discussion of the theoretical approach that can help unravel the impact of politics without principles on the socioeconomic development of Ghana. Literature on politics without principles and socioeconomic development are reviewed. The study concludes by analyzing how politics without principles have impacted the socioeconomic development of Ghana and discusses the approaches that can help achieve political responsibility and accountability.

## The Political Responsibility Approach

Political responsibilities are inherent in the activities of individuals and organizations (Lau et al. 2018). Individuals and organizations become responsible through their day-to-day activities. Individuals become responsible citizens when they act according to the laws of the land, respect the constitution, and show basic civility. By exercising their discretion, individuals can also become responsible (Akosa and Asare 2017). However, when individuals act contrary to the laws, lack basic civility, lack respect of the laws, it does not promote good governance; this is known in this study as politics without principles.

Political responsibility is a normative concept (Coeckelbergh 2016); it refers to the commitment that individuals and organizations embrace in their quest to maintain democratic principles.

The main argument underpinning this theory of political responsibility according to Young (2011) is that individuals or organizations who are part of all sorts of irresponsible and harmful things as a result of indifference, sloppiness, malice, selfishness, or self-righteousness should be held responsible. When Young (2011) was contributing to responsibility and global justice, he asserted that, when applying the concept of responsibility, there must be clear rules of evidence.

Responsibility is normally assigned to a particular agent or individual when it is shown that their actions are connected to the outcome for which responsibility is assigned. It is important to note that responsibility can be assigned to an individual, corporation, or a government (Young 2011).

The political responsibility approach is relevant for holding individuals and organizations accountable for their actions and inactions.

Esquith (2013) argues that political responsibility calls for individuals and organizations to devotion in matters relating to humanitarian development in the society. Political responsibility refers to what politicians and public office holders are obliged to in ensuring development in the society. Thus, their duties in ensuring the rule of law and making sure the right things are done make them politically responsible. Those who are able to operate these ways bring about positive political responsibility (Esquith 2013).

The political responsibility framework which is adopted in this study is appropriate because it would help identify, control, and deal with individuals or organizations that act without principles. Political responsibility creates good governance and brings about socioeconomic development in the society. Nevertheless, there are state officials who are politically irresponsible. Gandhi referred to such officials as politicians who operate without principles. Officials with negative political responsibility really provide great disservice to their country.

## The Political Accountability Approach

Contributing to the literature of political responsibility, Bovens (2007) attempted to link political responsibility to accountability. Przeworski and Stokes (1999) have argued that when the issue of accountability is raised scholars normally refer to the accountability of bureaucrats to the general public or the society. However, researchers in public administration have revealed several forms or approaches to accountability and responsibility. According to Bovens (2007), one of the approaches to accountability is political accountability. Political accountability focuses on elected

representatives, political parties, voters, and the media. Political accountability is mostly practiced in democracies where voters delegate their sovereignty to popular representatives in parliamentary democracies.

Another approach of accountability is legal accountability. This form of accountability is of increasing importance to public institutions as a result of growing formalization of social institutions or due to the trust that is placed in courts. Legal accountability is usually based on specific responsibilities, formally or informally conferred on authorities. Scholars have argued that legal accountability is the most unambiguous approach to accountability because the legal scrutiny is based on detailed legal standards, prescribed by administrative status or precedent (Przeworski and Stokes 1999).

Moreover, administrative accountability is one of the accountability types Bovens (2007) indicated in his literature. There are quasi-legal forums that exercise independent and external administrative supervision and financial control. Administrative accountability inspects, supervises, checks frauds, and ensures regular and administrative scrutiny on the basis of specific statutes and prescribed norms (Friedman 1985).

Other forms of accountability as revealed by Bovens (2007) are professional accountability, social accountability, corporate accountability, hierarchical accountability, collective accountability, individual accountability, and social accountability.

Recently, Christie (2017) has argued in the public administration literature that various accountability frameworks or approaches exist in explaining accountability. Christie (2017) has indicated that different kinds of accountability and responsibility produce different types of decisions in government. Similar to the work of Bovens (2007), different types of accountability like moral/ethical and social accountability are indicated in the literature of Christie (2017).

## Politics Without Principles

Gandhi submitted that when politicians (or anyone else, for that matter) give up the pursuit of truth, they, or in the case of parties, would be doomed. Partisan politics, lobbying, bribery, and other forms of malpractices are all considered "*politics without principle*" (Gandhi 1939). They are unprincipled. Politics without principles exist when powerful lobby groups are created for the cause of politicians to do anything to achieve their goals.

It must be noted that even in the 21st century these "unprincipled" practices appear so rampant in politics. Politics has earned the reputation of being dirty and this is so because individuals in have made it dirty. People sometimes create power groups to lobby for their personal interests and are willing to do anything to achieve their goal. Not many among human kind have learned how to resist temptation, so who is to blame for the mess we find ourselves in?

Gandhi posits that, "*When politicians indulge in power games, they act without principles*." An example is to remain in power at all cost. Especially in the developing countries like most African countries, some elected leaders whose terms of office are due are not willing to step down or go for reelection. Those who accept reelection also use dubious means and methodologies to win elections. These according to Lasswell and Kaplan (2013) are unethical.

Within the context of Ghana, there have been several instances where individuals and public officials have conducted themselves in a manner which leaves little to be desired. Some of these public officials have compromised on their ethical principles, compromised on their values, and engaged in politics without principles. For example, Joy News reported in April 26, 2016, that "a brand new Ford Expedition *with engine No. E173A1905101 and Chassis No. 1FMJUIJ58AEB748 was presented as a gift to the President of Ghana by a* Burkinabe contractor in 2012. The said Ford Expedition entered Ghana on October 29, 2012. It was within this same year that the Burkinabe Contractor was awarded two contracts by the Government of Ghana. The contracts were the $650,000 Ghana Embassy Fence Wall and Dodo Pepeso-Nkwanta road worth €25.9million after several failed attempts by the same person to win a contract"

(Joy News 2016). From the report, it was observed that a gift was presented to win contract. This action and many other unprincipled cases have occurred in Ghana and many other African countries. Also, activities by individuals in high positions do not only affect the smooth running of the country but also contribute to huge sum of revenue loss to the state. This hinders the government's quest to provide public goods, hinders development, and increase poverty.

A study by Campbell (1993) has shown that politics without principle is not only linked to Africa or the developing countries. There are politics without principles in the developed countries also. Campbell (1993) related the politics without principles in the developed countries to the war options or defense strategies that are adopted by some developed countries. For example, the stand and support by the USA in the invasion of Kuwait according to Wallerstein (2002) were too aggressive and biased. In Michael Gordon and Trainor's view on the Kuwait invasion, they submitted: "*it was more like a one-sided clay pigeon shoot than armored battle*" (Gordon and Trainor 1995). Though other writers disagreed with the invasion of Kuwait by Iraq, however, the stand by the USA appeared one-sided and aggressive. These actions by the USA in relation to the Kuwait invasion, according to Miller (2008), seemed unprincipled and not healthy in international politics.

It is important to establish that, some of the developed countries have threatened the developing countries by stressing they would reduce or stop giving them aid if they do not accept or support their policies. For example, the US President threatened to cut aid to countries over the UN Jerusalem vote (BBC News 2017). It appears the aids given to the less developed countries are done so that the less developed countries would support the powerful countries. Moreover, in the developed countries just like some developing countries, issues of subtle racism, religious discrimination, and bigotry abound.

## Principle Defined

Principle refers to a comprehensive and fundamental law, code of conduct, doctrine, or assumption (Proper and Greefhorst 2010). Principles are fundamental norms, rules, or values that represent what is desirable and positive for a person, group, organization, or community and helps in determining the rightfulness or wrongfulness of its actions (Proper and Greefhorst 2010).

Gandhi defined principle as "*the expression of perfection, and as imperfect beings like us cannot practice perfection, we device every moment limits of its compromise in practic*e" (Gandhi 1939, p. 78).

Principles are more basic than policy and objectives and are meant to govern both. It is important to note that principles are used as a basis for prediction and action. This implies that principle regulates the actions and inactions of individuals, groups, organizations, and nations. Principles define what is right and wrong (Mackie 1990).

Perkins (2002) has indicated that there is an international human right law that protects freedom of the press, provides cross-culturally reliable foundation through which there is the universal principle when it comes to ethics in journalism. It has been deduced from Perkins (2002) perspective of principle that every sector or area has it principle that it operates. In the area of medical science, they have their principle; economics, there is principle; and politics, there is principle. There is principle in everything we do in the world. Without principle, the foundation of what is meant to exist collapse.

With regards to principle and in the context of politics, Herbert (1880) has argued that "*politics must be based on general principles grounded in an understanding of human nature*" (p. 1). Since politics is part of the human race, it must be based on principles. However, *the word principle* causes some sort of horror to the people who are indulging in politics. It must be observed that principles in politics will bring an idle way of thinking. Herbert (1880) has indicated that those who object to general principles in politics and renounce their supremacy are betrayed by the incautious caution. The universal law cannot be disregarded without injury to every part of humanity. Principles are, however, a truer approach in regulating politics and the development of the society.

## Socioeconomic Development

Socioeconomic development is concerned with the social and economic development in the society. The pivot surrounding socioeconomic development lies in low levels of per-capita income and low standards of living (Dastjerdi and Isfahani 2011). It must be noted that the concept of socioeconomic development refers to the social and economic indicators such as health, education, gross domestic product (GDP), foreign direct investment FDI, technology, and life expectancy rates which are linked to the development of the society (Sewell et al. 2017).

It has been stated in literature that activities like tourism has contributed to the socioeconomic development in Kenya. In Kenya, tourism has contributed to the socioeconomic development both at the local and national level. The research by Sewell et al. (2017) has indicated that the use of balance score card by retailers in South Africa is generating sustainable profitability as well as contributing to the socioeconomic development of South Africa.

## Analysis and Discussions

### How Politics Without Principles Have Impacted the Socioeconomic Development of Ghana and Africa

There are other key politics without principles variables (racism, lobbying, power games among others) that could be used to explain the socioeconomic development of Ghana and other African countries. Nevertheless, the analysis of this study was hinged on two crucial politics without principles variables: corruption and failure of leadership.

### How Corruption Has Affected the Socioeconomic Development of Ghana and Africa

Studies and other scientific reports like the Transparency International Global Corruption Report have shown that political leaders and other public officers in Africa and other developing countries in the world have engaged in one form of corruption or the other (Andersson and Heywood 2009). This kind of practice by politicians is what Gandhi has indicated as *politics without principle*. Corruption is undoubtedly the present social menace in Ghana and other African countries. Recently in Ghana, an investigative journalist revealed how some politicians and individuals who hold public offices were found in the act of corruption.

Box 1 shows a case of a corrupt activity that was exposed by Anas Aremeyaw Anas in the Ghana Judicial Service. This was reported by Citifm (one of the renowned radio stations in Ghana) in 2015.

**Box 1 Anas Descends on Judges in "Stinking" Corruption Scandal**

On 8 September 2015, ace investigative journalist Anas Aremeyaw Anas exposed some corrupt activities within Ghana's judicial arm of Government. The video points fingers at very notable judges who have been involved in high profile cases in the country in a damning corruption scandal. A total of 34 judges were caught on camera receiving bribes while others were involved in other corruption-related activities to influence judgment. The high profile judges including, Justice John Ajet-Nassam, a High Court Judge, who freed Alfred Agbesi Woyome in the controversial GHC51 million judgment debt scandal, have been videotaped and audio recorded in separate conversations with suspects or persons acting as agents of suspects before them to compromise big cases. A Human Rights Court judge Kofi Essel Mensah, Charles Quist (a High Court Judge) allegedly making demands to throw away cases which include robbery, murder, and corruption among others.

Source: Citi News (2015). http://citifmonline.com/2015/09/08/anas-descends-on-judges-in-stinking-corruption-scandal-trailer/

Judges who are expected to be an example to the people with regards to integrity and to administer justice were rather caught on camera receiving bribes according to the case above. This is unethical and dangerous to the society. The case

of bribery and corruption is very common in Africa and other developing countries.

It is important to establish that corruption exist in all political jurisdiction globally, however, it is believed to be more evident in transitional democracies particularly African countries. Due to the extent of corruption in African countries as in the case of Ghana, public administration practitioners and other scholars have indicated that corruption has negatively affected the socioeconomic development of Ghana and other African countries (Yeboah-Assiamah et al. 2014).

The cases and magnitude of corruption marveled some scholars in Africa to the extent of them admitting that "*corruption is here, corruption is there, corruption is everywhere*" (Yeboah-Assiamah et al. 2014).

One of the negative effects of bribery and corruption on the socioeconomic development of Ghana is that it brings high prices of goods and services on Ghanaian consumers. When entrepreneurs and businessmen pay bribes to politicians or public office holders, it is viewed by the businessmen as part of the cost of doing business and they transfer it unto the people which lead to high cost of goods and services in the country.

For instance, when a businessman goes to the Tema Habour to take delivery of goods, it has been reported that all kinds of bribes are taken by the officials. However, these bribes that are paid may be tacked onto the final prices of goods and services to the public.

More importantly, Ghana and other African countries lose several billions of dollars to corruption annually (Musila and Sigué 2010). According to IMANI Ghana (an influential think tank in Ghana in the fight against corruption), Ghana loses about $3 billion annually on corruption. The $3 billion stated by the IMANI Ghana was linked to Ghana Auditor General's annual report (IMANI Ghana 2016). Box 2 gives details of the report by IMANI Ghana.

**Box 2 Ghana loses $3 billion annually in corruption: IMANI**

Mr. Cudjoe, the director of Imani Ghana, a pressure group and a policy think tank, on 15 May 2016 indicated that Ghana loses about $3 billion annually. This comment was based on analysis of the 2014 Auditor General's report. He cited that corruption in state institutions is taking a toll on the economy and must be checked. He stated that "...My estimation about grand corruption in this country looking at the numbers from the Auditor General's report on an annual basis and doing an extrapolation looks to me about $3 billion a year. I think it may be conservative but I think it is significant." The Auditor-General, Richard Quartei Quartey, in his 2014 report recommended the prosecution of various officials of Metropolitan, Municipal, and District Assemblies (MMDAs) indicted in the report for various financial and legal infractions. Whereas just 195 out of the 216 assemblies submitted their books for auditing, 21 assemblies failed to comply with the legal requirement.

Several public institutions were also cited in the report for various financial malfeasance. The report also cited the Public Utilities Regulatory Commission (PURC) for blowing GH¢c99, 663 on the distribution of Christmas hampers. The report also stated that the Ghana Railway Company Limited is said to be struggling to trace an amount of GH¢25, 404 belonging to the company. According to the report, the company received a total cash amount of GH¢3, 422,574.76 at the end of 2009, out of which GH¢3, 397,170.47 was sent to the bank "leaving a balance of GH¢ 25,404.29 which could not be traced."

Source: IMANI Ghana (2016). http://www.imaniafrica.org/

Based on the IMANI Ghana 2016 report, over $3 billion is wasted annually on corruption. These are coming from the public services of Ghana. Other public and private organizations are also reported on their act of corruption.

It has also been shown in literature that corruption has reduced the commitments from

international development actors (Grindle 2004). Corruption reduces the quick flows of aids that are used for development in the country. Ghana and other African countries like Nigeria, Cote d'Ivoire among others have benefitted immensely from aid inflows from donor agencies like IMF, USAID, and UNICEF. However, these agencies are now concerned that their support in the form of aid for sustainable development are not used for the intended purpose but end up in the hands of corrupt politicians or government. It is in this view that the US government indicated recently that corruption in Ghana is on the rise and pragmatic measures have not been taken to cure this menace.

Furthermore, politics without principles through corruption has reduced the tax revenues in Ghana. Corruption has led to the loss of tax revenue in the form of tax evasion or the improper use of discretionary tax exemptions. It was reported by the myjoyonline.com on the 24 April 2017 that a relative to the former President of Ghana owed the Ghana Revenue Authority (GRA) about 20 million Ghana cedis for some equipment the individual imported into the country and did not pay the due tax. This case and other government official's conduct of not paying tax reduces tax revenues that are intended to develop the country.

More importantly, corruption reduces foreign direct investment (FDI). The World Bank (1997) has reported that FDI may flow in the countries that are found corruptible but bribery may reduce the FDI in the country. Corruption negatively affects foreign firms in the cost of doing business. However, high levels of corruption have the tendency to risk Ghana of being marginalized in the international economy.

## Failure of Leadership and How It Has Affected the Socioeconomic Development of Ghana

In Ghana, failure of leadership has affected negatively the country's economic fortunes. The failure by government hinges on the fact that leadership in Ghana has failed in its quest to address the issues of bribery, corruption that also influence negatively the socioeconomic development of the country.

In Ghana, the Commission for Human Right and Administrative Justice (CHRAJ) Act (Act 456) was enacted in accordance with the provisions of the Fourth Republican Constitution in October 1993 to establish the Commission. Among the role of the commission is to promote integrity and decency in Ghanaian public life by investigating corruption and educating the public about its high costs and, conversely, the significant pay-offs of a relatively corrupt free society. In 2014, there was a report on the wasteful expenditure undertaken by then CHRAJ boss, which questions whether the leadership of the commission was upholding the principles it had to work with. Box 3 shows details of the CHRAJ boss case.

**Box 3 CHRAJ Boss Rent**

The Daily Graphic's investigations published on Tuesday 16 September 2014 casts a terribly bad image on the Commissioner of the Commission on Human Rights and Administrative Justice (CHRAJ), Ms. Lauretta Lamptey, and the concerned state actors. The state had spent a total of $203,500 in 37 months for her rent. This was because the CHRAJ boss lived in a $456.25 per day hotel accommodation after the US$5500 monthly rent for her apartment at the exquisite AU Village expired. Her official residence renovation at the cost of GH¢182,000 was also yet to be completed. The revelation by the Daily Graphic report raises critical issues such who is responsible for dolling out $4500.00 USD as monthly rental in lieu of official accommodation for the CHRAJ boss, and on what basis was the said amount was determined?

## Approaches in Achieving Political Responsibility and Accountability

Out of the approaches in achieving political responsibility and accountability discussed in the

literature, it can be seen that various approaches were explained to achieving political responsibility and accountability. In respect to political responsibility, Esquith (2013) indicated in the literature that there are positive political responsibility and negative political responsibility. The positive political responsibility approach ensures that the rule of law is achieved and the right things are done in the country. The positive approach to political responsibility creates good governance and this leads to socio-economic development in the country. It must be noted that in terms of the political responsibility approach that is most promising to the researcher is the positive political responsibility (Esquith 2013). It was revealed in the literature that state official with negative political responsibility are providing great disservice to the state (Neito 2009).

In the literature, several approaches to achieving political accountability were discussed. Moral/ethical and social accountability were indicated by Christie (2017) among the approaches in achieving political accountability. These approaches by Christie (2017) are seen by the researcher as the most promising because it explore the behavior for which one is morally responsible to. Being morally responsible for an act amounts to being accountable for that act. Moreover, being accountable demands being a moral interlocutor. This helps individuals to be part of the moral reasoning (Christie 2017).

Moral or ethical accountability enables an individual the ability to attend to, discuss answers to reasons for actions bearing moral weight.

Social accountability, on the other hand, measures an organizational state of being mindful of the arising social concerns and priorities of government and nongovernmental organizations. Social accountability focuses on the commitment of politicians or individuals in the society in the areas of their willingness to comply with the rules of law, complying with the development of the community and its environs (Christie 2017). More importantly, social accountability mechanisms ensure the political checks and balances, accounting and auditing systems, administrative rules and legal procedures that will help fight corruption and other malpractices which are known as politics without principles.

## Conclusion

Real politicians operate with principles. Principles hinge on laws, universal truths, timeless precepts and have determinable consequences. Politicians with principles are not partial and do not indulge in what have been discussed in this study as malpractices. This entry has explained critically the politics without principles as indicated by Gandhi in his seven deadly social sins. It has been revealed in this study the politics without principles in developed countries and the developing countries. It has been explained in the study that politics without principles affect the socioeconomic development of Ghana and other African countries through corruption and bad leadership. The various approaches to achieving political responsibility and accountability have also been explained by the researcher in the study. It has been established in this study that the most promising approaches to achieving political responsibility and accountability are positive political responsibility, moral/ethical accountability, and social accountability. These approaches discussed in the study when implemented by governments in both developed and developing countries like Ghana will help ensure politics with principles.

## Politics: Basic Concepts

Soren Jordan
Texas A&M University, College Station, TX, USA

### Synonyms

Conflict; Political science; Power; Preferences; Rationality

## Definition

Politics is the "intersection of power and conflict".

## Introduction

People disagree. At an individual level, people might disagree over how best to allocate limited resources in a state or which candidate would be best for a government. In the aggregate, people might disagree over the appropriate amount of social welfare spending and assistance by a government, or whether to go to war with an enemy state.

Understanding the nature of these conflicts is the essence of politics and political science. Given the importance of conflict and the implications any single resolution to the above situations might have on an individual (or a larger society), society ought to have a deeply developed understanding of how individuals come into conflict with one another and how that conflict gets resolved. This nuanced understanding requires, at its core, a precise set of definitions. These definitions should allow individuals not only to identify the "political" or "politics"; they should also inform the study of the concept. Offered here are some precise definitions: first of politics, then of its key concepts, as well as those parts of society that are *not* political.

## A Definition of Politics

The lineage of political science is sufficiently developed so as to make offering another original definition an unwarranted exercise. Instead, previous work should guide definitions. Warren (1999, p. 208) defines politics as the "intersection of power and conflict." This definition is useful in that it provides two key monikers to identify the political.

The first moniker of the political is that some sort of power relationship must exist between two or more individuals, groups, or objects. This power dynamic is exactly what motivates individuals to make political decisions: either to exert power over another for an advantage or to subvert an existing relationship to achieve an established goal.

The exercise of power can be obvious. For instance, parties in the House of Representatives often use their control of the Rules Committee to control the flow of debate and amendment on a bill as to push the policy content towards a certain outcome. But the power need not be so formal. Informal power relationships, like the importance informal knowledge about Congressional procedures often called "folkways," leads to senior members of Congress becoming more powerful than their junior counterparts. Both exercises of power, though, lead to political interactions.

The second moniker of the political is that two or more individuals, groups, or objects must be in conflict with one another. Politics almost never exists when individuals work towards shared goals, which is why scholars of Congress routinely exclude votes concerning post offices or Flag Day. But even the tinge of conflict – like when individuals cannot agree on who will bear the burden of organization towards achieving a shared preference – induces political behavior.

These situations – politics even with shared preferences – arise far more often than one might imagine: so much so that academics have formally defined two especially important situations. The first is a *coordination problem*. Coordination problems occur when individuals in some group (both formal, like a legislature, and informal, like a group of friends) all have similar preferences but are unwilling to make the commitment to incur the costs of organizing or to spend the time coordinating their preferences. So even in the rare situation where individuals all want the same (or very similar) outcomes, these outcomes might not be achieved because they cannot (or will not) properly coordinate.

Perhaps the best example of a coordination problem is the problem of parties in legislatures. Most members that share a party identification who have been elected to a legislature share some basic level of preferences. For instance, in the United States context, most Democrats want liberal policy, while most Republicans want

conservative policy. But even though legislators share these basic preferences, they are unwilling to spend the time and energy required to coordinate their efforts together for the purpose of creating legislating. Other considerations, like district concerns or time pressures, might keep them from acting in a unified way. The party as an overall institution can help to solve this problem, doing the legwork of gathering information about different pieces of legislation or informing the members of the party about upcoming votes. In this way, the more desirable outcome – party-favored legislation – is achieved because another institution helps to fill the gap.

The second is a *collective action problem*. These are a bit more realistic: individuals all want to benefit from the access to some resource without having to pay for the resource. These problems often occur when examining the provision of government services. Almost no one on a survey would be for lower education standards or more roads with potholes. But individuals diverge dramatically on their willingness to pay for those services. Although they themselves want to benefit, they want only others to incur the cost, often leading to situations where individuals want for tax rates to be increased on others' income and others' resources (like capital gains or cigarettes), but decreased on their own! Here too some sort of mutually preferred outcome might not be achieved, but this time much more directly because of an individual's own self-interest.

The last sentence points towards another key concept from politics: *rationality*. Rationality can be defined as a situation in which an individual has well-defined preferences regarding some outcome and then act in a way to maximize those preferences, or get an outcome as close as possible to his or her preferred one. Calling preferences "utility" – how much an individual "gets" from an outcome – political scientists formally say that rationality is when individuals are *utility maximizers*. An entire branch of the study of politics is devoted to analyzing what happens in political situations when each individual acts rationally, given his or her own preferences and the preferences of the other individuals in his or her situation. This branch of politics is *formal theory*.

Formal theory is useful in the study of politics for a multitude of reasons. The first is that it is one of the true *deductive* theories of politics. A deductive theory of politics starts from a central assumption at the "top level" and works to explain lower levels of behavior. The central assumption of formal theory is that individuals are utility maximizers. In making this assumption, political scientists say nothing of *individual politicians* or particular contexts. Instead, formal theorists can simply observe what behavior in the political world can be explained or predicted by rationality. Formal theory produces interesting predictions, like candidates converging to a moderate ideology. If individuals vote simply for the candidate in an election who is the most proximate to their own ideology, and abstention is not permitted, formal theory predicts that candidates will converge to the median voter. Formal theory also helps explain the importance of "veto players" in Congressional chambers. If two-thirds of each chamber of Congress are required to override a presidential veto, and an individual member recognizes that he or she is the "two-thirds" member (the so-called "veto-pivot"), he or she might be able to extract concessions from other lawmakers or otherwise control that outcome of legislation.

Both of these above predictions, though, rely on core assumptions that may not accurately model particular situations. For instance, the median voter theorem does not allow for abstention. It also fails to recognize the relative importance of each individual vote (like whether individuals at the extreme are more or less likely to contribute to campaigns in other ways) or the likelihood of each individual actually voting, regardless of his or her ideology (although political scientists know that moderates participate less often than ideological extremists). Some political scientists argue that this points to the importance of *inductive* theory: making scientifically useful observations about the social world and using those observations to build a theory of political behavior. The importance of both the inductive and deductive approaches, though, illustrates a

broader point: politics can be studied in a variety of ways, a point elaborated below.

## Approaches to Studying Politics

So when looking for politics, political scientists can look for instances of preferences in conflict. What remains, then, is a closer look at the individual concepts that help *organize* the study of politics. The first two concepts are relatively zero-sum dichotomies in which the researcher must make an *a priori* decision.

The first requires a decision about the types of *questions* a researcher wishes to ask. There are two basic approaches. The first considers a question about how politics is organized. A researcher can choose to ask either a *scientific* question or a *normative* question. The scientific question would include elements such as "how is a government organized?" "If X is a part of a government's organization, how does Y change?" Such questions have, at their core, a targeted goal of understanding the mechanics of preferences in conflict. Scientific questions are common in political science. One example is a set of research that seeks to understand how "clarity of responsibility" in government influences voter behavior. This research argues that in governments in which responsibility is more transparent (like when a single party maintains a majority, rather than a coalition of parties), it is easier for individual voters to trace policies back to specific politicians. In these cases, voters are more proactive at the polls, replacing those politicians whose policy actions they disagree with. This leads to more accountable government and better policy representation. The cause-and-effect story of how clarity of responsibility influences voter behavior is a scientific question.

*Normative* questions are much different. Normative questions are essentially concerned with how things *ought* to be. These would turn the previous examples on their head, instead asking "how *should* government be organized?" often with the goal of serving some population or group. Using the previous example, normative research might ask "which system of government is best for the voters?" It might conclude that governments *should* increase clarity of responsibility so that voters can make better decisions and representation can improve. Here, regardless of the causal story, the normative researcher is interested in a particular answer.

Presuming the researcher knows the kinds of questions he or she wants to ask (*scientific* or *normative*), the second dichotomy involves the researcher's own perspective when providing an *answer* to these questions. Fundamentally, an answer might involve a description of how the world works – simply describing the causal relationship of some concepts to others. This perspective is called *objectivity*: devoting less attention to the content of an answer to a question as much as the "correctness" of the answer, with a special attention to the accurate description of the causal relationships between concepts. Objective answers are unconcerned if they find that politicians purposefully use obscure policymaking methods (like complex procedural rules) to hide the responsibility for policy. Such answers are only concerned with accurately identifying the relationship.

The opposite of this objective perspective is a *critical* one. A critical perspective is concerned with illuminating the especially human aspects of the exercise of power in conflict, rather than merely describing it. Only with a critical perspective do researchers arrive at explications of the political focused on resolving alleged systematic wrongs, like Marxism. Marx was especially concerned with elaborating the relationship between capital and labor, but to simply understand the cause-and-effect. Instead, Marx wanted to inform common laborers of the way in which they were being abused and incite them to take control of the production of capital for their own benefit. Such a critical answer to this relationship between two concepts – capital and labor – is clearly meant to illuminate the power dynamic between groups.

An especially important word is in order at this point: politics and political science are sufficiently wide to permit a genuine diversity of perspectives among their practitioners. This diversity is known as *pluralism*, and usually it is recognized for its importance to the discipline.

The mere definition of politics offered here – the intersection of power and conflict – points toward the importance of asking normative questions and crafting critical answers. Those individuals in which political power is often vested are interested in the furthering of their own interests, not some collective good. And the external challenges to this exercise of power offered by the study of politics are especially well positioned to engineer change for some normative "better." But without an objective, scientific understanding of the causal relationship between variables – what resources *objectively* empower a government to do, or what electoral systems *precisely* change about voting outcomes – providing the most empowering answer to a normative question might prove difficult.

## Where Politics Often Occurs

Even understanding what constitutes the political, it is useful for the practitioner of political science to have a basic set of points of interests in which to look for the exercise of politics. Such points include when individuals engage in *voluntary* or *involuntary associations*. Voluntary associations might be much more centered around a shared set of defined preferences. Politics in voluntary associations might be a group with a set of shared preferences working to use their common influence and pooled resources to exert power over other groups. A simple example of these voluntary associations is lobbying groups. Lobbying groups depend on voluntary members and contributions to influence the policy preferences and decisions of members of a legislature. Often, this results in some final policy outcome being skewed towards the lobby's preference, rather than some mutually preferred outcome.

Involuntary associations usually evoke much more of a dynamic of preferences in conflict with a stronger power relationship. The key part of the power relationship here is that an individual does not get to choose to be a part of the association, so those in charge might be tempted to take advantage of them. A simple example here is of a government. An individual might choose to live in a country, state, county, or town, but after that choice, he or she does not get to choose to join its governments. And even without this choice, he or she is still expected to pay his or her taxes and follow the jurisdiction's rules. This might lead the politicians of those jurisdictions to take advantage of some individuals, knowing that it is extraordinarily difficult to uproot oneself and move to another place, especially for those with limited monetary resources. These involuntary associations evoke a much stronger sense of power in conflict. Both voluntary and involuntary associations are likely to induce political behavior as individuals negotiate their own preferences in competition with another.

Similarly, politics often occurs when distributing some finite amount of *resources*. Individuals might compete for the time and attention of one another, while governments might compete (often with each other) for physical or monetary resources. Given the power that resources often enable an individual to exert, and the finiteness of those resources, researchers are often drawn to situations in which resources are being distributed. In formal theory in particular, politics occurs when individuals often compete rationally to divide some finite resources or outcomes to maximize their own benefit.

The preceding paragraph alludes to one final point of interest. Politics can often occur among individuals – either single people or governments – or it can occur regarding the rules governing their interactions, when political scientists study the individuals themselves, it often ascribes a specific importance to *behavioralism*: why do actors make specific decisions? Returning a final time to Congress, a researcher might focus on the *individual* pressures a legislator feels when casting his or her vote – to vote in line with constituency, with party, and with expectations, to name a few.

But the larger environment in which individuals operate might also play a critical role. In this sense, researchers might also be interested in *institutions*: the "rules of the game" that limit the set of

behaviors and responses available to some actor. In Congress this might include how the written rules themselves (the ability to offer amendments or the technicality of certain points of order when spending Congressional money) influence the policy outcomes and alternatives available to members. Both the study of individuals and their institutional environments enrich the understanding of politics and deserve attention.

Lastly, researchers ought to note that not all things are political. Not every societal interaction involves some sort of political process: otherwise, the fields and definitions of sociology and political science would be subsumed by one another. Not all power is contested, and political scientists ought to understand those situations in which it is deferred willingly. Similarly, not all conflict is political, as actors might not hold sincere preferences over some resource in question. Politics certainly permeates the social world, but to see every societal interaction as political misses the nuance of politics: it is the union of *both* power *and* conflict. In those situations, political scientists should seek to understand what is driving that conflict and understand it.

## Conclusion

Society is interesting and exciting to study because of the very nature of the many disagreements that occur within it. Politics and political science are equally valuable because of the many approaches that they permit. Researchers are free to ask objective or normative questions, to start their theories inductively or deductively, or to examine the political between individuals or through institutions.

When truly looking for politics, researchers can readily conclude that it exists with ubiquity in the social world. Moreover, even those social interactions that one might be tempted to conclude are negative – individual disagreements, electorally biased rules, conflict over policy preferences – are beneficial in that they create the very interactions that constitute the existence and study of politics. Rarely are preferences aligned, and when they are not, it allows for the study of those basic concepts and interactions that make up the political world. A researcher should choose an approach and, with a recognition of some basic concepts in hand, enrich the study of the political world.

# Politics–Administration Dichotomy: Insight from a Developing Country

Gurmeet Singh[1], Neale Slack[2] and Shavneet Sharma[1]
[1]School of Business and Management, The University of the South Pacific, Suva, Fiji
[2]Sydney, Australia

## Synonyms

Administration; Bureaucracy; Bureaucratic politics; Politics; Politics and bureaucracy nexus; Public administration

## Brief Definitions

*Politics* – the expression of the will of the state in terms of formulating policies for control, allocation, and use of resources.

*Public administration* – the execution of the will of the state by carrying out that policy.

*Politics administration dichotomy* – is a theory that constructs boundaries between political and administrative functions and holds that political interference in administration would erode the opportunity for administrative efficiency, and that the policymaking activities of government ought to be wholly separated from the administrative functions.

## Introduction

The predominance of extant knowledge relating to the politics–administration dichotomy has almost exclusively been derived from wealthy, advanced democracies. However, in stark contrast, only scant research attention has been given to understanding this dichotomy and the way in which politicians and bureaucrats engage with one another in developing countries (Dasandi and Esteve 2017). This has led to a severe gap in understanding of the dichotomy from a developing country perspective. Compounding this significant knowledge gap, and of concern, is that "best practice" governance approaches adopted in developed countries are "suggested" by donors and developmental organizations and transferred to developing countries, with simplistic, prescriptive intentions aimed at addressing public sector improvement failures. These good-intentioned strategies ignore the significant country-to-country political and administrative differences and have the potential to severely exacerbate underlying politics–administration tensions (Levy 2014).

To lay a foundation for understanding a brief explanation of the politics–administration dichotomy, an underlying theory, history, and various interpretations are provided. Insight into the means by which politicians and administrators engage with each other and the factors that shape this engagement and reform efforts in the public sector of a developing country, namely Fiji, are also discussed. The aim is to inform researchers, scholars, donors, developmental organizations, and policymakers, and in so doing, aid closure of the noticeable developing country knowledge gap.

## Politics–Administration Dichotomy

It is suggested that two basic government functions exist in all government systems, namely politics and administration. Reference to these terms as applied in this chapter respectively refer to the expression of the will of the state in terms of formulating policies for control, allocation and use of resources ("politics"), and the execution of the will of the state by carrying out that policy (public "administration") (Goodnow 2003). The politics–administration dichotomy is a theory that constructs boundaries between political and administrative functions and holds that political interference in administration would erode the opportunity for administrative efficiency, and that the policymaking activities of government ought to be wholly separated from the administrative functions (Shafritz 1985, p. 415). Notwithstanding, many authors do not use the term "dichotomy" but rather refer to "differentiation" (Goodnow 2003) and "discrimination" (Wilson, 1887) between politics and administration (Overeem 2012).

The politics–administration dichotomy "has been subject to much academic interest and debate… this debate centers on the respective roles of politicians and administrators in the policy process and the nature of the relationship between them" (Dasandi and Esteve 2017, p. 2). Based on the principal-agent theory, it would seem reasonable to suggest that clearly defined roles and responsibilities of politicians (as elected officials and the "principals" responsible for formulating policies) and bureaucrats (as "agents" tasked with implementing policies) exist, and conflict and tension between the two authorities would not exist (Nyadera and Islam 2020). However, in reality politics is directly and indirectly involved in public administration to ensure practical implementation of policies and

decisions made by politicians. Also, public administrators are increasing involvement in politics at all levels of government, through influence on and making of political decisions (Alford et al. 2017) and design and drafting of public policy (Svara 2001). Hence, an uncomfortable nexus exists in the core relationship between politicians (desirous of policymaking, while pleasing citizens and posturing for reelection) and bureaucrats (confronted with the complexity of simultaneously balancing support of politicians in policymaking and reacting to directions and interference of politicians and other interested parties in policy implementation, while maintaining political neutrality and professional integrity, efficiently and effectively managing public sector organizations, and serving the public) (Svara 2001; Waterman et al. 2004). Conflict and tension inevitably arise as a result of the related complexity and breaches and the interplay of the forces of control and independence that could lead one to dominate the other (Krause 1999); associated issues including overlap in roles, accountability, and responsibility; and conflict of interest between elected and appointed leaders (Nyadera and Islam 2020).

## History and Interpretation of the Politics–Administration Dichotomy

Woodrow Wilson (28th US president from 1913 to 1921) proposed administration to be separated and distinct from politics in government. Wilson authored and published *The Study of Administration*. In this seminal article Wilson (1887, pp. 209–210) argued that "Politics is state activity in things great and universal, while administration, on the other hand, is the activity of the state in individual and small things" and "Politics is thus the special province of the statesmen, administration of the technical official. Policy does nothing without the aid of administration; but administration is not therefore politics." Wilson went on further to state that "administration lies outside the proper spheres of politics" and "administrative questions are not political questions."

Literature remains divided as to whether Wilson authored and championed the politics–administration dichotomy or not, and as to interpretations of the dichotomy (Uwizeyimana 2013). Some contemporary authors attribute to Wilson the idea of the politics–administration dichotomy based on his "unambiguous" writings and suggesting that while politics influence policies and administration is the execution of such policies (Goodnow 2003), a boundary exists between both spheres (Overeem 2012). Other authors openly critique such attribution and interpretation on the basis that Wilson "did not set out to separate the public administration and politics functions, nor did he wish to exclude administrators from political affairs" (Uwizeyimana 2013, p. 167). Some of the main critics (Lilienthal 1944; Waldo 1955) dismissed and rejected the indefensible concept of a politics–administration dichotomy and the idea that the work of the government could be divided into two parts: policy decision-making and policy execution (Uwizeyimana 2013, p. 169). There are even some authors who publicly neither attribute the politics–administration dichotomy to Wilson, nor deny he championed the dichotomy, and they contend that Wilson's article was poorly written, contradictory in nature, "ambiguous" and at best difficult to interpret (Uwizeyimana 2013). Additionally, they argue for a less divisive and more cooperative relationship than a strict dichotomy proposed by Wilson (Waldo 2007), and that the two poles of the dichotomy complement each other and should be conceptualized with both bureaucrats and elected leaders in collaboration (Svara 2001).

## Complementarity of Politics and Administration

According to Svara (2001, p. 179), "the complementarity of politics and administration is based on the premise that elected officials and administrators join together in the common pursuit

of sound governance." Complementarity acknowledges the interdependence and reciprocal influence between elected officials and administrators. Also, while elected officials and administrators maintain separate and distinct roles, both operate in a mutually supportive manner, and their functions overlap (Svara 2001, p. 179), and both are instruments and contributors to the political process (Cook 1996). Complementarity is suggested to reconcile the contradictory aspects of the politics–administration dichotomy with politicians maintaining control, while at the same time allowing administrators involvement in policymaking and independence to implement policy and serve the public (Svara 2001). Reciprocating values also underpin the complementarity. Nevertheless, elected officials could dominate administrative activities but are constrained by respect for administrative competence and commitment; and administrators could use their resources and take a self-directed approach, but are constrained by a commitment to accountability to the complementarity relationship (Svara 2001, p. 179). The interrelationship between the elected officials' degree of political control and the administrative level of independence provides an assortment of relational models. Where the level of political control or administrative independence is extreme, and the reciprocating value is absent, respectively, "political dominance" or "bureaucratic autonomy" can be present. Another relationship that could also exist is with low political control, low administrative independence, and an absence of a reciprocating value, which could result in a "stalemate" between both parties. Complementarity occurs with "ongoing interaction, reciprocal influence, and mutual deference between elected officials and administrators" (Svara 2001, p. 180).

## Politics/Administration Zones

Alford et al. (2016) are of the view that a fluid, blurred transition area ("purple zone") with indeterminate roles and relationships, and ambiguity, exists between the domains of politics ("red zone") and administration ("blue zone") in addition to a clear line of delineation. The zone concept suggests that public managers formally and informally move in and out of the political domain through the shared area of the "purple zone," not to usurp the authority of politicians but rather to assist administrators in achieving desired outcomes. Alford et al. (2016, p. 14) also suggest that the clear line of delineation between politicians and administrators may have been devised at a time "where situations are routine, stable, and uncontested, and the orderly separation of roles inherent in the dichotomy may apply," as opposed to the current times where wicked and complex problems are now commonplace.

## Types of Bureaucratic Relations

Dasandi and Esteve (2017, pp. 3–4) introduced four models of political–bureaucratic relations. These relations are suggested to be based on two dimensions, namely separation ("the extent to which political and administrative spheres are formally distinct") and autonomy (the extent to which bureaucrats have the freedom to perform their assigned functions without political interference). Under conditions of high role separation between politicians and bureaucrats ("intrusive" and "integrated" models), bureaucrats must act in accordance with political demands while maintaining neutrality in policy implementation; however, with low role separation ("collusive" and "collaborative" models) responsibilities are diluted between politicians and bureaucrats, who both perform the various functions. With high autonomy ("integrated" and "collaborative" models) politicians and bureaucrats' functions are clearly assigned with bureaucracy provided sufficient space to work out policy implementation; while with low separation ("intrusive" and "collusive" models) bureaucrats when

undertaking their responsibilities are subordinated to politicians.

## Public Enterprise Reform in Fiji

Structural adjustment policies of many developing countries like Fiji were introduced in the 1990s to address the internal pressures resulting from sluggish national development and high levels of inefficiency and ineffectiveness, and external pressures from the donor and developmental agencies (Rahman et al. 2013). New Public Management (NPM) practices formed the basis of political, economic, and public sector reforms (An and Sharma 2015) and emphasized an adoption of commercial practices, and a transition from accountability for inputs controls (bureaucratic procedures, rules, and standards) to quantifiable outputs and results, devolution of management controls, enhanced reporting, and cost-cutting and efficiency (Awio et al. 2007).

In Fiji, when the Public Enterprise Act 1996 came into effect, the Ministry of Public Enterprises and Public Sector Reform was established. The Ministry was responsible for monitoring and encouraging state-owned enterprises to reform and adopt commercial practices in order to enhance their profitability, efficiency, and accountability, and to return a dividend to the government. The Public Enterprise Act 1996 also defined how state-owned enterprises were established, managed, and supervised, and provided a markedly different governance structure for state-owned enterprises. The government remained the "owner" and maintained oversight of each state-owned enterprise; however, it appointed a commercial board of directors responsible for strategic direction, commercial performance, and government reporting (An and Sharma 2015). Currently, 15 state-owned enterprises are established, including enterprises such as Airports Fiji Limited, Fiji Ports Corporation, Fiji Rice Pte Limited, Maritime Safety Authority of Fiji, and so on. Subsequently, to ensure Fiji state-owned enterprises remained relevant and aligned with international best practice, the politics–administration dichotomy was mitigated, reform efforts were more effective, and the legislation governing those state-owned enterprises was updated with gazettal of the Public Enterprise Act 2019 (Government of Fiji 2019).

## The Politics–Administration Dichotomy in Fiji

Over a ten-year period (2010–2020) interactions with, feedback from, and observations of politicians and public servants in Fiji in terms of how they engaged with each other, and the politics–administration dichotomy, were compiled and have been interpreted according to the types of political–bureaucratic relationships as promoted by Dasandi and Esteve (2017), politics/administration zones as supported by Alford et al. (2016), and the complementarity model as advocated by Svara (2001). These interpretations provide meaningful insight into the politics–administration dichotomy experienced between politicians and administrators of state-owned enterprises in Fiji.

A number of characteristics of the political–bureaucratic relationships in Fiji suggest that a collusive model (low role separation and low bureaucratic autonomy) has been inculcated and is in existence for some time. Relational characteristics to support such a suggestion include: due to personal ties, control is vested in a small number of politicians and bureaucrats; bureaucratic "machinery" of government is geared such that rent-seeking is a primary objective; employment in the bureaucracy is conditional upon absolute loyalty to the politicians in power; high degree of political interference in the day-to-day operationalization by the administration of the government policies; and large, inefficient, and ineffective bureaucracies predominate. It is important to note that "all states at some point in time had public services based on patronage systems with collusive political-bureaucratic relations" (Dasandi and Esteve 2017, p. 15). Relational conflict has been extreme and perpetuated the politics–administration. Notwithstanding, concerted efforts have been underway by the government to transition to a more integrated (high role separation and high bureaucratic autonomy)

model. This desired transition is also typical of donor-promoted governance reforms of developing nations undergoing NPM reform (Dasandi and Esteve 2017). Evidence of this transition is noted in clearer role separation between politicians and bureaucrats and bureaucratic autonomy (with the introduction of the Public Enterprise Act 2019), implementation of merit-based civil service systems for recruitment and promotion that limit political interference, and a more "rule-of-law based politically neutral civil service," with bureaucrats primarily focused on advising politicians and implementing their decisions and reform (Dasandi and Esteve 2017, p. 14).

As suggested by Alford et al. (2016, p. 3), administrators undertake "forays into the political domain" in order to "deliver quality services in the public interest" and in so doing create a blurred zone between politicians and administrators. Evidence of administrators' foray into politicians' domain was noted in Fiji. Political behavior of administrators included selective control and delay in the provision of information to politicians and other stakeholders; restriction of time available to either speed up or delay a decision; use of bureaucratic processes to delay decision-making; questions posed to create confusion; distortion and downplaying of critical issues; and influence of stakeholders in order to unduly limit politicians' room to maneuver. Each of these administrator behaviors had the potential to usurp politicians' decision-making. Conversely, politicians also forayed into the administrator's domain, further creating a blurred and overlapping zone of the interface. Politicians' high degree of interference in the day-to-day operationalization by the administration of the government policies was noted in public administrative matters such as planning, allocation, and use of public funds, staffing, budgeting, reporting, and decision-making. Such interference was continuous, frustrating administration and reform efforts, and also had the potential to usurp the administrators' decision-making. The fluidity of the zones and boundaries between politicians and administrators, the absence of a clear line between policy and administration, no general agreement in the blurred zone as to who should do what, and the continuous operation within the blurred zones by both politicians and administrators frustrated both politicians and administrators and only contributed further to the perpetuation of the politics–administration dichotomy.

In Fiji, history has shown that conditions of high political control and low administrative independence have prevailed, with a great emphasis on hierarchy and subordination of administrators (politicians dominated over administrators), low-quality governance and service, tensions between politicians and administrators unreconciled, and the politics–administration dichotomy exacerbated and perpetuated. Under conditions of high political control and low administrative independence, the propensity for loss of administrative competence, degradation of administrative morale and performance, and political corruption is high (Svara 2001). Notwithstanding, concerted NPM and other reform efforts (reinforced by the recent gazettal of the Public Enterprise Act 2019) have been undertaken by the government to transition toward complementarity of politics and administration, and in so doing "politicians and administrators join together in pursuit of sound governance" (Svara 2001, p. 179). These efforts have been evidenced by enhanced "interaction, reciprocal influence, and mutual deference" (Svara 2001, p. 180) between politicians and administrators, more regular communication with citizens and administrators assisting in shaping policy and providing meaning to policy implementation, while politicians oversee policy implementation and address complaints about poor policy implementation performance.

A study of the politics–administration dichotomy also has important implications relating to avoidance of using public servants for partisan political purposes, and the need to maintain political impartiality when administering the laws.

## Conclusion

A collusive model of political–bureaucratic relations, the fluidity of the zones and boundaries between politicians and administrators, and conditions of high political control and low

administrative independence have prevailed in Fiji for many years and perpetuated the politics–administration dichotomy and conflict between politicians and administrators. These prevailing conditions have adversely affected public sector governance, reform, and service delivery. In more recent times, concerted efforts by the government of Fiji to transition toward a more integrated model of politics and administration, with complementarity and clarification of role separation between politicians and bureaucrats and bureaucratic autonomy, has provided the opportunity for politicians and administrators to mitigate the politics–administration dichotomy somewhat and in so doing drive much-needed governance and public sector reform outcomes beneficial to the nation.

Elected politicians and an innumerable number of actors seek to influence the policy choices of public administrators. These influences have wide-ranging impact on public service professionalism, leadership and decision-making, efficiency and effectiveness, and ultimately service delivery to citizens. Future studies should focus on the challenges, dilemmas, coping patterns, and "crafted" practices of public servants to navigate the politics–administration dichotomy, in what is "an increasingly turbulent, incident-prone and unforgiving political environment" (van Dorp and 't Hart 2019, p. 889).

## Poor and Social Policy, The

Laura K. McDavitt
Jackson State University, Jackson, MS, USA

### Synonyms

Destitute; Impoverished; Indigent; Poverty; Poverty-stricken; Under privileged

### Definition

**Aid to Dependent Children (ADC)** was created as Title IV of the Social Security Act of 1935 and provides federal grants supplying a third of the cost associated for states to continue and underride their mothers' aid laws, which assisted single mothers without the presence of a male breadwinner and were originally developed between 1910 and 1920. This program was later renamed the Aid to Families with Dependent Children (Gordon 2014).

**Consumer Price Index (CPI)** a federal data report produced each month on changes that urban consumers have paid for representative goods and services (U. S. Bureau of Labor Statistics 2013).

**Cultural Poverty Theories** are theories that examine individual characteristics and individual behaviors that might increase poverty (Cellini et al. 2008).

**Economic Opportunity Act of 1964** began the "war on poverty" during the Lyndon B. Johnson administration and created the Office of Economic Opportunity with a mission to combat poverty and provided funding to Community Action Agencies that serviced the low-income citizens by facilitating equal opportunities in areas like education, training, and jobs (California Health and Human Services Agency 2015).

**Federal Earned Income Tax Credit** was developed in 1975 and is a federal poverty prevention program designed to provide targeted support in the form of a yearly tax credit for qualifying poor by promoting work without creating negative financial impact on employers (Hartig et al. 2014).

**Federal Grant-in-Aid** refers to federal funds allocated to another government, institution, or individual to carry out a particular policy or program (USLegal, Inc 2016).

**Labor Market Theories** are theories that look to labor market failures and the role employment plays in the levels of poverty (Cellini et al. 2008).

**New Deal** refers to economic policies and programs developed and promoted under the President Franklin D. Roosevelt administration between 1933 and 1938 to provide poverty relief and economic stimulation to help end the Great Depression in the United States (WebFinance Inc 2016).

**Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) of 1996** repealed Title IV of the Social Security Act of 1935, which created the categorical entitlement program Aid to Families with Dependent Children program, and replaced it with the Temporary Aid to Needy Families that provides benefits that are limited in duration and tied to work requirements (Social Security Administration 2015).

**Poverty** as defined by Peter Townsend's states *"Individuals, families and groups in the population can be said to be in poverty when they lack the resources to obtain the types of diet, participate in the activities and have the living conditions and amenities which are customary, or at least widely encouraged or approved, in the societies to which they belong. Their resources are so seriously below those commanded by the average individual or family that they are, in effect, excluded from ordinary living patterns, customs and activities"* (Hicks 2014).

**Poverty Line** is set by each state to identify the standard family income threshold that a family must fall below to be eligible for welfare assistance and to be classified as poor in the United States (WebFinance Inc 2016).

**Situational Poverty Theories** are theories that focus on how the social structure and demography that limits one's access to economic opportunity impact poverty levels (Cellini et al. 2008).

**Social Causation Theory** speculates that both the physical and mental stress associated with living

in poverty fuels increased physical and developmental attributes (Santiago et al. 2013).

**Social Security Act of 1935** created system that raised revenue to support and provide general welfare benefits to senior citizens, the blind, dependent, and crippled children (Social Security Administration 2015).

**Supplemental Poverty Measure (SPM)** a Census Bureau measure developed in 2011 to provide a more accurate picture of poverty in the United States by address many of the criticisms of the original and official poverty measure (Social Security Administration 2015).

**Welfare Queens** a derogatory slang term referring to a female who exploits the welfare system and lives a life of luxury with the funds received (Oxford University Press 2016).

**Working Poor** is a term that refers to individuals who work at least 27 weeks and still fall below the poverty line or who work, are above the official poverty line, do not qualify for assistance but still live in poverty, and often ignored in poverty measures and policy planning (Rossi and Curtis 2013; U. S. Department of Commerce 2016).

## Introduction

In the United States, social policies concerning the poor are a complex and powerful gumbo developed in the stockpot of our history, built with the disjointed bones of federalism and seasoned with deep cultural beliefs and values about poverty, the poor, and their rights to public assistance. This entry is an overview of how public opinion, poverty measures, and historical influences have helped shape social policies in response to the needs of the poor in the United States and a brief overview of these policies.

According to the Office of Management and Budget (OMB) being poor in the United States is a quantitative line in the sand that does not vary geographically and is determined by income levels based on family size and the current Consumer Price Index (U. S. Department of Commerce 2016). For example, in 2016 a family of four that earns $24,300 lives in poverty (Families USA 2016). Referred to as the poverty threshold, this circumscribed definition has limited one's understanding of what it really means to live in poverty and is a relative measure in that compares one family to the next (Aber et al. 2012; Branham 2011). An additional limitation is its lack of flexibility, as it would be difficult to argue that a family of four making an additional $100 per year would not also be living in poverty (Rossi and Curtis 2013). In 1979, Peter Townsend developed a more comprehensive often-quoted definition of poverty that is still relevant today that states:

> Individuals, families and groups in the population can be said to be in poverty when they lack the resources to obtain the types of diet, participate in the activities and have the living conditions and amenities which are customary, or at least widely encouraged or approved, in the societies to which they belong. Their resources are so seriously below those commanded by the average individual or family that they are, in effect, excluded from ordinary living patterns, customs and activities. (Hicks 2014)

This definition emphasizes the subjective nature of poverty and how local economics and both individual and cultural perceptions influence one's conceptualization of poverty (Aber et al. 2012). Differences in the public's perceptions of poverty over time have influenced public policy as well as further complicate the concept considerably (Pimpare 2009). While it may be tempting to compare poverty to past standards or other cultures, it often seems inadequate for those experiencing poverty or for the development of appropriate public policy (Pimpare 2009). It is generally accepted that in the United States poverty means more than simply surviving starvation, instead it includes the ability to secure housing, care for the health and wellbeing of one's family, and to hold down a job (Blank 2008). In recent years, defining poverty has been further fragmented by including discussions of the working poor, which although is not a term acknowledged by the U S Census Bureau, often refers to individuals who work at least 27 weeks and still fall below the poverty line (Rossi and Curtis 2013; U. S. Department of Commerce 2016). A slightly different definition of the working poor refers to those individuals who work and are above the

official poverty line and do not qualify for assistance but still live in poverty and are often ignored in poverty measures and policy planning (U. S. Department of Commerce 2016; Rossi and Curtis 2013).

In the late 1950s, the poverty rate was 22.4% and by 1973 it reached a low of 11.1% and began creeping back up the 1980s (The University of Michigan 2016). In 2014, the poverty rate was 14.8%, which includes approximately 47 million people in the United States (U. S. Department of Commerce 2016). Throughout history, those most affected by poverty have been the unemployed women who headed families with children and senior citizens (Katz 1995). Interestingly, the 1970s drop in poverty is attributed mainly to reductions in senior citizen poverty rates (The University of Michigan 2016). Children, on the other hand, continue to be hit hard by poverty, they only comprise 24% of the population, yet are 36% of those living in poverty (The University of Michigan 2016). In addition, African-Americans, American Indians, and Hispanics are all disproportionally affected by poverty (U. S. Department of Commerce 2016; The University of Michigan 2016).

In the United States, research has found that poverty for many is not a permanent state, and it is common to move in and out of poverty over time (Cellini et al. 2008). Research suggests that approximately 75% of citizens in poverty move out in less than 4 years (Cellini et al. 2008). Yet, any number of setbacks, crises, or bad decisions can cause an individual or family to fall quickly back into poverty (Conway and Norton 2002). Another abiding characteristic of poverty in the United States is the tendency for those living in poverty to cluster together in regions or in neighborhoods around the country (Ferrigan 2015; Katz 1995). This clustering, or segregation, creates a detrimental isolating environment that contributes to the challenges faced by those living in poverty (Ferrigan 2015; Katz 1995).

Although the impact of poverty is beyond the scope of this entry, it is important to note that it permeates the lives of those living in poverty as well as our cultural and economic burden placed on society. For example, researchers have linked poverty to increase chronic and mental illness, tobacco and drug use, obesity, and exposure to physical abuse (Roberts 2006; Santiago et al. 2013). In addition, children who grow up in poverty experience delays in cognitive development, increased behavioral problems, depression, and exposure to violence and chronic disease (Kaminski et al. 2013). The social causation theory speculates that both the physical and mental stress associated with living in poverty fuels increased physical and developmental attributes (Santiago et al. 2013). Furthermore, living in poverty can have a negative impact on behavioral choices that can lead to poor decisions that impact one's life (Roberts 2006).

## The Impact of Public Opinion on Social Policy for the Poor

Much of the research on public policy concerning the poor is directed towards understanding how the public attitudes towards poverty and towards the government's obligations to the poor have influenced the political agenda and development of public policy in the United States. Historically, public attitudes that have helped influence the development of social policies on poverty include the belief that there are deserving poor and undeserving poor, that upward mobility is possible with hard work, and that families and private charities should and could manage the needs of the poor, and government intervention makes poverty worse (Williams 2009; Katz 1995; Smiley 2012). There is little historical evidence to suggest public support for early Christian teachings that poverty was a blessing or that the poor be treated with dignity that induced charity among the wealthy, instead the wealthy often viewed the poor as broken individuals that needed their guidance on how to mend perceived character flaws (Piven and Cloward 1993; Smiley 2012).

At the heart of these early beliefs are those who cannot help themselves, for example, children, the elderly, or infirmed and those who can help themselves and simple do not because of character flaws such as laziness, drunkenness, dishonesty, faulty parenting, or lose morals (Piven and

Cloward 1993; Katz 1995; Williams 2009; Rose and Baumgartner 2013; Tangler and Cozzarelli 2013). In public opinion, women and children fared better than men, and in many cases it was mistakenly believed if a man wanted to work he could, except during times of war this was not always the case, this belief resulted in little public sympathy and few direct policy interventions directed towards men (Katz 1995). This is an example of how that attitudes about public assistance corresponds more to the concept of deservingness and less on need and is a belief that still linger today (Tangler and Cozzarelli 2013).

In addition, poverty policy has been influenced by the strong, but mistaken belief that upward mobility is possible for anyone willing to work hard in the United States (Williams 2009). There are significant impediments for economic mobility for many, yet there are examples of those who escape poverty, but these are the exception and not the rule and fuels misconceptions by the public about work ethics and the poor (Williams 2009). These attitudes helped spur a host of poverty interventions designed to correct the perceived flaws of the poor (Katz 1995). Not until the 1960s with the War on Poverty did poverty start to be viewed more as a structural or situational problem that helped lead to the development of programs to address tangible needs like educational deficits, job-skills training, and lack of transportation or childcare (Williams 2009).

Another strong negative public belief concerns governmental involvement in poverty prevention and this has also helped shape social policy. Many believed that originally, society successfully cared for their poor privately through charities, churches, and families with little public assistance and that the problems of the poor can and should be handled through the private sector, with additional doubts about the fundamental rights to governmental protection from poverty (Katz 1995; Piven and Cloward 1993; Tangler and Cozzarelli 2013; Conway and Norton 2002). Furthermore, concerns existed about the negative impact of public assistance on recipient's work ethics, encouraged reliance on public handouts, feelings that a working wage should be the primary source of income; fears of excessive abuse of public programs, basic distrust of governmental intervention, and dislike of taxes have permeated poverty policy development (Katz 1995; Danguerre 2011; Rose and Baumgartner 2013). Finally, social policy towards the poor has been further influenced by the belief that poverty relief should supply only the minimal benefits needed to survive and not exceed the minimum citizen's income to encourage employment (Pimpare 2009; Katz 1995).

Over time, many of these beliefs and attitudes concerning the poor and poverty policy have surged to the forefront while another loses steam and has influenced political agendas and the development of social policy (Rose and Baumgartner 2013). For example, during the Great Depression in the 1930s when unemployment skyrocketed, attitudes began shifting away from the assumption that poverty was a moral defect, while increasing feelings that public assistance was a basic human right and that governmental support was a necessary component of poverty prevention (Piven and Cloward 1993; Tani 2012). During the early 1960s, there was a strong social movement to address poverty that helped shift attitudes further away from individual character flaws to systematic and situational flaws and was fueled in part by an urgency to correct racial inequalities in education, health, housing, and community (Rose and Baumgartner 2013). By the late 1960s and early 1970s the public's enthusiasm began to wane, and attitudes again returned to the moralistic judging of the poor that they needed to work harder and avoid dependence on crippled government benefits (Rose and Baumgartner 2013). In the 1980s and 1990s, these attitudes expanded, and concerns over program abuse, excessive program spending, family breakdown, and individual responsibility flourished with racial undertones with terms like "welfare queens" becoming prevalent (Danguerre 2011; Rose and Baumgartner 2013). These attitudes combined with a desire to reduce government spending have placed the plight of the poor on the back burner for many, and it has remained relatively low on most recent political agendas (Rose and Baumgartner 2013).

The ebb and flow of public sentiment towards poverty is understandable when faced with multiple variables influencing this complex subject. Researchers are also still grappling to find a comprehensive theory to explain the root causes of poverty (Cellini et al. 2008). Theories tend to divide roughly into three broad categories: labor market theories, situational poverty theories, and cultural poverty theories (Cellini et al. 2008). Labor market theories look to labor market failures and the role employment plays in poverty (Cellini et al. 2008). For example, an underlying tenant of capitalism is a natural flow and change in levels of employment over time, which intensifies during times of rapid modernization or economic depression (Piven and Cloward 1993). While situational poverty theories focus attention to the social structure and demography that limits one's access to economic opportunity (Cellini et al. 2008). These theories include theories that look at common situational characteristics or features found in clusters of poverty that are stumbling blocks for the poor, such as quality of education or local access to employment (Murphy 2010). Other researchers have explored how individual characteristics and individual behavior affects the poor and if there exists a "culture of poverty" that can be inherited (Cellini et al. 2008). There theories developed in the late 1960s, although today there is little evidence that individual character flaws are at the root of poverty (Cellini et al. 2008).

## Poverty Measures and Social Policy for the Poor

How we measure poverty also influences social policy towards the poor, and a large body of research examines the US methods of calculating poverty levels. In 1965, Molly Orshanshy, an accountant with the Social Security Administration, developed the current federal poverty level measures not as measure for practical means but as a tool for research during the War on Poverty yet it was adopted as such (Pimpare 2009; Cellini et al. 2008; Blank 2008). The measure is based primarily on the annually adjusted cost for food, based on the Consumer Price Index, multiplied times three, to account for other living expenses and then adjusted for the size of the family (Cellini et al. 2008; Blank 2008). The family's income or resources are determined by the annual before tax cash income and excludes tax credits or other in-kind services (Cellini et al. 2008).

Over 50 years later, this measure is considered by many scholars to be flawed, out-of-date, and a poor indicator of poverty or program efficiency (Bernstein and Shierholz 2014; Blank 2008; Defina 2008; Cellini et al. 2008). Markedly, it is largely based on outdated consumption patterns and poverty thresholds, which has created a discrepancy between the poverty line and what it realistically cost to meet basic needs, some estimate the figure needs to be doubled (Hartig et al. 2014; Chung et al. 2013; Pimpare 2009). A common concern also is its geographic uniformity, which may ease program administration and appeals to one interpretation of equity but in high cost of living areas, it is hardly equitable (Levitan et al. 2010). Other concerns about the measure includes how resources or income is measured; by arguing, that it should be based on after-tax figures and include in-kind resources, such as tax relief or credits, food, healthcare, and housing assistance (Blank 2008; Chung et al. 2013). Another criticism is the measure includes a mother and children but failure to include any unmarried cohabitating partners in income calculations (Chung et al. 2013; Cellini et al. 2008). In addition, the measure makes it extremely difficult to gauge the long-term impact governmental interventions have on poverty as that they are often not included in the measure (Blank 2008; Hicks 2014).

Although the official poverty measure has changed little over time, there have been some efforts to accommodate these flaws in the system (Pimpare 2009; Bridges and Gesumaria 2015; Blank 2008). For example, many public programs targeting the poor inflate the cut-off eligibility levels between 125% and 200% of the poverty threshold (Pimpare 2009). In addition, there have been some federal efforts to find a more promising measure, but these efforts rarely have produced substantive changes (Blank 2008; Chung et al.

2013). One notable exception was the release of the supplemental poverty measure (SPM) that provides a measure that includes in-kind government benefits, excludes taxes, uses a broader measure of expenditures, and varies geographically based on the cost of living (Bridges and Gesumaria 2015; Chung et al. 2013). Although the official poverty thresholds levels have not adjusted it does provide an alternate picture statistically about poverty in the United States and has shown that poverty rates are slightly higher than originally reported (Bridges and Gesumaria 2015). Most researchers agree that changing the official poverty thresholds is politically unlikely primarily because a change would have significant financial impact due to the predicted jump in eligible benefit recipients and the technical difficulties associated with finding an agreeable measure (Blank 2008; Pimpare 2009; Ladd 2012; Rossi and Curtis 2013).

## Historical Influences on Social Policy for the Poor

To understand today's social policies on poverty in the United States, it is essential to acknowledge a few important historical milestones in its development. From the earliest historical roots, there have been governmental efforts to manage the needs of widespread poverty in the United States with policies borrowed primarily from the decentralized, tax-supported British Elizabethan Poor Laws (Trattner 1999; Katz 1995). For example, by the late colonial period, most city government's largest expense, averaging from 10% to 35%, was on the poor additionally, federal aid was funding multiple social programs including the first federal military pension with the 1818 Revolutionary War Pension Act (Trattner 1999). Even larger relief efforts initiated after the Civil War and provided relief for veteran, war widows, and for newly freed slaves (Trattner 1999). These and other early poverty relief efforts were influenced by federalism that resulted in a disjointed approach to poverty by mostly local governments wrapped in tensions caused by class, ethnicity, and gender differences in an attempt to "fix" the poor that are reflected in today's policies (Katz 1995; Tani 2012).

The Great Depression was a major turning point in poverty relief as unemployment exploded; local governments and private charities attempts to manage the poor were exhausted and President Roosevelt's New Deal moved the federal government into the driver's seat in the development and funding of a more comprehensive structured effort to relieve poverty (Tani 2012; Katz 1995). Two programs worth noting include the 1935 Economic Security Act provision for the Aid to Dependent Children that became the Aid to Families with Dependent Children, which is commonly referred to as "welfare" and the 1935 Social Security Act, which began a social insurance that is credited with preventing many senior citizens from falling into poverty (Tani 2012; Katz 1995). Although, originally intended as a temporary fix to the depression, many of the New Deal's programs became permeant policy of the federal government, which still exists today (Tani 2012; Katz 1995).

The Great Society or War on Poverty was set in motion with the 1964 Economic Opportunity Act designed to address education and job opportunities of the poor and began a second influential and unique period in the expansion of social policies for the poor and spurred a 10% poverty rate drop in 15 years (Rose and Baumgartner 2013; Danguerre 2011). During this period, there were increases in benefits and available services that included food stamps, Head Start, Medicaid, Medicare, Supplemental Social Security, Legal Services Programs, Jobs Corp, Neighborhood Youth Corp, and Community Action Programs (Price 2010). Policy development during this period lacked clear coordination and waffled between social policies that attempted to change the behavior of the poor and policies that attempted to stimulate labor markets, which weakened federal efforts (Danguerre 2011; Katz 1995). Yet there was a clear upswing in attention to often unsuccessful place-based corrective measures, especially in urban communities with high concentrations of African-Americans, a new policy agenda influenced by the Civil Rights Movement (Katz 1995; Price 2010). Marked

improvements included increased focus on community involvement, recipient's access to information and resources, and providing a safety net with a special emphasis for children and senior citizens (Williams 2009; Price 2010). In addition, during this period poverty rates were positively affected by the new civil rights laws, which helped expand job opportunities for many minorities (Edelman 2014).

These are just a few examples of points in history where great growth in the United States policy development has contributed to current social policies aimed at reducing poverty. Also important in shaping our current system are more conservative periods like the 1980s and 1990s that looked to cut or reduce dependency on government programs (Stricker 2000). A notable example is the 1996 Personal Responsibility and Work Opportunity Reconciliation Act, which redesigned the Aid to Families with Dependent Children to the current Temporary Aid to Needy Families in an attempt to reduce dependence on governmental programs (Rossi and Curtis 2013). Key changes included expansion of welfare-to-work programs, ending federal welfare entitlements, and establishing time limits on welfare benefits (Reese 2007; Parisi et al. 2005). As a result, cash benefits have decreased with the Temporary Assistance for Needy Families, yet noncash benefits like SNAP and work-related tax credits have grown significantly (Chung et al. 2013).

This gumbo of strong cultural beliefs, inadequate poverty threshold measure, and complex history becomes even more convoluted by adding the shifting interpretations of United States federalism, federal, state, and local government's rights, multiple policy agendas, policy execution, and fiscal responsibilities into the mix (Hatcher 2010; Katz 1995). The complexity of addressing poverty has contributed to a significant federal role in program development and funding, yet states and local governments have remained the primary lead on implementation and tailoring programs to meet local interest and have resulted in great geographical variance among social programs in the United States (Gundersen 2006; Hatcher 2010; Katz 1995). Funding now is primarily provided through federal grant-in-aid funding to ensure budget cuts at the local level do not negatively affect the poor, yet states still have significant fiscal responsibilities, which creates inter-governmental tensions and influences services (Hatcher 2010). State and local variance in implementation, practices, and benefits exist and do affect those living in poverty (Parisi et al. 2005). For example, Mississippi's has a strong program emphasis on caseload reduction and discouraged application for assistance that might vary in a less conservative state (Parisi et al. 2005). Other varying state and local laws can further influence the success of federal poverty reduction efforts. An example, citizens eligible for federal tax credits might still be subject to state and local taxes (Hartig et al. 2014).

## Current Social Policies for the Poor

The consequences of our past, values, and governmental structure have produced a vast, complex, and disjointed system for social policies for the poor (Rose and Baumgartner 2013). Some programs are overt methods and others are less obvious to the public but intended to provide relief or are a stopgap for poverty, and those less obvious often are viewed as a citizen's right and less as government handout (Danguerre 2011). For example, unemployment insurance, created by the Social Security Act of 1935, was a temporary poverty-preventing stopgap in response to the monumental layoffs during the Great Depression has for the most part avoided a negative stigma by the public and is viewed as an acceptable right (Danguerre 2011).

The public educational system in the United States is another powerful poverty prevention tool that is often overlooked and underestimated, it was developed to not only educate and provide work skills but also imparts values, attitudes, and counterbalances perceived parenting shortcomings among the poor (Cellini et al. 2008; Katz 1995). For example, few realize that high schools developed when jobs were scarce and attending high school provides alternative for teens looking for employment (Katz 1995). More obvious

poverty prevention efforts were educational programs developed during the War on Poverty like Head Start that specifically targets children from low-income families (Hale 2012). Although, some research suggest that we have moved away from this priority with the current No Child Left Behind based system, which has reduced the educational systems positive effects on children living in poverty as its tendency towards standardization lessons educators' ability to address unique educational challenges (Ladd 2012).

Other programs create great debate among scholars as to their effectiveness in addressing poverty and one example includes the minimum wage. Supporters of the minimum wage site that it has had a significant impact on preventing poverty and that raising it would be beneficial especially in single female-headed families with children and that it gives value to and encourages the nonworking to seek employment (Defina 2008; Bernstein and Shierholz 2014). Others say that the minimum wage is not a tool to prevent poverty and has little positive effect on poverty rates and that raising it would be harmful because it would spur reductions in work hours, increases job losses, and often benefits nonpoor families (Sabia 2014; Defina 2008; Bernstein and Shierholz 2014; Levitan et al. 2010).

A less controversial program is Social Security, created by the Social Security Act of 1935, a popular form of social insurance, which is income-transfer program that does not use means testing, and is available for anyone who meets designated criteria, such as age or disability (Danguerre 2011; Katz 1995). The program has been credited with being one of the most successful and if ever eliminated would potentially drop many senior citizens into poverty and yet, many citizens fail to associate it as form of welfare or poverty relief (Reno and Ekman 2012; Danguerre 2011).

Another important policy tool in fighting poverty is the Federal Earned Income Tax Credit developed in 1975 and designed to provide targeted support for the poor by promoting work without creating negative financial impact on employers (Hartig et al. 2014; Danguerre 2011; Sabia 2014; Bernstein and Shierholz 2014). The program provides refunds of up to $6044 for those eligible and for the most part has been considered a successful poverty-prevention program, especially for children, and is practically popular with those who oppose raising the minimum wage (Branham 2011; Chung et al. 2013; Hartig et al. 2014; Bernstein and Shierholz 2014). The program is viewed as a viable tool but not as a sole solution to poverty due to the projected excessive governmental cost if expanded greatly (Bernstein and Shierholz 2014).

Other programs are designed to provide social protections through in-kind support for the basic needs of those living in poverty (Hoefer and Curry 2012). Preventing food insecurity and hunger is addressed through the National School Lunch Program; the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC); and the Supplemental Nutrition Assistance Program (SNAP), previously referred to as the Food Stamp Program (Hoefer and Curry 2012). Those who oppose these programs fear increased long-term dependence on government programs, reduced incentives to work, and high administrative cost while others point to the millions who would go hungry without these services and is an important role in preventing poverty (Hoefer and Curry 2012; Supplemental Nutrition Assistance Program 2016; Chung et al. 2013).

Inability to address medical cost is another common need of the poor, especially senior citizens and children and large federal programs like Medicaid, Medicare, Children's Health Insurance Program (CHIP), and the more recent Affordable Healthcare Act, which are funded by both federal and state funds (Danguerre 2011; Williams 2009; Grogan and Gusmano 2007). Other programs like the Housing Choice Voucher Program and Choice Neighbors are in place to target housing needs for the poor and encourage desegregation of concentrated areas of poverty and mixed housing solutions (Darrah and Deluca 2014; Price 2010; Kucheva 2013). In addition, the Temporary Aid to Needy Families is available to provide assistance with services to help families achieve self-sufficiency (U. S. Department of Health and Human Services 2015).

## Conclusion

There are few claims that the United States' current gumbo of policies and programs will solve the complexities faced by those living in poverty or eliminate poverty, but one clear turning point began when policy makers focused on what could be changed instead of what could not (Rose and Baumgartner 2013). Current research sites six additional ways to maximize the impact of social policies to address poverty, which includes a healthy mix of programs, maximize current technology, improved public participation, improve coordination, increased public support, and insure fiscal and political feasibility (Dasgupta 2010; Gundersen 2006; Piven and Cloward 1993; Conway and Norton 2002; Price 2010; Etzioni 1970; Williams 2009; Cellini et al. 2008). Researchers suggest that there should be a healthy mix of both economic and comprehensive social policies that provide a safety net and limits risk exposure for the poor (Dasgupta 2010; Gundersen 2006; Piven and Cloward 1993; Conway and Norton 2002). There is evidence that policies that spur economic growth have a positive impact on reducing poverty, but it must be a growth that brings viable, long-term jobs opportunities (Dasgupta 2010).

Secondly, current technology should be maximized to help tailor services and improved two-way communication and increase understanding and response to recipient's needs (Giugale 2015). In addition, benefit recipients need to feel as if they are a viable part of the solution and not simply passive recipients through effective public participation in policy development and implementation (Price 2010; Etzioni 1970). Fourthly, although difficult, improved communication and coordination between all of the stakeholders involved in delivering services and between the different types of services, to provide a more fluid and unified approach (Price 2010; Danguerre 2011). Fifthly, there is a need to improve communication with the public about the importance of social policy towards the poor and for the challenges experienced by the poor to increase policy support (Cellini et al. 2008). Finally and arguably, the most difficult, policies and programs must be both fiscally and politically feasible (Dasgupta 2010; Cellini et al. 2008). Although, there may be no sure-fire solution to the challenges of poverty, the US government has been and continues to be a powerful force in this fight that cannot be ignored, and the public attitudes, poverty measures, and policy history have played a viable role in its development (Williams 2009; Katz 1995; Edelman 2014).

# Popular Reporting

Sandra Cohen
Athens University of Economics and Business, Athens, Greece

## Synonyms

Accountability; Reporting for citizens; Transparency

## Definition

Popular reports are reports that aim at informing citizens about the financial condition of the state/local government in a convenient and friendly manner. They are expected to be concise, short in length, and present public sector accounting information in a simplified way.

## Introduction

Over the last 30 years, there have been considerable actions worldwide aiming at enhancing transparency and accountability in the public sector. Citizens and several other stakeholders are in need of having a rich array of information, in order to assess the performance and make decisions about the efficiency, effectiveness, and economy of public sector entities. Accountability in the public sector is more important than in the private sector, and it is mainly achieved through financial statements and budgeting documents. Informed citizens could be more active in democratic participation which is sine qua non in democratic polities. Within this realm new tools in public sector accounting and budgeting have been promoted and adopted in several countries all over the globe such as program budgeting, performance budgeting, accrual accounting, corporate social responsibility reports, sustainability reports and environmental reports, etc. Many studies confirm the interest of governments in providing information to citizens as a tool to restore trust and legitimation, as well as a medium to actively involve citizens in the strategic decision process. However, the success of these initiatives depends on the acceptance and understandability of reporting by the targeted stakeholders. In this realm, during the last years starting from the USA and Canada, a movement aiming at the preparation and publication of reports especially addressing citizens' profile has evolved. These reports contain easily understandable financial information regarding governmental entities and are called "popular reports". Popular reporting aims at informing citizens about the financial condition of the state/local government in a

convenient and friendly manner. Popular reports are expected to be concise, short in length, and present public sector accounting information in a simplified way (GASB 1992). All in all, popular reports are supposed to provide a less detailed overview of a government's financial activity in a comprehensive way.

In the aftermath of the financial crisis, popular reporting has become critical. Citizens in several countries, in Europe and worldwide, are witnessing significant budget cuts in several parts of public administration (e.g., local governments, health, education) and face important tax increases – but they are questioning the suitability of these measures to streamline public sector, to fight corruption and meet sustainability targets. Understanding where the flow of the public money goes, through their disclosure in popular reports, is thus expected to increase accountability, trust, acceptance, and citizens' involvement.

## Citizens' Accounting Information Needs

The primary goal of governmental financial reporting is to satisfy the information needs of numerous different users for decision-making as well as for accountability purposes. Within these different user groups which include, among others, politicians, investors and creditors, and oversight and governing bodies, citizens hold a prominent position. Citizens are identified as the most significant group of governmental financial reporting users in terms of voting power and financial assistance provided through taxes. Several public sector accounting standards-setting bodies such as the International Public Sector Accounting Standards Board (IPSASB) and the Governmental Accounting Standards Board (GASB) recognize in their conceptual frameworks that citizens are a group of users with specific interest in governmental financial reporting. Citizenry includes citizens, taxpayers, voters or service recipients, but also other stakeholders that act on behalf of citizens, who distill, digest, and communicate to citizens important information. This latter group of stakeholders would include the media (e.g., daily newspapers, magazines, all-news broadcasters). Citizens are involuntary providers of financial resources; they cannot decide whether or not to pay taxes, and there is no exchange relationship between the resources provided and the services received. Therefore they expect rational use of the available resources by management and demand accountability. Furthermore, as receivers of goods and services provided by public administrations, they also demand effective and suitable services.

Providing information to citizens in simple and easily understandable form is not something new. Ancient Athenians, mainly during Pericles Golden Age, were constantly getting informed on public money spending through public inscriptions carved in stone visible to all. To an extent, citizens were thus "made" informed by receiving easily accessible and comprehensive information.

In the USA, the Government Finance Officers Association (GFOA) is promoting the preparation of popular reports seen as a tool able to increase the understanding among citizens about the way in which a government is managed and a possible base for dialogue between elected officials and citizens. This dialogue could involve both municipal finances and public services delivery choices. In this sense the popular reporting approach seeks to bridge the gap between financial reporting that is addressed to specialists and reporting for non-specialists. However, in several cases popular reporting is rather oriented to financial information and is not structured to guarantee the inclusion of all other operational information important for democratic accountability.

The production of popular reports by public sector entities corresponds to the supply side of information. The demand side, encapsulating the actual demand stemming from the genuine interest of citizens in public sector entities' financial performance and position, is an interesting issue. Even though citizens should be concerned about public finances for a plethora of purposes, there is a general notion that the general public does not have much interest in financial statements. Empirical works have concluded that citizens appear to make limited use of governmental financial statements in practice (Lee 2006; Yusuf et al. 2013). These findings could however be reversed by

finding alternative and new ways to intrigue citizens' interest. The use of the Internet and new technologies could be supportive in this direction as discussed in the section "Popular Reporting and the Internet."

## Popular Reporting

Popular financial reports are reports distributed to citizens and other interested parties who lack a background in formal government financial reporting but who desire an overview of the government's financial status and activities. Popular reports are considered general purpose external financial reports which, however, are not structured around basic financial statements, notes to basic financial statements, and supporting information that is the typical format of these reports. Therefore, popular reports are separately issued financial reports. More specifically, popular reports are financial reports that are prepared following a concise, easy to read, comprehensive, and user-friendly manner that is mainly focusing on citizens' needs. Nevertheless, apart from citizens which constitute the cornerstone target group of popular reports, these reports could be useful for politicians, public sector employees, the media, and community groups. Therefore, they could address a rather extended audience whose members all lack expertise in accounting and financial reporting. The basic philosophy of popular reporting is the provision of a simplified view of financial statements, avoiding both the disclosure of a detailed analysis and the use of complicated technical terms making in this way the report easy to be understood by nonexperts. Even though the information included in these reports originates from the formal financial statements and the formal financial systems of the governmental entity, simplifications and aggregations are usually adopted. In this sense, popular reporting can be applied regardless of the accounting basis implemented. It would be equally applicable when an entity uses cash accounting, accrual accounting, or a modified basis of cash or accrual accounting provided that the summary financial information in the popular reports corresponds to that disclosed in the official audited accounting or budgeting statements. Additionally, in order for popular reports to satisfy the information needs of citizens, they should be published on time, have a clearly defined scope, and highlight the existence of the formal set of financial statements for those who would like to have more detailed information. Of course, those interested in getting more details or additional information could easily consult the financial reports. Although the popular reports have less technical language and provide less detailed information than the financial statements, they are expected to be credible and to present an accurate, objective picture of the governmental activity.

Popular reports would encourage citizens that are not experts in accounting to better understand the finances of the public sector and even become more interested in the public sector finances. The "making" of interested citizens is expected to lead to multiple benefits. A basic benefit would be that informed citizens might become more willing to pay their taxes. Tax and budget issues are often the focal points for citizen dissatisfaction. The main issue might not be the amount of taxes levied by several levels of government, but how tax money is spent and the suspicion that it is sometimes wasted. Popular reporting would enhance the connection between the tax collected and the services that the public sector entities provide.

The GASB published a research report, *Popular Reporting: Local Government Financial Reports to the Citizenry*, in 1992 (GASB 1992). The study described reporting practices at that time, reported on surveys and interviews with preparers of popular reports, discussed factors that should be considered when developing a popular report for citizens, and discussed and prepared a prototype popular report for use by citizens. The research report found that a wide variety of approaches to popular reporting were being used. A recent follow-up of this study has confirmed the same conclusions (Yusuf et al. 2013).

Practice so far has revealed a paradox in relation to popular reports. While many governmental entities respond to this trend and develop popular reports, they are not equally active when it comes to their dissemination to constituents (Yusuf et al.

2013). This phenomenon would have two explanations. Either that public sector entities do not have a genuine interest in being accountable and transparent or that the actual demand for these reports is not as high as it is supposed to be.

So far popular reports are mostly used by local governments. As for their role, it seems that most local governments view popular reports as a valuable tool for meeting citizens' information needs and maintaining transparency and accountability, while few view the reports as a way of gaining active citizen involvement.

## Characteristics of Popular Reports

In order for the popular reports to serve their role, that is act as suitable means of accountability and transparency and a convenient vehicle to convey financial and nonfinancial information to citizenry, they should be better developed abiding by some characteristics that could be summarized as follows:

**Financial statement reliance**: The information included in the popular reports should be extracted from the financial statements. In cases in which there are deviations from the generally accepted accounting standards, this should be clearly stated on the report. A popular report would include, among others, abbreviated operating information, abbreviated information on financial condition, explanation of commitments and expenditure on major capital improvements, debt position, and explanation of major changes in revenues and expenditures.

**Timeliness**. Popular reports should present information in a timely manner in order to be relevant. For this reason, their publication should take place close to the end of the period they correspond to. For example, they should be released no later than a few months after the end of the fiscal year they refer to.

**Defined scope**. There should be a clear description to what is included and discussed in the report and a clear path to getting more information from the official financial statements for those interested in formal general purpose financial statements.

**Understandability**. The information in popular reports should be accompanied by comparative data (e.g., trends and benchmarks) as well as visual aids that facilitate comprehension. For example, photographs and drawings appeal to readers and reinforce the topics being discussed (e.g., illustrations of capital improvements give meaning to a discussion of construction costs, and photographs can present very lively damage and deterioration). The text should be simple, clear, and concise. Issues of particular importance should be highlighted and explained. The use of technical language and jargon should be avoided. However, it has to be noted that adopting a simple writing style is not easy for preparers who think in technical accounting language.

**Suitable dissemination**. The public sector entity should have a clear dissemination policy in order for the popular reports to reach the interested/target audience. Several means would be employed for this purpose (hard copies, electronic copies, web pages, etc.). Preparers should also provide incentives to encourage citizens to read these reports.

**Credibility**. The popular reports should present information in a balanced and objective manner. This is of utmost importance as the entire process of preparing a popular report starting from the choice of topics to be discussed to the tone used in the text is subject to bias. Also the fact that the popular reports are not audited and that they use simplified accounting terminology intensifies the need to be as objective as possible. It is important for these documents not to end up being public relations documents. To this end, they should cover both favorable and unfavorable trends and should discuss both successes and problems.

The characteristics discussed above are broadly in line with what has been discussed in GASB (1992), Sharp et al. (1998), GFOA (2006, 2007) and Clay (2008). It has to be noted that there are no specific rules and norms for developing popular reports. There are only best practice recommendations. The lack of formal guidelines has resulted in the phenomenon of the popular reports developed in practice exhibiting significant heterogeneity.

The Government Finance Officers Association (GFOA) established in 1991 the Popular Annual Financial Reporting Awards Program (PAFR Program) to encourage and assist state and local governments to extract information from their comprehensive annual financial report (that is produced according to generally accepted accounting principles) to produce high-quality popular annual financial reports. These reports should be specifically designed to be readily accessible and easily understandable to the general public and other interested parties without a background in public finance. GFOA recognizes individual governments that are successful in achieving that goal and awards them (http://www.gfoa.org/pafr).

## Popular Reporting and the Internet

The Internet is an ideal mean to host and promote popular reports. As popular reports are usually accompanied by graphic presentations, the use of the Internet that can easily host color graphs is recommended. The presentation of the financial information disclosed in popular reports with the aid of ICT (information and communications technology) and not through traditional hard copy or even pdf reports makes the presentation of the information more relevant to contemporary practice. However, this vehicle of dissemination would require additional effort in order for the reports to be created, especially if they were to be developed and presented in an interactive way. For example, a web-based interactive tool would be developed to present information in a user-friendly, expandable manner (i.e., from general information to more analytical information) according to the users' requests. Nevertheless, the use of the Internet for popular reporting is expected to have multiple benefits in several fronts. Firstly, the information would be available to citizens at any time, bypassing the dependence on coverage by the news media. Secondly, it would decrease the cost of dissemination by achieving savings in printing costs, paper consumption, and maintenance of mailing lists (Lee 2006).

While popular reports refer and are linked to the published financial statements and they are static, there is a new trend, that has been evident recently, of public sector entities sharing financial and nonfinancial information through open data means. In this way, the information presented to the public is up-to-date and can get to a low level of detail, while the user is able to have access to multiple comparisons and select only the information that is of interest. Within this realm there is a recent emphasis on websites geared toward enhancing transparency by providing information on government expenditures, revenues, etc. Several such datasets that have become flagship initiatives of open government and open data strategies aim at increasing transparency for public official's accountability (Lourenço 2013).

### Popular Reporting and Integrated Reporting

A recent idea that has been proposed in literature is a synthesis of integrated reporting and popular reporting (Cohen and Karatzimas 2015). The proposed scheme named integrated popular reporting is a synthesis under which popular reports are enhanced to include basic and necessary information regarding public sector entity's well-being, prosperity, and value creation. The goal is for the reports to provide a holistic, useful, and meaningful information set in an easily comprehensible and attractive manner. In this way, citizens would be encouraged to engage in public matters with simply presented information, while in parallel, the reporting entity would fulfill its reporting obligations, by providing a "holistic" picture of its status to citizens according to the integrated reporting concept.

## Conclusions

Popular reports are reports containing financial and nonfinancial information regarding governmental entities presented in a concise, convenient, user-friendly, nontechnical language that have the citizens as their primary target audience.

However, while popular reports are expected to enhance accountability and transparency of public sector entities and mobilize the interest and the

involvement of citizens, they seem not to have exploited their full potential yet. Their significance in normative terms is non-questionable, but the way citizens are getting access to public sector entities' financial and nonfinancial information might be improved. Toward this end more studies are needed in order to clarify the actual information needs of the citizens not only regarding their content but also in presentation form, frequency, and dissemination means. Last but not least, the use of modern technology and the Internet would boost citizens' interest in popular reporting.

## Synonyms

Africa; Development; Elections; Electoral violence; Political vigilantism

## Definitions

Elections — They involve a formal group decision-making process, a means through which a group chooses an individual(s) to hold formal office mostly public in nature. Elections are usually very competitive in nature and have been the main mechanism through which modern representative democracy operates. Ideally, the processes before, during, and after should be in

| | |
|---|---|
| | a free and fair manner devoid of intimidation and violence. |
| Electoral violence | It entails coercive force, directed toward electoral actors and/or objects, that occurs in the context of electoral competition – it can occur before, during, or after elections, and it can target a variety of actors, including candidates, activists, poll workers, election observers, journalists, and voters (Birch and Muchlinski 2017), and electoral materials. |
| Political vigilante | It is an ad hoc or organized group of people mobilized for the purposes of applying unauthorized means and power ostensibly to enforce order or to intimidate and attack a person(s) or group and properties before, during and after elections or any activity/person that has political relatedness. Political vigilante groups usually cause electoral violence and also perpetrate other security-impeding acts which may not be election related but political in nature. |

## Introduction

Violence and political vigilantism in the governance process and electoral system in Africa are a problem which requires a more robust solution. For instance, the violent vigilantism of the Bakassi Boys in Nigeria which is blatantly uncivil in its modus operandi reveals convolutions and illogicality which typify the ungoverned space of political organization and imagination in many political processes and elections in Africa. We conceptualize political vigilantism to involve *an* ad hoc *or standing mobilization of people for the purposes of the application of unauthorized means and power ostensibly to enforce order or to intimidate and attack a person(s) or group and properties before, during, and after elections or any activity/person that has political relatedness.* The menace of political vigilantism is not endemic to Nigeria but in many parts of Africa (Smith 2004). The literature reports similar phenomenon in Cameroon (see Argenti 1998; Malaquais 2001), in Kenya (see Anderson 2002), and in South Africa (see Baker 2002; Haysom 1990). While the above countries are renowned for their political vigilantism, there is a general perception that Ghana has achieved remarkable success in democratic consolidation by conducting seven general elections in the Fourth Republic without widespread violence since 1992.

Despite the growing improvements in its electoral processes over time, what remains problematic is the security aspect and growing trend of electorally related violence which is exhibited in the political space by the two main political parties (NPP and NDC). Researchers (Asamoah et al. 2014) have noted that although Ghana has made remarkable gains in democratic elections, the electoral processes, however, come with intense tensions and acrimonies. Over time, a phenomenon which is sophisticatedly gaining roots in Ghana is the canker of political vigilantism. This is a trend which requires urgent attention since it has implications on the security of the country and its democracy. In a post-mortem report of the 2016 Presidential and Parliamentary elections, the Coalition of Domestic Election Observers (CODEO) among other things cited isolated cases of acts of violence purportedly committed by certain individuals and groups within the New Patriotic Party (NPP) against some supporters of the National Democratic Congress (NDC), amidst counter-accusations. Additionally, in its communiqué which was released in April 2017, CODEO described as awkward with regard to the increasing spate in the activities of vigilante groups and fingered the two major political parties, the NPP and NDC, as culpable. The activities of these groups pose a considerable danger to Ghana's electoral politics, democratic governance, and development (CODEO 2017). What is noteworthy is how vigilante activities have bedevilled almost all the relevant Parliamentary by-elections in Ghana's post new millennium era. For instance, there was a recent Rambo-style political vigilantism (apparently with some support from the NPP-led government) (https://www.myjoyonline.com/politics/2019/February-1st/undp-condemns-ayawaso-west-wuogon-bye-election-violence.php) in an Ayawaso West

Wuogen by-election in Accra which led to the inauguration of an Emile Short Commission to probe into the issue. A group in the NPP also made a call for similar commissions to take a retrospective investigation of the electoral violence which had taken place in Asunafo, Asutifi, Talensi, Chereponi, and other by-elections in recent past. This is to indicate that violence and political vigilantism have become rife in Ghana's political landscape and both NPP and NDC are culpable.

In what appears to be the government's commitment to addressing the canker, the NPP-led government through some stakeholder deliberations sought ideas and opinions to initiate legislation against the issue. Consequently, the Parliament of Ghana passed the Vigilantism and Related Offences Bill in 2019 (later withdrawn for correction) which prima facie may suggest a steady commitment to the issue and addressing political vigilantism. However, in Ghana, many laws are well formulated, yet the implementation becomes problematic which in many cases are due to "claw-backing" or calculus machinations to render the implementation structure deactivated to get perpetrators off the hook even though the laws prevail in the books (Yeboah-Assiamah and Alesu-Dordzi 2016). Some analysts believe this law may suffer a similar fate, and it is just to whitewash atrocities which occurred in the 2019 Ayawaso by-elections. Before the Act finally gets passed and enforced, it is imperative to assess how Ghanaians view political vigilantism which will guide policymakers and implementers on how serious they take the issue.

In spite of the growing spate of political vigilantism in the electoral processes of many African political systems, the political science literature has not been swift to systematically assess this all-important phenomenon. There are, however, pockets of studies that tend to assess the phenomenon from some perspectives. For instance, Gyampo (2010) discusses some issues of party apparatchiks in Ghanaian politics. The literature also discusses the drivers of vigilantism in Ghanaian politics (Gyampo et al. 2017). The extant literature, however, is yet to sample the views of the electorate on vigilantism as well as how best to address the phenomenon. This presents a research gap which requires systematic enquiry through opinion survey and triangulation with secondary data to contribute to knowledge in that space. The main objective of the study is to discuss the views and thoughts of Ghanaian electorate on political vigilantism through the lens of "group" and "political system" frameworks which are useful tools for political and public policy analysis. The study seeks to provide answers to these three key questions: *(i) What is the extent of popular support for political vigilantism? (ii) Would the electorate support state policies and institutions that attempt to clamp down on vigilante activities? (iii) Is there any qualitative (*prima facie*) relationship between level of education and support for anti-political vigilante policies?* The study is organized into five main sections. Beyond this introduction section, the second section discusses the group model of policymaking which frames the study. The section also provides a conceptual overview of political vigilantism. Section three presents the study design and sources of data. The section also provides a sketch overview of vigilantism activities and those activities prompting the government to decide to legislate on the problem. The section presents data findings and provides analysis through descriptive figures and diagrams. Section four provides an adequate discussion of the study findings, and key insights are derived. The final chapter provides conclusions and policy implications from the study.

## Theoretical Framework

### Group Model of Politics, Policymaking, and Implementation

The group model is a useful tool for understanding political processes and public policy analysis. The model contends that public policy is the product of the "group struggle" in society. This point has forcefully been argued by Anderson (1997) that many public policies do reflect the contentions of groups. What may subsequently emerge as public policy is the equilibrium

reached in this group struggle at any point in time. The competing groups or interests repetitively strive to push policy in their favor. Individuals remain relevant in political discourse insofar as they represent a group interest or act as part of or on behalf of a group and not in individual capacities.

The central role of the state or government is to establish "rules of the game" to help arrive at compromises and/or balancing of interests through policies and laws (Sabatier and Mazmanian 1979). The group theory of public policy denotes that policies are outcomes of the group struggle and, all things being equal, policies go in favor of the group that is more dominant at a time (see Fig. 1) with respect to time. The tendency for a group to gain dominance and influence hinges on group size and numbers; resources including finances; organizational strength, cohesion, and mobilization prowess; and leadership quality and access to policymakers.

The group model posits that policymakers respond to group pressure by bargaining, negotiating, and compromising among competing demands (Gilens and Page 2014). Depending on the nature of demands, agitations, pressures, and lobbying activities of a group, policies may tilt in favor of such group in the meantime. In Fig. 1, the influence of Group A is enormous, and so the equilibrium is on the side of A because B's influence is far less as compared to A.

Deploying the group model to the current study with respect to political vigilantism, there are at least two broader groups, the interested political parties on the one hand and citizenry including civil society and media on the other hand. In as much as resorting to political vigilantism may enure to the benefit of the two main political parties (NPP and NDC), the greater citizenry and society greatly detest such acts of political vigilantism. As such the activities of the latter group, through their public condemnation, organizational prowess, and lobbying, have compelled the state to commit to legislation. Whether born out of goodwill or "business as usual" (see Yeboah-Assiamah and Alesu-Dordzi 2016), it is quintessential for the state or government to empirically ascertain the strength of groups that oppose such acts of political vigilantism. A defining characteristic of politics is the struggle for power, maintenance of power, and its usage; hence, political parties remain resolute to the popular demand at a time in order to secure or maintain political power for the public interest especially, in a competitive democracy.

In this paper, a survey report on the views of the Ghanaian electorate regarding political vigilantism is presented and discussed which we believe should drive the steady and prudent enforcement of relevant institutions to address political vigilantism.

## Conceptualizing Political Vigilantism

Political vigilantism has been conceptualized by Gyampo et al. (2017) to mean "a form of social group-controlled violence or activism, which

**Popular Support for Public Policies to Curb Political Vigilantism: Reflections from Ghanaian Electorate, Fig. 1** Group model. (The group model assumes that public policy is an outcome of interest group influence; policies change when particular interest groups gain or lose influence)

P

serves the political interest of both an incumbent government and the opposition since both incumbent government and the opposition have their vigilante groups" (p. 115).

For the purpose of this study, we define political vigilantism to denote *an* ad hoc *or organized group of people mobilized for the purposes of applying unauthorized means and power ostensibly to enforce order or to intimidate and attack a person(s) or group and properties, before, during, and after electoral processes or any activity/person that has political relatedness.*

The tendency for political vigilantism may emerge where there is a perception of "ungoverned spaces" or vacuum in the overall reach of the state and its security apparatus. Perhaps there is nothing which embodies the disillusionments of democratic principles more than "the all-consuming public concern that crime is rampant and out of control."

To rise above those feelings of insecurity and perceived dysfunctions in government, violent vigilante groups emerge in different areas (Gore and Pratten 2003; Ikelegbe 2001). The literature (see Abrahams 1996) through historical and cross-country analysis affirms that vigilantism has become a common reaction to uncertainties and incongruity with regard to the authority of the state, especially, in the provision of professional and neutral security to all manner of people. On the other hand, vigilantism may also proliferate when people or a group are convinced that the rules or systems are not robust enough to penalize them even when apprehended.

## Envisaging Robust Political Systems: World Governance Indicators

In its quest to promoting more robust political systems world over, the World Bank has adopted some indicators to benchmark the effectiveness of how governments steer the affairs of the state and political institutions. These benchmarks have become known as the "World Governance Indicators" which among other things measure the extent to which a state is more effective and capable of enforcing rules and regulations to safeguard the integrity of political institutions and protection of individual liberties and private properties. These are illustrated in Box 1.

**Box 1 World Governance Indicators. Source: World Bank 2018**

- *Voice and accountability*: This measures perceptions of the extent to which a country's citizens are empowered or allowed to participate in the selection of their governments and leaders. It involves commonly held liberties such as freedom of expression, freedom of association, and free media. This should be applicable to all citizens.
- *Political stability and absence of violence/terrorism*: This measures perceptions of the possibility that the government will be subverted or overthrown by unconstitutional or violent means, including politically motivated violence and terrorism.
- *Government effectiveness*: This measures perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the political will of government to remain committed to enforcing such policies in an impartial and fair manner.
- *Regulatory quality*: This measures perceptions of the ability of governments to formulate and implement sound policies and regulations that permit and promote private sector development. This also involves the level of respect of citizens and the state for the institutions that govern economic and social interactions among them. In other words, to what extent do the state and its institutions through policies safeguard individual liberties?
- *Rule of law*: This measures perceptions of the extent to which people and agents have confidence in and abide by the rules of society, and in particular the quality of

(continued)

**Box 1 World Governance Indicators. Source: World Bank 2018** (continued)

contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence. This remains very essential because if it breaks down, an ungoverned space emerges and people may resort to other unorthodox means to protect themselves.

- *Control of corruption:* This measures the perceptions of the extent to which public power is prudently deployed for public interest and not exercised for private gains, including petty and grand forms of corruption, as well as "capture" of the state by elites and private interests.

## Methodology

### Design

The study adopted content analysis of secondary data and relevant materials sourced from the Afrobarometer survey of 2018 which assesses the worldview of Ghanaians on political vigilantism. Sample which was nationally representative of adult citizens, thus from age 18 and above, was used, and all the respondents were randomly selected from all then ten regions of Ghana. The sample used was distributed across regions and urban-rural areas in proportion to their share in the national population. A sample size of 2400 respondents was selected with a margin of error of ±2% at a 95% confidence level was used. Again, the 2400 respondents were located in 300 Enumeration Areas (EAs) spread across 293 towns in 171 districts in the then 10 regions of Ghana. Other data were gathered from online source. Data is analyzed and illustrated through simple bar graphs and pie charts which provide an overview of people's thoughts displayed in frequencies. The use of bar and pie charts is to help give a quick visual impressions and to ascertain the dominant worldview.

## Brief Overview of Recent Political Vigilantism Activities in Ghana

**An Escalating Pattern of Political Intolerance and Violence**

What existed as use of vitriolic language in politics, through an era of well-built men (macho men) to secure ballot boxes and intimidate opponents, has grown to assume a more sophisticated and heightened level of impunity in different parts of the country.

In March 2017, a greater number of Delta Force members (a vigilante group linked to the ruling NPP government) attacked a regional government building in Kumasi to forcefully oust a senior government officer. Ghanaians became shocked when members of the Delta Force stormed a court to free 13 of their members standing trial for the assault (https://www.ghanaweb.com/GhanaHomePage/NewsArchive/NPP-Delta-force-storms-Kumasi-court-frees-13-suspects-526326).

The Delta Force is just one of a handful of groups responsible for commandeering public facilities since New Patriotic Party (NPP) leader Nana Akufo-Addo won December's presidential polls.

Vigilante groups campaign for and also provide informal security to secure their party's interests even at the perils of their lives. Members of these groups are assured of ready jobs upon the party winning elections and assuming reins of government. If these expectations are not met, desperation sets in, and they begin to cause mayhem even against their own political party leaders. For example, in 2017 the President Nana Addo Dankwa Akufo-Addo appointed George Agyei [an individual the Delta Force vigilante group claimed had not been part of the struggle to win election] as regional security coordinator for the Ashanti Region. This infuriated the vigilante group whose members became so apprehensive to the extent of marching

into the appointee of the president's office to assault and forcibly oust him. When the embattled Delta Force members were put on trial, fellow members entered the court and forcibly freed their members on trial in the courtroom.

**General Condemnation from Internal and External Groups**

The Coalition for Domestic Election Observers (CODEO) condemned the hefty presence of security personnel and masked officers at various polling centers in the Ayawaso West Wuogon by-election which they said generated a terrifying atmosphere which would make electorate scared to come out to cast their votes.

The National Commission for Civic Education (NCCE) also condemned the alleged violent attacks during the by-election. The Commission condemned the growing political party thuggery in Ghana's electoral and political processes as a threat to the country's democratic gains and its peace and security.

Mohamed Ibn Chambas, head of the UN Office for West Africa and the Sahel, said the Delta Force group was acting with "impunity" following the 2016 election.

**Breaking the Camelback: Decision to Legislate**

Although almost all by-elections in the Fourth Republic have experienced some forms of violence, the incident which broke the camel's back was the fall out of the Ayawaso West Wuogon by-election of 2019 which experienced a heightened form of political vigilantism with gross impunity which has seen greatest condemnation from different actors and groups.

With the aftermath of violence in the Ayawaso by-election, the UNDP in a statement signed by its resident representative Ms. Gita Welch stated ". . .we strongly condemn such impunity and brazen acts of violence which undermine Ghana's hard-earned democracy and peace. Ghana as a pillar of stability in the sub-region must not become complacent. We call on all to avoid violence and the use of inflammatory language that could further increase tension (https://www.myjoyonline.com/politics/2019/February-1st/undp-condemns-ayawaso-west-wuogon-bye-election-violence.php)."

Addressing Parliament in a third State of the Nation Address on Thursday, February 21, 2019, the President of the Republic put it "I have asked the leadership of the NPP (then party in government) to extend an invitation to the leadership of the NDC (then party in opposition) for such a meeting on vigilantism. He said, "the security services of the country will be on standby to assist this meeting. If voluntary disbandment by the parties is not feasible, then I will initiate legislation on the matter" (http://www.ghana.gov.gh/index.php/media-center/news/5417-president-akufo-addo-initiates-dialogue-on-vigilantism).

## Results and Discussions

The study sought to assess the dispositions of Ghanaians toward political vigilantism, their perceptions, and how such social menace should be dealt with. Data is presented and analyzed along the three key research objectives that underpin the study. Consequently, the section is organized along these themes: *extent of popular support for political vigilantism*; *extent of popular support for public policies and institutions to clamp down vigilante activities*; and *level of education and support for anti-political vigilante policies.*

From the Afrobarometer Survey data of 2018, insights relevant to the disposition of Ghanaians on political vigilantism have been extracted and discussed in themes below.

## Extent of Popular Support for Political Vigilantism

The first objective was to ascertain from the electorate the extent to which they sympathize or solidarize with actors who engage in acts of political vigilantism. In other words, the study sought to obtain a fair idea of whether there is popular support for political vigilantism. Three key questions posed to respondents have been used to discuss this objective.

### Appropriate for Groups to Attack Government Officials?

There may be some general mixed feelings that may surround the appointment of particular government officials or on their performance in public office. Thus, people may express or demonstrate their displeasure through different medium including open protests and lobbying for such officials to be relieved of their positions. That notwithstanding, civil Ghanaians do not have a culture of forcibly ousting a government official from office by an unauthorized group of people. Ghanaians have been regarded as tolerant people with a culture of respect for authority and structure. This is given support by an Afrobarometer Report (2018) where a greatest majority of Ghanaians treat the attacks on government officials with contempt and in essence register their disgust for such activities of political vigilantes and irate youth. Respondents scorn people who take the laws into their own hands to attack public officials in either their offices or residence to compel them out of station.

Respondents were asked *whether it is appropriate for vigilante groups to attack appointees of the government*. The response to this question has been illustrated in the Fig. 2.

Majority of respondents eighty-eight percent (88%) regard the act as "wrong and punishable," six percent (6%) believe it is wrong but understandable, and two percent (2%) believe it is not wrong at all, while the remaining four percent (4%) do not know whether or not it is wrong for political party vigilante groups to attack government appointees whose appointment they disagree with. Essentially, at least 94% of respondents support the state to clamp down the activities of vigilantism. Stemming from the above, it could be argued that majority of the people of Ghana abhor the phenomenon of political vigilantism and would like the law and its enforcement agencies to punish perpetrators without fear or favor.

### Disgruntled Youth Justified Locking Up Government Offices?

Many politicians may ride on the back of unemployed youth who are promised jobs which in most cases entices them to go all out even at the peril of their lives before and during elections. There after, when power is finally attained, the youth have higher expectations with a high sense of entitlements, and they become disillusioned when the

**Popular Support for Public Policies to Curb Political Vigilantism: Reflections from Ghanaian Electorate, Fig. 2** Is it right for political vigilantes to attack government officials? (Source: Afrobarometer Report 2018)

initial promises appear to be delaying or a mirage. At times, to register their displeasure for any decision by their government (https://www.ghanaweb.com/GhanaHomePage/NewsArchive/NDC-youth-on-rampage-lock-down-DCE-s-office-331241), they may react by locking up state facilities and government offices (https://www.myjoyonline.com/politics/2019/June-17th/tamale-npp-boys-lock-up-national-sports-authority-office.php).

Respondents were asked whether disgruntled political party members who perhaps were promised jobs or are not happy with government decisions are justified to lock up government offices as a form of protest. From the survey, the results are illustrated in Fig. 3.

From Fig. 3, a large number of citizens, eighty-seven (87%), believe it is "wrong and punishable" for political party vigilante groups, whose employment expectations have not been met after election victory, to lock up government offices. However, seven percent (7%) believed it is wrong but understandable, two percent (2%) believe it is not wrong at all, and four percent (4%) have no knowledge about it. Judging from the afore, it can be said that members of political party vigilante groups locking up government offices because their expectations of getting employment with those institutions are not met is something loathed by Ghanaians and they think offenders should be prosecuted to serve as a deterrent to others. Be as it may, a greater majority of Ghanaians do not subscribe to such acts of impunity and are likely to support the government to deal with such ruthless acts.

### Seizure and Destruction of State Properties?

On seizure and destruction of state properties by disgruntled political party members or groups, an overwhelming majority, ninety-one percent (91%), indicate that it is wrong and punishable for political vigilante groups to take over and destroy state properties such as offices, toll booths, public toilets, and car parks among others. While a majority of the people expressed worry about the issue of vigilantism, four percent (4%) were of the view that it is wrong but understandable, one percent (1%) believed it is not wrong at all, and four percent (4%) expressed no knowledge about it. Ransacking public property, be it public toilets, toll booths, or district assemblies, is a thing that Ghanaians want the law to punish and think it is not acceptable in a growing democracy. The result is illustrated in Fig. 4.

## Popular Support for Institutions to Clamp Down on Vigilante Activities

The second objective of this study was to discuss the level of support that the environment provides for state policies, laws, and actions that are geared toward sanctioning perpetrators of political vigilantism. Respondents were quizzed: ***Is it appropriate to prosecute and sanction political vigilante members who trespass?***

Usually, people argue that political affiliation appears to endorse or give room for wrongdoing; however, a majority of fifty-five percent (55%) of the respondents strongly approve the prosecution and punishment of political party vigilante groups for lawlessness irrespective of party affiliation. Twenty-nine percent (29%) approved of it, three

**Popular Support for Public Policies to Curb Political Vigilantism: Reflections from Ghanaian Electorate, Fig. 3** Is it right for disgruntled party supporters to lock up government offices?

percent (3%) strongly disapprove, four percent (4%) disapprove, and three percent (3%) don't know, while two percent (2%) neither approved nor disapproved the prosecution of lawless vigilante groups. Regardless of political affiliation, a cumulative 88% of respondents at least disapprove of such acts and regard them as a crime for which they would expect the law to punish culprits. Seven percent (7%) on the other hand disapprove punishing vigilante offenders, while five percent (5%) appear undecided. This is illustrated in Fig. 5.

### Level of Formal Education and Support for Government to Deal with Political Vigilantism

It is worthy to note that, regardless of the educational background of respondents, they still want people involved in vigilantism to be prosecuted. This is illustrated in Fig. 6. The percentage demanding prosecution of political party vigilante groups for their crimes, to some extent, rises with the level of education, no education, eighty percent (80%); primary, eighty-eight percent (88%); secondary, ninety-one percent (91%); and postsecondary or tertiary, eighty-nine percent (89%), and the national average is eighty-eight percent (88%). Though it can be observed that there was a percentage drop from secondary level to the postsecondary level, the national average is eighty-eight percent (88%) which is an indication that the grounds appear fertile for government to clamp down political vigilantism.

## Insights and Discussion

From the study and data analysis, key insights have been derived which remain crucial in all political considerations and public policy decisions that government wants to embark.

### Political Vigilantism Greatly Scorned by Ghanaians

The data presents a clear majority support for any government action that genuinely supports the clamping down on vigilante groups and their activities. Essentially, the majority of Ghanaians will "praise sing" a political party that demonstrates a commitment to ending political vigilantism. From the survey data above, it is clear the majority of Ghanaians detest the idea of political vigilantism and any government on any good day should be determined to address the canker head-on through public policy. Addressing political vigilantism requires institutional and structural reforms which will empower the state agencies to be more independent, neutral, and professional without fear or favor. To Sabatier and Mazmanian (1979), a critical task of policy implementation analysis ought to ascertain the factors that may affect the achievement of statutory objectives throughout this entire process, and those could be classified into three general categories: *(a) the tractability of the problem(s) being addressed by the statute*; *(b) the ability of the statute to favorably structure the implementation process*; and *(c) the net effect of a variety of "political" variables on the balance of support for statutory objectives.*

The study provides that there is greater support for any legislation that will genuinely seek to address political vigilantism; it is, however, important for policymakers to structure the legislation such that it will favor the implementation process and not frustrate it.

### Support to Clamp Down Generally Highest with Secondary Education

The data suggests that support for the government to clamp down activities of political vigilante groups increases with level of education and highest (91%) among Ghanaians with high school education. This study confirms a similar observation by Apergis (2018) who through economic modelling of data on education and democracy through a comparative assessment detected "the presence of democracy dividend driven by education." Similarly, Shafiq (2010) observes that secondary education and beyond provide support for democracy in Jordan, Lebanon, and Pakistan, thus supporting that democracy is a social benefit of education. This is an indication that an intensification of people's access to secondary education in Ghana through the government's Free Senior

High School Education Policy will help in no small way in enlightening the majority of Ghanaians who will have a deeper understanding of development politics and support for state policies on development management.

### Political Communication to Derive Political Currency and Benefits

Through effective political communication and marketing (see Norris 2015), political party or government in power can generate electoral currency (political points) by bringing about genuine structural retooling that will reduce the strict grips of the executive arm on the very institutions of state which require some leverage to effectively fight political vigilantism. This is against a backdrop that the group model of politics and policy process reiterates the role of dominant groups in influencing the policy process. A political party in government with a commitment to genuinely address such menace dances to the tune of the majority of well-meaning Ghanaians (at least 88%) and civil society groups which, all things being equal, should generate some support from the environment. In his political system model (see Fig. 7), David Easton (1953) posits that inputs such as pressures from citizenry and CSOs are presented as petitions to policymakers (institutional arena) and it is the role of the government and state institutions to process these demands into policy outputs. Therefore, if a clear majority of the citizenry (88%) dislike a phenomenon and appropriate policy instruments are enacted to address such issue, such policy response will feed into the political system in the form of "support." This form of support enhances the legitimacy of government which could be further developed to translate into many other fortunes including securing grants, garnering moral suasion for different purposes, and possible electoral fortunes among others (see Lees-Marshment 2014).

### Development Politics and Local Economic Development to Address Problem

The findings of the study reiterate the need for political actors to reorient themselves and adopt the idea of development politics whose central pillar rests on issues of economic, social, and human development. In that regard, the struggle for political power will be centered on development issues and not the use of "thuggery," intimidation, and violence to capture political power where those same violent elements will become a monster to haunt the ensuing government after the elections. More importantly, the study underscores the need to intensify economic transformation to empower many Ghanaians economically which will further consolidate their general peaceful loving culture. Essentially, majority of

**Popular Support for Public Policies to Curb Political Vigilantism: Reflections from Ghanaian Electorate, Fig. 7** The political system model. (Source: Easton 1953)

respondents treat with contempt the activities of vigilante groups and violence; this suggests that the few who appear affirmative may only think so due to their economic situations and the lack of economic opportunities which the youth are always promised of during elections and only become disappointed when the party wins power. Given right economic opportunities, there is more likely to be a general dislike for vigilantism, and the source/supply factor will reduce.

## Conclusion and Policy Implications

Many activities of political vigilante groups could be viewed as *civil coup d'etats* because government offices and personnel are by extension elements of the state and any use of unorthodox or unconstitutional means to topple such entities is in a broader sense an attack on the state authority. To summarily attempt to cut the tenure of office of a legally appointed or elected individual or to lock down a public office to prevent it from performing legally mandated duties could be regarded as a civil *coup d'etat* since it is an attempt to usurp the powers of the state.

The Government of Ghana upon noticing the growing condemnation of activities of political vigilantism by many actors and the general citizenry has attempted to address it via new legislation. From hindsight, this is laudable, yet experiences suggest that it is not legislation per se that addresses such social and political problems but a demonstration of political will to render the enforcement process very viable and well resourced, given adequate autonomy to act professionally without the long arm of the politician pulling strings from the other end. There could be legislations where the long title of the Act appears very promising yet in the details are provisions that will only "clawback" the very powers to the long arm of politicians and such kind of legislation will only result in the "calculus of legislation" where enactments only appear in the books and implementation agencies are unable to professionally and impartially apply them and are only selectively deployed as and when politicians deem fit.

To address the political vigilante menace, the study argues for strong political will. Political will has been cited as a major factor that affects many policies especially those that will reduce the inherent powers of the executive (CIVICUS 2007, p. 4). In Participatory Governance Programme assessing impediments to participatory governance using 250 practitioners from around the world, lack of political will outranks other variables such as follows: inadequate knowledge and skills, limited citizen capacity, a disabling political/policy environment, and lack of access to public information. The fight against political vigilantism requires adequate political will that should move beyond intent and motivation to the subsequent forging of tangible actions to make the intentions of government really reflect our motives. It is only through this act that leaders could be seen as exhibiting strong political will, making pronouncements and crafting institutions is just one aspect that is intangible and making sure that the institutions are applied and seeing to their end is tangible. For instance, Williams uses a classic case of the Zambian leadership code, which he described as quite convincing in the books, yet it was only for symbolic purpose without any tangible or material cost and benefit in terms of serving as a deterrent to corruption, because there have "never been any prosecutions under its provisions" (Williams 1987, p. 111). Merely using institutions as a smokescreen to whitewash or buy time does not help anybody. As an activity, countries should make the transaction very costly so as to reduce the participants or people who patronize it. Society must frown on political actors who establish, nurture, and encourage political vigilante groups because they put the safety and security of the people and state on a rough road. Demand side of accountability should be on the rise; role of the media and mobilized civil societies should stand up for the right of the less privileged; it is a moral duty and natural right to demand accountability by throwing sunshine on the activities of political actors.

Finally, the study argues for prudent enforcement of rules in a professional and impartial manner which will make opposition parties gain assurance in the political system.

# Population Ecology Theory of Organizations

Michael R. Ford
University of Wisconsin-Oshkosh,
Oshkosh, WI, USA

## Synonyms

Community ecology; Ecological perspective

## Definition

The study of dynamic changes within organizations.

## Introduction

Much of the history of the field of public and nonprofit administration organizations were studied internally in order to answer pressing public and nonprofit management questions. Relevant research topics included bureaucratic structures, group dynamics, and the decision-making process within organizations. The normative goals of organizational theory were to find ways to manipulate structures, group dynamics, and decision-making processes in order to improve organizational performance. The contextual questions in organizational theory tended to focus on the interaction between administrative actors and political actors, issues of regulation, changing policy preferences, and revenue streams. However, scholars like Paul Peterson (1981), Vincent Ostrom (2011), and E.S. Savas (2000) called attention to the varying ways in which local government and nongovernment organizations impact one another. Though Peterson, Ostrom, and Savas did not specifically touch on population ecology, their insights into governments and networks reflect a recognition that understanding public and nonprofit organizations requires studying both their internal environments and their external environments. The organizations comprising the public and nonprofit sector do not operate in a vacuum but rather as part of a larger organizational ecosystem.

### What Is Population Ecology?

The basic premise of population ecology is that the environment (or marketplace) in which an organization exists affects that organization's operations and trajectory in predictable ways. Michael Hannan and John Freeman (1977) authored the first seminal piece on the subject, in which they challenged the dominant unit of analysis guiding organizational theory, i.e., the organization itself. Instead, they advocated a population ecology approach that uses the entire population of organizations as the unit of analysis. This approach informs several theoretical propositions that continue to guide empirical studies of public and nonprofit organizations.

The first theory is isomorphism, which refers to the belief that organizations operating in a common marketplace begin to resemble one another over time. In order to effectively study isomorphism, and really any of the dominant theories used in population ecology, longitudinal data is needed. The underlying supposition of isomorphism theory is that common goals, regulations, and customers naturally lead to organizations in common populations resembling one other. For example, nonprofit charter schools theoretically have unique offerings to attract parents, but nonetheless begin to resemble one another over time due to their high dependence on government funding, common regulatory frameworks, and participation and membership in common advocacy networks.

The second theory is competition theory, which states that organizations in a common marketplace can be understood primarily by how they compete with one another for customers and resources. Municipal taxation policies and economic development approaches could be understood through competition theory, i.e., municipalities set policies to attract residents. In the nonprofit sector, competition theory could be used to explain service offerings and grant-seeking behaviors.

The third theory is niche theory, in which organizations are assumed to seek out new space in which to reach an underserved population. Thus, the current level of services offered by existing organizations, as well as consumer need, can be used to predict why an organization is created or decides to offer a new service (Amburgey and Rao 1996). A theoretical government example might include the decision to build a new public pool in a suburb within a metropolitan area. Under niche theory the local government in question would determine that there is a demand for a public pool in the region and hence choose to build one

in reaction to other local governments' failures to do so. The government identified an area it could be a niche provider and took action to fill that niche.

The fourth theory refers to the issue of public legitimacy. Ford and Andersson (2016) utilize this approach in their study of the lifecycle of private voucher schools in Milwaukee, speculating that the quick failure rate of many entrepreneurial private schools is a result of their failure to gain legitimacy in the eyes of parents. Studies premised on questions of public legitimacy rely on external stakeholder perceptions of a public or nonprofit organization. In other words, the fate of an organization is determined by external actor's willingness to grant legitimacy to their operations, rather than the quality of that organization's internal operations.

The fifth theory is inertia theory. Hannan and Freeman (1984) and Betton and Dess (1985) both cite inertia as a key principle guiding population ecology research. Inertia could arguably be an asset or a liability in terms of organizational survival, depending on factors existing in the larger population of organizations. Consider the Milwaukee school voucher example used by Ford and Andersson (2016), who found that well-established private schools had higher survival rates than new entries into the voucher school marketplace. In that case inertia was an asset, and older schools were household names with a parent-accepted and established approach to educating students. However, if Milwaukee parents suddenly expressed an interest for more online offerings and project-based learning, the inertia of long-established schools could prevent adaptation to consumer demand, and hence, inertia would become a liability.

The sixth theory is liability of newness theory, which states that new organizations into a sector must overcome the challenges of being a new provider before gaining a permanent foothold into the sector. Hager et al. (2004) utilized liability of newness theory to explain how the age of Minnesota nonprofit organizations impacts the likelihood of their survival. Importantly, age serves as a marker for all of the issues that arise from newness, including misalignment of services provided and customer needs, legitimacy, and level of development of organizational systems and staff. All of these issues are relevant from an organizational perspective because they occur relative to other members of the population. For example, for a new social service agency attempting to gain government funding, the challenge of developing effective systems that aid in obtaining a government grant makes the process more difficult relative to other well-established organizations.

The seventh theory is density theory, which uses the density of organizations within a population to explain the behaviors and trajectory of those organizations. For example, Andersson and Ford (2015) applied density theory to explain when new voucher schools open in Milwaukee. They found that new schools were less likely to enter the marketplace during times the market was saturated by existing education providers. Simply, when there is already a critical mass of providers in place, it becomes more difficult for a new provider to enter the marketplace.

While other theories (or alternative names for existing theories) do exist under the population ecology umbrella, they all have the common thread, like the seven presented theories, of explaining organizational behavior and/or trajectory in the context of the communities or marketplaces in which they operate (Astley 1985).

## How Can Population Ecology Be Applied?

Despite its roots in the study of for-profit firms, population ecology has wide-ranging applications for the field of public and nonprofit administration. A basic application is modeling the entry of an organization into an existing population. A core tenet of network governance is the supposition that private and nonprofit sector organizations can aid in public service delivery in ways that create efficiencies and help to solve wicked public problems (Savas 2000). But understanding the applicability of network governance arrangements requires knowing the conditions in which nonprofit and private organizations emerge. The entry of entrepreneurial actors is likely dependent on resource availability, larger regulatory

environment, perceived opportunity, and other factors exogenous to the organization itself. The application of population ecology to market entry gives policymakers a roadmap for creating conditions that encourage public entrepreneurship. Similarly, theories of population ecology can be used to model organizational exits. If nonprofit and private sector organizations are to be effective network governance actors, policymakers will naturally want to ensure they remain viable organizations over time. Many of the same factors leading to organizational entry, like regulation and resource availability, can also be applied models predicting organizational failure (see Anderson and Ford 2015; Ford and Andersson 2016).

Population ecology can also be used to study the factors that lead to innovation, be it in the public or nonprofit sector. A classical organizational theory approach to understanding innovation would look internally at organizational structure and incentives that encourage or discourage innovation. Population ecology allows external factors, such as competition between firms, regulation, and external incentives such as foundation funding, to be considered. From a policymaker perspective, such research can give guidance on how to spur innovation through policy. An example is the federal race-to-the-top funding competition that created financial incentives to create competition between state departments of education for purposes of spurring innovation.

The population ecology approach also encourages the differentiation of organizations by function in studies of organizational behavior and lifecycles. The species approach, discussed in detail by Amburgey and Rao (1996), recognizes that different types of organizations have different environmental factors that impact their behaviors and lifecycles. For example, the factors leading to the exit and entry of schools in Milwaukee's school voucher program (Ford and Andersson 2016) should logically be different than the factors determining entry and exit for human service organization populations (Twombly 2003) or mutual aid organization populations (Archibald 2007). Being able to account for environmental differences allows for a more precise assessment of the factors leading to nonprofit behaviors. While a population ecology approach may limit generalizability, it does so because it is often more precise.

Population ecology can also be used to measure the stability of functional sectors. In an era where all levels of government engage in contracting and are hence dependent on nonprofit and private sector organizations in key service delivery areas, it is important to know when sectors are stable and/or likely to change. Economic cycles, health-care costs, disruptive technology, climate change, etc. all have the capacity to affect a population's equilibrium and hence impact the function (or even existence) of organizations with the population. The stability of an organizational population can impact the extent to which governments contract out for services, budgeting decisions, and staffing decisions.

Finally, population ecology can be applied to the historical development of organizations. The necessity of longitudinal data means that population ecology studies often look into the past to trace the historical development of organizations (Ruef 2002). Looking at the past can provide insight into how positive developments can be replicated in new contexts and how negative impacts can be thwarted in new contexts. In other words, population ecology is a tool that policymakers and public and nonprofit administration scholars can use to learn from the past.

## Conclusion

Population ecology is a relatively young idea in the field of public and nonprofit administration. Notably, the foundations of population ecology are consistent with the ideals of early public administration scholars who argued that the field cannot be understood outside of its context. Organizations, be they public, nonprofit, or private, all operate within populations of other similar organizations. Logically, organizational decision-making is guided, in part, by the characteristics

of the population. Importantly, population ecology exists to supplement traditional organizational theories, not to supplant them.

# Population Policy, China

Paul C. Trogen[1] and Yuan Xu[2]
[1]East Tennessee State University, Johnson City, TN, USA
[2]Vanderbilt University, Nashville, TN, USA

## Synonyms

China; One-child policy; Population; Population policy; Two-child policy

## Definition

*Population policy* consists of government actions which influence or attempt to influence the growth, size, distribution, and/or composition of a nation's population.

## Introduction

China's population policy evolves to respond to changing social conditions. Even the one-child policy, the most controversial population policy in history (Whyte et al. 2015), was never an ideological blueprint for the future but only a temporary fix. During each policy, policy makers were already contemplating their next step.

## Types of Population Policy

Population policies can be divided into *pro-natal* policies and *population control* policies. Pro-natal policies encourage more children, whereas population control policies seek to limit births. Population control policies can again be divided into two categories, the *family planning gap* approach and the *desired children* approach.

The family planning gap approach assumes contraceptives are the best policy, as high fertility results from the inaccessibility and cost of

contraceptives (Pritchett 1994: 1–2). If contraceptives are distributed, people voluntarily use them to reduce births (Daugherty and Kammeyer 1995: 225). It assumes that individual freedom to pursue enlightened self-interest will coincide with the public interest (Gupte 1984: 183).

The second strategy, the "***desired children***" approach, suggests that development is the best contraception. People tend to have the number of children they want, subject to social, educational, cultural, and economic conditions (Pritchett 1994: 2). One empirical study found that 90% of differences in fertility between countries were accounted for by differences in desired fertility (ibid).

### Population Dynamics of Developing Nations

The People's Republic of China faced demographic challenges common to the developing world. Since 1950, the population of the developing world more than doubled (Pritchett 1994: 1). Almost half of the population in developing countries is young (Gillespie 1984), creating explosive demographic potential as these children approach their own childbearing years. If all couples were limited to only two children, the population would still grow 80%; most countries would need to limit births to one child per couple over the next 30 years just to stabilize the population (Gillespie 1984).

In China, irresistible demographic dynamics collide with immovable geographic constraints. While China has 22% of the world's population, it only has 7% of the earth's arable land (Gu 1997: 42). Only about 15% of China's land is suitable for farming. Until 1949, war, famine, and disease kept death rates near the birth rate, and the population was stable at 500 million (Gupte 1984: 178). When Mao reduced war and disease as population suppressants, China's population grew 20 million/year.

## Population Policy in China

In 1949, China was the world's most populous country, with a population of 500 million people. China remains the world's most populous country with approximately 1.3 billion.

### Initial Policy: Socialist Development Is the Best Policy (1949–1954)

Social transformation superseded population control as Mao's primary goal in 1949. Mao's statements on population showed appreciation of multiple approaches to population control. Mao took two steps which reduced fertility. The marriage law of 1950 raised the marriage age for women to 18 and Mao integrated women into the workforce (Kammeyer and Ginn 1986: 246). Officially, the purpose was to protect women. New health policies also improved basic health, controlled disease, and reduced death rates far more than the marriage law reduces birth rates. The population grew 20 million a year for the next ten years (Gupte 1984: 178).

Mao's public pronouncements extolled the value of China's vast population, "The more people we have, the greater our force". Mao said, "Every stomach comes with two hands attached," and the government encouraged births as a means to increase labor as the best way to increase production (Morrish 1994: 44). The People's Daily denounced birth control as, "A way of slaughtering the Chinese people without drawing blood" and called people, "The most precious of all categories of capital" (Gupte 1984: 178). Impressive agricultural results before 1957 seemed to vindicate Mao's confidence (Aston et al. 1984: 625).

### First Five-Year Plan

China's first population control campaign was part of the first five-year plan in 1954. The 1953 census revealed the population had grown to 600 million people (Gupte 1984: 179). By 1956 an intensive family planning program included distribution of contraceptives, educational programs on reproductive physiology, and a propaganda program extolling the virtues of small families (Kammeyer and Ginn 1986, p.247). Population policy was still pragmatically subordinated to socialist development. The first population campaign was implemented in cities, where only 20% of the people lived, because the collectivization of agriculture had higher priority in the countryside (Gupte 1984: 197). The shift from pro-natal propaganda to the family

planning gap message that contraception is the best policy was effective. The birth-rate fell substantially (Kammeyer and Ginn 1986: 247). The new propaganda encouraging small families foreshadowed future policies when state goals would supplant a family's own goals in family planning.

Mao's thinking raced ahead of official policy. He was conversant in many schools of population policy. Mao argued that development is the best contraceptive: "after 100 years . . . our cultural level will be high. When all the people are college educated, they will naturally practice birth control" (Zedong 1958). But Mao's top priority was building socialism. Mao was confident the Great Leap Forward would solve China's food problem: "We are not afraid of a population of 800 million or one billion" (ibid). Unfortunately, Mao's optimism collided with reality during the Great Leap Forward.

### The Great Leap Forward

The largest famine in world history occurred in China during the Great Leap Forward (1958–1961), when 30 million people died of famine during government efforts to collectivize agriculture and to shift resources from agriculture to industry (Aston et al. 1984: 614, 625).

The Great Leap Forward attempted to realize Mao's vision of economic growth through labor and socialist enthusiasm. "Human investment" led to building dams with shovels (Gupte 1984: 343).

During the Great Leap, opponents of population control won a temporary victory, and the first population campaign was abandoned (Kammeyer and Ginn 1986: 247). Proponents were denounced as rightists, purged from the Party, dismissed from ministerial posts, and repudiated their policies (Gupte 1984: 179; Kammeyer and Ginn 1986: 253). A rapid increase in the birth-rate resumed when the famine ended (Kammeyer and Ginn 1986: 247).

### China's Second Population Campaign

Following the Great Leap's failure, Mao was replaced by Liu Shaoqi as Chairman of the People's Republic of China, but Mao still retained leadership of the Communist Party (Aston et al. 1984: 614). China's second population campaign began in 1962 with a reinstatement of the previous population policies and programs (Kammeyer and Ginn 1986: 247). A central birth planning office was established, and contraceptives finally became widely available again in 1962 (ibid).

### Cultural Revolution Population Policy Reversal

In 1966, Mao initiated the Cultural Revolution to oust Liu Shaoqi as head of state and consolidate his control over the government. Like most government activities, the second population campaign and distribution of contraceptive supplies was interrupted (Kammeyer and Ginn 1986: 247). Red Guards sought to weed out anti-revolutionary elements in society (Kammeyer and Ginn 1986: 253) and persecuted family planning cadres (Ma 1996: 265). Suspension of population campaigns during both the Great Leap Forward and the Cultural Revolution led to a decade without a population program and led to a baby boom in the 1960s.

Liu Shaoqi was finally ousted as head of state in 1970. At that time, the average Chinese woman bore six children (Gu 1997: 41). Inside the government, family planning became a controversial topic. Opinions split into two factions: birth control (contraception is the best population policy) and family planning, which reflected Mao's idea of central planning for human reproduction. After 1969, an administrative framework for family planning was built (Population Policy 2014).

### Later-Longer-Fewer, China's Third Population Campaign, 1971

Political instability precluded an organized birth limitation program before 1971 (Kaufmann, et al. 1989: 708). Pragmatic politicians have little incentive to promote unpopular programs during a power struggle. After Mao reestablished firm control, the "later-longer-fewer" campaign reflected the recentralization of authority. "Family planning" became central planning. Births under later-longer-fewer were rationed under a quota system (Population Policy 2014). National birth quotas were passed down through the

administrative hierarchy (ibid). Couples wanting a child had to request a planned birth card from their local family planning committees in order to obtain obstetric care, while alternatives, such as abortions, sterilizations, and IUDs, were provided freely (Kammeyer and Ginn 1986: 249).

The **later-longer-fewer** campaign stressed three reproductive norms: *wan* ("later" as in later marriage), *xi* ("longer" as in longer spacing between children), and *shao* ("fewer" as in fewer total children) (Kammeyer and Ginn 1986: 247;). Committees for planned birth were organized at every administrative level. The delivery of contraceptives was closely tied in with the provision of basic health care by local clinics in urban areas and by the barefoot doctors in the countryside. Medical means of birth control were supplemented with peer group pressure in factories, enterprises, urban streets, and rural villages. Each small group received its allocated number of births. As a result, decisions regarding family size became subjected to intervention by the state in the form of peer group pressure (Population Policy 2014).

Implementation varied. While the national quota was set at the center, the local allocation of these quotas was determined at the local level. In 1980 the legal marriage age was raised two years (Kammeyer and Ginn 1986: 247). In the city efforts were made to delay marriage further until age 25 for brides and 27 for grooms. (Whyte et al. 2015). Local birth planning officials pressured couples to wait 3–4 years between births (Kammeyer and Ginn 1986: 248; Whyte et al. 2015) and to limit themselves to two children in the cities and three children in the country. Penalties were imposed for those who did not comply (Kaufmann et al. 1989: 708; Whyte et al. 2015). The later-longer-fewer campaign reduced births from six per woman to an average of three (Fong 2016: xiii).

## One-Child Policy

Mao died in 1976. A second generation of eight elders shared leadership, mentored by Deng Xiaoping, who had directed the economic recovery after the Great Leap Forward. Deng set a goal of quadrupling the per capita gross domestic product (GDP), a task made easier by slowing population growth (Fong 2016: 48).

The baby boom preceding the later-longer-fewer campaign created a large cadre of women approaching their childbearing years. In the 1970s, half of China's population was under 21 (Daugherty and Kammeyer 1995: 239). The problem was not people having more babies but more people having babies (Gupte 1984: 182). The huge bulge in the population pyramid in the 1960s had the potential to create an equally large echo effect in the 1980s (Gu 1997: 42). With a half billion young people approaching their childbearing years, even if each couple were to have only two children, a population explosion was imminent (ibid). China was already importing between 15 and 20 million tons of grain to feed its people (Gupte 1984: 162). In 1980, China's population appeared destined to reach 1.4 billion by 2000, surpassing the country's ability to feed itself (Morrish 1994: 45).

In the early 1970s, a project group using computerized population models projected that China needed to limit each couple to a single child (Ma 1996: 265). China's one-child policy was crafted by military rocket scientist Song Jian (Fong 2016: 48). Song projected that under a two child per family quota, the population would continue to balloon, and even with a one-child policy, the population would still grow for another 25 years (Fong 2016: 53). The policy would be necessary for three decades (Fong 2016, 58).

On September 25 1980, an open letter asked communist party members to voluntarily limit their family to one child (Fong 2016: x). The one-child policy progressed through three phases: (1) a restrictive policy with strong implementation, (2) a liberalized policy with relaxed implementation, and finally (3) a liberalized policy, with stronger implementation.

### First Phase: One-Child Policy Introduction

The first phase was a restrictive policy with increasing implementation. This policy was announced in 1979 and leniently enforced during 1980–1981 (Greenhalgh 1986: 491). Fines would be levied on families who violated the policy, based on family income and other factors. Fines

could range from inconsequential to five times annual disposable income (Fong 2016: 6, 67). From the central government to the local level, Population and Family Planning Commissions were created to raise awareness among the populace and to provide surveillance for implementation of the policy.

In 1983, circulars appeared calling for mandatory IUD insertion for women with one child, abortions for unauthorized pregnancies, and sterilization for couples with two or more children (Greenhalgh 1986: 491). Strict application of the one-child policy followed. National annual birth quotas were allocated to the provinces which assigned responsibility to local governments to set the number of births permitted in each area (Li 1995: 563). Local officials, either heads of work units or village heads, selected the families authorized to have a child (Li 1995: 563). Birth permits were not automatically granted to new couples; to achieve targets, local authorities required people to wait until they got a permit (Li 1995: 568). Pregnancies outside the plan (without permits) had to be terminated (Li 1995: 563). The birth-rate dropped to 1.385 per couple in 1984 (Ma 1996: 267), but there were unanticipated consequences. Abortion and sterilization campaigns led some couples, desperate for a son, to commit female infanticide (Greenhalgh 1986: 491). Unanticipated levels of resistance erupted; women illegally removed their IUDs or ran away to cities or the wilderness to have children, and people attacked family planning workers (Greenhalgh 1986: 508).

### Second Phase: Central Document 7

In 1984, the nationwide one-size-fits-all measure proved so unpopular that the central government was forced to decentralize a large portion of the one-child policy (Fong 2016: 71). Document 7 encouraged the development of local policies at the local level to suit local needs (Greenhalgh 1986: 493; Short and Zhai 1998: 374). Revisions enabled those most in need to have a second child (Greenhalgh 1986: 507). This liberalization was likely due to a desire to stop female infanticide (Mosher 2001: 45) and to ease political strains at the local level (Greenhalgh 1986: 492).

Each of the 30 provinces developed its own family planning laws, to meet 5-year targets set by the Central Family Planning Commission. The provincial-level administrative regions were divided by household registration status. Families with urban household registration status could have only one child. Policy divided citizens with rural or agricultural household registration status into three categories. Residents in Beijing, Tianjin, Shanghai, Jiangsu, Chongqing, and Sichuan provinces still needed to follow the one-child rule. In Hainan, Qinghai, Ningxia, Yunnan, and Xinjiang provinces, residents with rural household registration status were allowed to have two children. Families in the other 19 provinces would follow the rule of 1.5-child policy which means if the first child was a girl, a second child was allowed as long as their births were within the plan and did not jeopardize the goal of limiting population to 1.2 million by the year 2000 (Greenhalgh 1986: 492). The birthrate, which was 13.85 per thousand in under the strict policy 1984, rose to 20.0 per thousand under the relaxed policy during 1986–1989 (Ma 1996: 267).

With increasing flexibility came increasing responsibility. The second reform in the second phase of the one-child policy strengthened the cadre responsibility system (Greenhalgh 1986: 493) and held local cadres accountable for successful implementation (Short and Zhai 1998). Cadre responsibility systems spelled out the rewards for success and penalties for failure (Greenhalgh 1986, p.503). Provincial officials also became responsible for family planning outcomes:

> In 1990 the central government instituted a nationwide accountability system. Called *yipiaofoujue* (loosely translated as "one-vote-veto"), it made birth-planning targets a major objective for all provincial authorities. Administrators who did not meet their area's birth quotas could face wage reductions, demotions, or even dismissal. (Fong 2016: 73)

A third reform during the second phase was the Information Management System (Greenhalgh 1986: 504). Continuous systematic monitoring of fertility assured that targets were met (Greenhalgh 1986: 499). The system recorded the status of women of reproductive age

(Greenhalgh 1986: 504). One reporter's visit to a family planning service station in Jiekuang Village Elementary School in Hunan Province showed how the system worked (Lawrence 1994). A chart on the wall recorded the 160 women of childbearing age assigned to that station. Of 160, 125 were sterilized, twenty were using IUDs, five were infertile, and four were on the pill. One had a recent birth, and five had permits to have babies (ibid). Every six months, family planning workers performed ultrasounds on women using birth control to ascertain if the steel ring IUD was in proper position and to catch babies conceived outside the plan early enough to perform safe abortions (ibid). Any such woman lacking an allotted a space in the official quota was expected to have an abortion (ibid).

### Third Phase: Liberal Policy with Strong Implementation

The third phase of the one-child policy was a liberalized policy with stronger implementation. A December 19, 2000, State Family Planning Commission white paper set a population cap of 1.6 million by 2050 and reiterated that targets and quotas were to be achieved by education and persuasion (Mosher 2001: 45). The Chinese Communist Party Central Committee elevated population goals to the level of economic goals. Village cadres would also have their salaries docked for poor performance.

### Selective Two-Child Policy

After the eighth session of the third plenary in November 2013, the Chinese Communist Party Central Committee revised regulations, among the most important of which was the selective two-child policy. The selective two-child policy was a prototype that allowed families formed by the marriage of two single children to have two offspring.

The selective two-child policy signaled the imminent phasing out of the one-child policy. Its purpose was attained. The one-child policy was an interim solution to drastically reduce the fertility of one generation (Greenhalgh 1986: 508). The youngest children of the baby boom were now over 40 and had declining fertility. Relaxing the one-child policy became feasible once the baby boom generation passed beyond their childbearing years.

### The Two-Child Policy

Officials implemented a two-child policy in late 2015 because of early indications that the one-child-policy was creating a labor shortage. In 2015, the last year of the 12th five-year plan, the demographic dividend generated by workers born in the 1960s, baby boom was evaporating, and economic growth slowed. According to Peian Wang, the vice director of China's National Health and Family Planning Commission, the two-child policy is more practical than the selective two-child policy because it better serves China's current population and economic trends. Now anyone will be allowed to have a second child, regardless of where they live.

China's move to a two-child policy may be too little too late. When Beijing adopted the selective two-child policy in 2013, only about one tenth of the eligible couples applied to have a second child (Fong 2016: xii). Many say it is too costly and stressful to raise a second child (Fong 2016: xii;). The costs of services like schooling and health care are still prohibitively high (Fong 2016: 7). A survey conducted by Shanghai Academy of Social Sciences shows that the average spending per child per year in 2011 was 32,000 yuan (about $5000 US dollars), compared to the average disposable family income 31,838 yuan (Wu and Yu 2011). Since the cost of an additional child exceeds average the disposable family income, 45.3% of parents in this major city did not want to have a second child, even if allowed. Modern educated women choose to have fewer children (Fong 2016: 55).

Thirty five years of the one-child policy allowed many Chinese to internalize the one-child household as the ideal. If Beijing is unable to reverse this thinking, China's population will peak between 2020 and 2030 and then decline to 1950 levels in 2100 (Fong 2016: xii).

## Conclusion

### Policy Evolution

In less than 70 years, China has run the full circle of population policy. First, the official policy was "each stomach came with two hands attached" as population was extolled as labor as China

endeavored to build socialism by hand. The first population control policy worked under the assumption that contraception is the best policy. The next policy was family planning but with Chinese characteristics that planning was designed to meet central birth quotas. The next step was the one-child policy. This policy worked too well. After 35 years, the one-child policy has changed Chinese culture, and many urban couples now prefer to have only one child. Now, a shrinking labor force insufficient to support China's retiring baby boomers is causing China to successively relax its population policies in hope of more births. But, as other developed countries have discovered, encouraging people to have more children often has modest impact. The People's Republic of China's population policy has now come full circle. China's challenge will be to encourage its modern, educated, urban workforce to have enough children to support its retiring baby boomers. This will be the hardest challenge yet.

## Synonyms

Women's career advancement; Women's job promotion

## Definition

Women's job promotion is when a woman is moved up in the hierarchical levels within an organization. The more responsibilities and

P

higher levels of authority within the organization will be the result of this promotion for women.

## Introduction

One of the concepts that is very important for economic growth and sustainable development is gender equality. Gender equality means that all members of society, regardless of gender, have equal opportunities in terms of access to livelihood resources, health, and education and people can participate in social, economic, and political affairs without any gender discrimination (Madan and Gill 2011). According to the Office of the Special Adviser on Gender Issues and the Advancement of Women United Nations (OSAGI) in 2001, the importance and necessity of promoting gender equality stems from two rationales. The first reason backing up gender equality promotion is considering human rights and social justice issues as providing women with equal opportunities, rights, and responsibilities as men are directly related to these issues. The second rationale is sustainable people-centered development. In other words, increasing gender equality could be a precedent of sustainable people-centered development in which considering both genders as beneficiaries of development with equal share is an essential requirement (Warth and Koparanova 2012). Gender equality is an essential goal in both the ILO's Decent Work Agenda and the 2030 Agenda for Sustainable Development. The importance of this issue is to the extent that 5th Goal of the SDGs is specifically dedicated to achieving gender equality and empowering women and girls, while these issues are somehow obvious in other 16 goals (LOSTAT 2019). One of the conditions for achieving sustainable development is the real and active participation of women in the development process and the reduction of gender inequalities. According to the International Labor Organization, in the last 29 years, the participation of women older than 15 has decreased from 51% to 47% (Fig. 1).

On the other hand, as higher levels of education are being widespread among- women, their participation and their will to be promoted to public managerial positions tend to be a more critical issue, regarding sustainable development; however, there are still severe barriers and obstacles in the way of women's advancement in their

**The Position of Women in Iranian Public Sector Organizations: Facts and Challenges, Fig. 1** Labor force participation rate, female (percentage of female population ages 15+)

career to senior managerial levels. One of the current problems in organizations for women is the lack of fit between women's education/experiences and the managerial positions to which they get assigned. Based on the World Labor Organization's Sustainable Development Index, in spite of the fact that the share of women in management positions has increased to 27.8%, the increase has been only 4% for more than two decades (Fig. 2). Thus, although women still are taken into account around half of the workforce, they hold a small share of managerial positions. Studies in various countries including Indonesia (Herri and Handika 2016), Iceland (Einarsdottir et al. 2018), and the United Kingdom (Howe-Walsh and Turnbull 2016) show that the lack of proper activity of women in executive positions in the senior decision-making levels of large organizations is a global phenomenon.

Also, studies show that in different countries, the share of women in managerial positions is low. For example, according to the Human Development Report, women's share of management positions (in 2018) for high-income countries, low-income countries, Europe, and Central Asia is, respectively, 34.8%, 22.2%, and 34.5%. In Iran, as in many countries, the rate of women's participation in managerial jobs is not proper. In other words, regarding women's capabilities, there is still a significant gap between men and women in occupying managerial vacancies. For instance, out of 69,133 managers in Iran public sector, 12,850 are women, and 56,283 are men. In other words, only 18.6% of public sector managers are women (The vice Presidency for Women, and Family Affairs, Islamic Republic of Iran 2019). These statistics mean that women will be promoted to only certain levels in the organizational hierarchy, where some obstacles prevent them from being promoted further. These obstacles are referred to, as "Glass ceiling." Glass ceiling is a term to describe artificial and invisible barriers to organizational and ideological bias and discrimination; Barriers that in practice prevented women and racial minorities from achieving high positions and job positions.

In recent years, benefiting from the empowerment of women in senior management has been a priority of the Iranian government (for example, allocating a 30% share of women in managerial positions), but there are challenges and problems in achieving this goal. Hence, the purpose of this entry is to examine the barriers to promoting

**The Position of Women in Iranian Public Sector Organizations: Facts and Challenges, Fig. 2** Female share of employment in managerial positions in the world (%), 1991–2019

P

women to managerial positions in Iranian government organizations. Since, the phenomenon of "glass ceiling" plays a vital role in the failure of women to climb up the organizational ladder and is an allusion to the failure of women's efforts to attain senior, executive, and top management positions, accordingly, we first discuss the phenomenon of the glass ceiling. We then review the adjustments made to reduce gender inequality (closely related to the concept of a glass ceiling). We have done this by examining policy-legal considerations and indicators in international instruments. Legal considerations regarding the management of women in Iran and Iran's situation in terms of the international indicators and approach are other sections of this entry. Finally, we will address Barriers to promoting women to managerial positions in Iranian government organizations.

## Glass Ceiling

The term glass ceiling was first used in 1986 by the Wall Street Journal (Weyer 2007). This irony referred to gender discrimination, which describes a barrier that prevented women from growing above a certain level in an organization (Simon 1996). The term was used in 1990 to refer to a small number of women and minorities to administer public and private sector organizations. In women's employment in managerial positions, the glass ceiling shows an issue in which women are less likely to be appointed to managerial and senior positions. Burn (2005) defined the glass ceiling as the prevalence of occupational discrimination that gradually leads to a real but invisible obstacle to promoting women to high positions of power (Burn 2005). Researchers have emphasized that the glass ceiling is a barrier, which prevents women to be chosen for high-level positions not due to any disability, but just because they are women. The glass ceiling is the result of common myths and perceptions. The International Labor Organization studied female share in management employment and the working-age population from 2000 to 2019 (ILO's Website), and regarding this study, while women make up about 50% of the working-age population, only about 40% of them are employed. The other 60% do not contribute to economic activities, not because they are disable, but because there are barriers, which make paid job inaccessible for women, and among the whole occupational barriers for women, the only factor that has been recognized as a barrier for women to work in managerial positions since 2000 is known as the glass ceiling. So it is not surprising to face the fact that just 27% of employed women (the 40% active women out of all women who are in working-age) occupied managerial positions (ILOSTAT 2019).

Since the glass ceiling is a consequence of gender discrimination, one of the necessary measures to break the glass ceiling is to moderate gender inequalities. Studying international documents reveals two types of efforts which are aimed to demolish gender inequality: policy-legal considerations and indicators of human and gender development in international instruments.

## Adjusting for Gender Inequality

The international community emphasizes the concept of "gender equality." International instruments and the practice of human rights institutions emphasize the fight against gender inequality to achieve gender equality between women and men in all individual, family, and social matters.

> Gender equality refers to the equal rights, responsibilities, and opportunities of women and men and girls and boys. Equality does not mean that women and men will become the same but that women's and men's rights, responsibilities, and opportunities will not depend on whether they are born male or female. Gender equality implies that the interests, needs, and priorities of both women and men are considered, recognizing the diversity of different groups of women and men. Gender equality is not a women's issue but should concern and fully engage men and women. Equality between women and men is considered both as a human rights issue and as a precondition for, and indicator of, sustainable people-centered development. (European Institute for Gender Equality 2017)

Gender inequality refers to the injustice done to the rights of half of the members of human society because of their gender and femininity. One of these inequalities is seen in the low rate of

promoting women to managerial levels. In order to create equality in the workplace, many efforts have been made in the form of regulation. However, discrimination could be still observed in certain social groups; women face more injustice than men in most economic equity indicators, such as income, unemployment, and occupational distribution (Trentham and Larwood 1998).

Until the 1970s, not only were women not considered as important actors in economic activities, but also were referred to as second gender. They were dominated by men, and women's participation and exploitation in projects were often overlooked. This inequality is rooted in the traditional division of labor between men and women, which in practice has led women to focus on domestic work and to push men to work outside the home. Since the 1970s, there have been changes in attitudes toward the role of women in economic activities. The proclamation of 1975 as the "International Women's Year" (IWY) by the United Nations is an example of this process of change. March 8 is being celebrated as International Women's Day since 1975. The International Women's Year (IWY) drew the world's attention to the undeniable role of women in development and created the necessary incentives in international organizations and many governments to try to eliminate discrimination against women. One of the proposed alternatives to eliminate this problem is positive discrimination. Cambridge Dictionary defines positive discrimination as "the act of giving an advantage to those groups in society that are often mistreated because of their race, sex, etc." The definition is similar to Merriam-Webster's definition, which is "the practice of improving the educational and job opportunities of members of groups that have not been treated fairly in the past because of their race, sex, etc."

Due to the importance of this issue, two types of actions, namely, legal considerations and international index are explained in following pages.

## Policy – Legal Considerations

Gender equality is one of the objectives of the United Nations Universal Declaration of Human Rights. The United Nations adopted the Convention on the Elimination of all Forms of Discrimination against Women (CEDAW) in 1979. CEDAW is an international bill of rights for women, which was instituted in 1981 and ratified by 189 states. This convention is the most important United Nations Convention on the Elimination of All Forms of Discrimination against Women and defines gender discrimination as follows:

> Any distinction, exclusion or restriction made based on sex which has the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise by women, irrespective of their marital status, on the basis of equality of men and women, of human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field.

Article 3 of this convention focuses on "basic human rights and fundamental freedoms" through the "political, social, economic and cultural fields" and suggests that the countries guarantee these items for women "on the basis of equality with men." Also, The United Nations Development Program (UNDP) has introduced a five-point strategy to accelerate progress toward gender equality. According to the third target, at least 30% of national decision-making positions should be allocated to women (United Nations Development Program 1995: 9). Recommended initially in 1990, this includes being in parliament, and if possible, in the cabinet, and working with government and economic institutions at the management level. Due to the limited information available to the United Nations, access to political power is measured only by the number of women in government positions at the national level. Furthermore, the United Nations Millennium Declaration, which was signed in 2000, includes eight goals. The UN Member States had agreed upon these goals, and set 2015 as a deadline to achieve them. The third goal focuses on promoting gender equality and empowering women. Gender equality and women's empowerment are part of the Sustainable Development Goals (SDGs) that succeeded the MDGs in 2016. SDGs call for action to ensure economic growth not only socially and economically but also environmentally. The fifth goal of the seventeen goals of this

document refers to "ensuring gender equality and empowering all women and girls" (UN 2015). One of the targets of this goal is to "Ensure women's full and effective participation and equal opportunities for leadership at all levels of decision making in political, economic and public life" (UN 2015).

To preserve the SDGs, ILO helps developing countries in different fields, including promoting income, decreasing the unemployment rate, and providing both men and women with good job opportunities (Kring 2017). The main goal of the International Labor Organization is to work with member countries to achieve full employment, production right job, and for all, including women and youth. This goal was outlined in the ILO Declaration on Social Justice in 2008 for globalization of justice and is now widely accepted by the international community. Regarding the work environments, the ILO's considerable proportion of efforts focused on eliminating any kind of discrimination in employment and occupation. ILO's first concern is defining criteria and coordinating endeavors against at-work-place discriminations. The main Conventions adopted by ILO to encourage adhering countries to unite against employment and occupation-related discriminations are Discrimination (Employment and Occupation) Convention, 1958 (No. 111) and Equal Remuneration Convention, 1951 (No. 100), and the Recommendations associated with them.

Equal Remuneration Convention, 1951 (No. 100): Refers to equal compensation for work of equal value done by either men or women in member countries. This principle applies through national law, any wage-setting system established or recognized by law, collective agreements between employers and workers, or a combination of different methods.

Discrimination (Employment and. Occupation) Convention, 1958 (No. 111): This Convention was adopted to accept the principle of nondiscrimination in areas such as gender, access to vocational training, access to employment, and equal conditions for employment. Each Member for which this Convention is in force undertakes to declare and pursue a national policy designed to promote, by methods appropriate to national conditions and practice, equality of opportunity and treatment in respect of employment and occupation, with a view to eliminate any discrimination in respect thereof.

International Employment Policy Convention, 1964 (No. 122): refers to the freedom to choose a job so that every worker, regardless of race, color, religion, gender, political opinion, national affiliation, and social origin, has all the opportunities to education and has the necessary expertise to access a suitable job and use your expertise and capabilities.

In addition to these international standards, in response to concerns about gender discrimination, countries worldwide have made various efforts, especially on gender equality in the workplace. The Gender Discrimination Act of 1975 and The Equal Rights Act of 1970 in the United Kingdom; the Equal Pay Act of 1963, The Civil Rights Act of 1964, and the affirmative action policy of 1965 in the United States; the 1976 Act on Equal Pay for Men and Women in Denmark; and The 1978 Act on Gender Equality in Norway are the results of such endeavors.

## Indicators of Human and Gender Development in International Instruments

To measure gender equality and women's empowerment at the international level, numerous indicators have been defined, among which gender development index (GDI), gender empowerment measure (GEM), gender Inequality Index (GII), and gender gap index (GGI) are the most well-known. Gender data is critical in monitoring the progress of gender equality and ensuring the successful implementation of all SDGs programs.

Human Development Index (HDI): The United Nations Development Program (UNDP) in 1990 used the Human Development Index (HDI) as a way to measure national development, using crucial dimensions of human development such as Health-Life expectancy at birth, education-expected years schooling for school-age children

and average years of schooling in the adult population, and income-measured by Gross National Income (GNI) per capita (PPP US$). Development programs also sought to select indicators to identify how to deal with different groups in the human development of each country and compare them with similar groups in other countries. The Human Development Report then introduced two new indicators which seem helpful to determine the status of women in each country. These two indicators are: Gender Development Index (GDI) and Gender Empowerment Index (GEM). Using these statistics, the situation of women in general and their status in managerial positions are analyzed and examined.

Gender Development Index (GDI): The GDI is the ratio of the HDIs calculated separately for females and males using the same methodology as in the HDI. In other words, the Gender Development Index is the human development index set to measure gender inequality (United Nations Development Program 1995: 73).

Women's Empowerment Measure (GEM): This index considers the growth of women in a country from a political, economic, and professional point of view. More clearly, the Gender Empowerment Index emphasizes that women can participate in political and economic decisions and that they can contribute to development of their countries. A country's position in the field of gender empowerment is determined using three indicators: (a) Proportion of seats held by women in national parliaments, (b) a percentage of women in economic decision-making positions (incl. Administrative, managerial, professional, and technical occupations), and (c) female share of income (earned incomes of males vs. females), which indicates the level of achievement They refer to jobs and wages. Together, these indicators provide information that determines women's ability to use a country's potential. To achieve balance, equality, and elimination of discrimination, and as a result, better and more complete development of society, women must be able to participate in the decision-making process at different levels of society. At the global level, international organizations have paid particular attention to women's participation in decisions and high-level careers, and one of the essential indicators that is considered as a measure of gender development and women's empowerment is the level of women's participation in the country's major decisions as well as their presence in managerial positions.

Gender Inequality Index (GII): The Gender Inequality Index reflects the gap between men and women achievements in three dimensions: reproductive health, measured by maternal mortality ratio and adolescent birth rates; empowerment, measured by the proportion of parliamentary seats occupied by females and proportion of adult females and males aged 25 years and older with at least some secondary education; and economic status, expressed as labor market participation and measured by labor force participation rate of female and male populations aged 15 years and older, and means the extent to which potential human development may be lost due to gender inequality in the dimensions measured. The range of this index can be changed between zero (equality of women and men) to one (excluding women in all measured dimensions), and thus, the higher the GII value, the more disparities between females and males and the more loss to human development.

Gender Gap Index (GGI): The World Economic Forum has been reporting on the Global Gender Gap Index since 2006. This index shows the gap between men and women in the four primary dimensions:

- Health and survival – outcomes on life expectancy and sex ratio
- Educational attainment – outcomes on access to primary and higher-level education
- Economic participation and opportunity – outcomes on salaries, participation levels, and access to high-skilled employment
- Political empowerment – outcomes on representation in decision-making structures

It is a framework for measuring gender inequality and its evolution over time.

Considering these practices and the international index, the authors tried to present the image of Iran. It should be mentioned that the present manuscript studies the public sector.

## The Image of Employment and Promotion of Women in Iran

The women who work in the public sector are one of the most significant capitals and, as one of the most critical elements of the administrative system; they play a critical and decisive role in society. The result of their efforts is ultimately the growth and development of society. Therefore, identifying barriers and challenges for the promotion of women in managerial positions in Iranian government organizations can help to eliminate and improve problems and barriers. In this study, first, the description of the glass ceiling as a global concept and metaphor of invisible barriers to the promotion of women was presented. Since the glass ceiling is the result of gender inequality, to examine global efforts to reduce gender inequality in the world, we addressed policy-legal considerations and indicators of human and gender development in international documents. Describing the status of employment and promotion of women in Iran in this section is based on upstream laws and documents as well as international indicators. And finally, the obstacles to the promotion of women to managerial positions in Iranian government organizations will be put into discussion.

## Legal Considerations Regarding the Management of Women in Iran

To achieve human development, it is necessary to pay attention to the role of women in the development process of the country and meet the demands of this large group in the development and macro-policies. Before examining the position of women in Iran's development plans, we will point out some essential public policies that support women and their rights (All the mentioned laws and approvals have been adapted from the website of the Islamic Parliament Research Center Of The Islamic Republic Of IRAN.):

The Constitution of the Islamic Republic of Iran: The Constitution of the Islamic Republic of Iran is based on religious and national principles and considers Iranian women's rights according to Islamic criteria. Some articles of the constitution describe the status of women. In the introduction of the constitution, there exists a specific topic "women in the constitution," which shows women's importance for legislators. Articles 3, 19, 20, 21, 28, and paragraph 4 of Article 43 of the Constitution also emphasize the equal rights of men and women and the free choice of job opportunities.

The Vision Document of the Islamic Republic of Iran: This document is a description of Iran's horizons in terms of development, social justice, legitimate freedoms, equal opportunities, and demolishing poverty and discrimination by 1404.

General policies of the administrative system: These policies, as a roadmap for reforming the administrative system, announced in 2010 by the Supreme Leader, focus on justice in recruitment, job security and promoting human resources, meritocracy based on Islamic ethics in the appointment and promotion of managers and emphasis has been placed on strengthening the family and creating work-life balance in the administrative system, and avoiding any narrow-minded, distasteful and unprofessional attitudes in attracting capable, committed, and worthy human resources.

Also, the Supreme Administrative Council in the 100th session dated 12/24/2002 in Article 7, Note 2 enacted that in order to promote women's participation in management, the public organization must plan and take the necessary actions to identify and enhance the capacity of Women and their appointments at managerial levels so that the appointment of women to managerial positions increases every year.

Also, Resolution 288 of the Supreme Council of the Cultural Revolution in 1992 entitled "Women's Employment Policies in the Islamic Republic of Iran" with the theme of establishing social justice, while emphasizing women's employment in cultural, social, economic and administrative jobs, has required government agencies to provide the necessary facilities for women's employment. Besides considering gender justice in women's employment, it has

considered encouraging educated and experienced women to hold management positions and staff jobs, in order to be able to use their efficiency at the highest executive levels.

Policies for International Women's Activities is another resolution of the Supreme Council of the Cultural Revolution adopted in 2003 (Resolution 516). One of its goals is to grow and promote the scientific and practical knowledge of women to have a more favorable interaction in the international arena. Efforts to create new and appropriate arenas to take the initiative of Iranian women in international decision-making and using women's capabilities at various levels of management of international affairs and foreign policy of the Islamic System are some of its policies.

Protection of Women's Rights and Responsibilities Law in Domestic and International Areas, was approved by the parliament in 2006. This law focuses on the rights of women to participate in policy-making, legislation, management, implementation, and supervision in the field of health, cultural affairs, especially for women, as well as educational, scientific activities in a domestic and international context.

Charter of Women's Rights and Responsibilities: The Charter of Women's Rights and Responsibilities in the Islamic Republic of Iran, approved in 2004, as a reference document of policy-making, supposes the basis to present and explain the position of Iran's women in international forums. This charter defines the rights and responsibilities in employment and economic participation of women, taking into account the right to employment, freedom to choose a job, the right to equal pay, and benefits in similar working conditions with men.

The President's Charter of Citizenship Rights 2016: Article 11 of the Charter stated that women have the right to participate actively and effectively in policy-making, legislation, administration, implementation, and oversight, and to utilize equal social opportunities by Islamic standards. Article 83 of the Charter also pointed out that women must have the right to good employment opportunities and equal pay and benefits to men for equal work.

## Five-Year Economic, Social, and Cultural Development Plans of the Islamic Republic of Iran

Although in the first 10 years of the revolution (1988–1978) development planning has not been considered seriously, widespread participation of women in the process of revolution and the 8-year war, undoubtedly, had an considerable effect on increasing women's desire to promote their positions. In the First Five-Year Economic, Social, and Cultural Development Plan of the Islamic Republic of Iran [1989–1993], due to the economic crisis after the war, all attention and efforts were focused on economic issues, and there was no attention to women's positions in organizations. This plan emphasizes more on women's participation in social, cultural, educational, and economic affairs and on maintaining family foundation and transcendental values of female Islamic personality, raising the level of literacy and general knowledge of society, significantly increasing the educational coverage of girls, promoting women's political place and social prestige by making pervasive education and increasing their participation opportunities. In terms of education, women were focused on general education and increasing their participation in the economic and social affairs. Also, developing women's sport has been a serious concern.

In the Second Five-Year Economic, Social, and Cultural Development Plan of the Islamic Republic of Iran [1995–1999], planning and allocating resources to sport-related facilities, developing programs for women's leisure time – more women's participation in social, cultural, educational, and economic activities – and concerns about population and family planning were the important topics of the plan. The Third Five-Year Economic, Social and, Cultural Development Plan of the Islamic Republic of Iran [1999–2003] have included a spatial approach based on increasing participation of women in social, economic, and cultural arenas, compared to the two previous plans. For example, according to Article 158 of this plan, seven elements have been focused on: the educational affairs, cultural

affairs, sports affairs, employment (economic participation), scientific and research affairs (studies and research on women's issues), legal affairs, and the development of NGOs. At the national level, the gender gap has narrowed significantly during the Third Plan. Iran's "Human Development Index" increased, and at the same time, the "Gender Human Development" and "Gender Empowerment" indices have significantly improved, indicating that they have raised Iran's ranking among other countries in these two respects. The Fourth Five-Year Economic, Social, and Cultural Development Plan of the Islamic Republic of Iran [2005–2009] is the first plan based on a long-term approach, (20-year vision document). Supporting women-headed households in the areas of housing, special support insurance, empowerment, increasing monthly pensions, emphasizing equal pay for men and women for equal work, equal opportunities for men and women, and empowering women by providing opportunities to achieve the appropriate jobs were among the essential items of this plan. Among the various groups of women (married, single, urban, rural, employee, student, etc.), the Law on the Fifth Five-Year Economic, Social and Cultural Development Plan of the Islamic Republic of Iran [2011–2015] pays special attention to housewives and the other groups of women typically have been ignored. Elimination of gender perspective, ignoring women's affairs, budget reduction of women's affairs, and considering women only as householders is one of the significant drawbacks of the Fifth Plan law (Ghadimi et al. 2011). One of the essential features of the Sixth Five-Year Economic, Cultural, and Social Development Plan of the Islamic Republic of Iran [2016–2020] is paying attention to the role of women, emphasizing gender justice in Article 101. Article 101 of the plan obliges all executive organizations to achieve the objectives outlined in Articles 10, 20, and 21 of the Constitution of the Islamic Republic of Iran, the objectives of the 20-year vision document, and the general policies of the Sixth Plan.

General family policies are based on "strengthening the institution of the family and the position of women in it and the fulfillment of women's religious and legal rights in all areas and paying special attention to their constructive role" in order for society to benefit from women's human capital in the process of balanced, sustainable development. According to Article 101 of the plan, in order to benefit the society of women's human capital in the process of balanced, sustainable development, all executive organizations should apply the approach of gender justice based on Islamic principles in its policies, programs, and plans and evaluate the effects and decisions based on the indicators provided by the National Headquarters for Women and Family of the Supreme Council of the Cultural Revolution. It should be done through organizing and strengthening the organizational position of women and family affairs in organizations. The aim of this Plan is the promotion of women's participation in the field of economics and politics by creating equal opportunities and overcoming gender injustice. In short, in the first and second development plans, attention to gender justice in the development process is weak. Although the third and fourth plans focus on gender justice, the law of the fourth plan is more successful in terms of the status of women. In particular, this trend has continued in the fifth and sixth Economic, Cultural, and Social Development Plans (Ghadimi et al. 2011).

## Iran' Situation in Terms of the International Indicators and Approach

According to the Statistical Center of Iran survey (2018), of the total population of active women in Iran's labor market, 948,884 are working in governmental organizations; however, the data of 2019 shows a reduction of about 3000 in this population. Even though the laws and policies facilitate holding most of the decision-making positions for women, in 2019, out of 69,133, only 12,850 were female. In other words, 18.6% of managerial jobs in the public sector are allocated to women. As we move toward higher management levels, this rate decreases (15.7% for operational level, 2.7% middle level, and 0.09% for the top level.

According to the report of women in the management positions of the government, female managers at all levels increased from 13.7% in 2017 to 18.6% in 2019, and in general, female managers' appointment in the last 2 years has seen a growth rate of 36%. Referring to the 36% growth rate of the appointment of female managers since 2017, the number of line managers in 2017, 2018, and 2019 were 7990, 9736, and 10,859, respectively. The number of female middle managers in 2017, 2018, and 2019 was 1423, 1670, and 1924, respectively, and the number of female senior managers in those years was 31, 48, and 67, respectively. The ratio of male managers to total public sector managers in 2019 was around 81.4%, which indicates the low level of participation and success of women in obtaining managerial positions and the lack of managerial opportunities for them in government organizations compared to men. Figure 3 compares the number of male and female managers in government management positions in Iran in 2019.

Also, the growth of educated girls and women has caused women overtake men in society, so the need to discuss women's management becomes essential more than ever.

Although Iran's approach is based on gender justice not gender equality considered by international gender indicators, examining the situation of Iran in international indicators can present a comprehensive image.

## Iran Human Development Index (HDI)

According to the Human Development Report (2019), Iran's human development index is 0.797, and its rank among countries is 65 from 189, which puts the country at the top of human development. Norway ranks first, and Nigeria ranks 189th.

Between 1990 and 2018, the HDI value of Iran (Islamic Republic) increased from 0.577 to 0.797 (38.3%), and as shown in Fig. 4, it has had an upward trend until 2018.

## Iran Gender Development Index (GDI)

Iran's gender development index for 2018, according to the 2019 Human Development Report, is 0.874, placing it in Group 5. The

P

**The Position of Women in Iranian Public Sector Organizations: Facts and Challenges, Fig. 4** Human development index (HDI), 1990–2018

value of Iran's gender development index for women is 0.727 whereas for men is 0.832 (UNDP 2019). The gender development index for women in developing countries is 65% of men, in underdeveloped countries 48% of men, and in Iran, this index is 72% of men (see Table 1).

## Iran Gender Inequality Index (GII)

According to the 2019 Human Development Report, the average global gender inequality index in 2018 is 0.439 among 162 countries. Iran ranks 118th with an index of 0.492, which means that a considerable loss of potential human development is anticipated because of gender inequality in the three areas: reproductive health, labor market, and empowerment. In the four divisions of human development levels, Iran is in the category of countries with high levels of human development, but the rate of gender inequality in Iran is higher compared to this group (0.331). As Fig. 5 shows, Iran has a higher rate of gender inequality than its northern neighbors (Armenia, Azerbaijan, and Turkey). However, it has better situation in comparison with some its neighbors and some Persian Gulf countries.

## Iran Gender Gap Index (GGI)

According to the 2020 report of the World Economic Forum, Iran is ranked 148th by eliminating 58% of the gender gap in the measured dimensions between 153 countries. Iran has decreased by six ranks since 2018, and Iran's gender gap index has increased by 0.020 since 2016, and by 0.005 since 2018, which indicates Iran's unfavorable situation in this index. In 2020, the global gender gap score (based on average population weight) was 69%. This gap means that, on average, the gap is narrowing, and the remaining gender gap is 31%. No country has as yet achieved full gender equality. All top five countries have closed at least 80% of their gender gap, and the best country (Iceland) has so far closed 82% of its gender gap.

As shown in Fig. 6, the global gender gap differs significantly in these four dimensions of health, education, economic participation, and participation in political power (political empowerment). In both education and health, 96% and 97% of the gap (respectively) have already been closed. Instead, in terms of political empowerment and economic participation, respectively, just 25% and 58% of the existing gaps have been

**The Position of Women in Iranian Public Sector Organizations: Facts and Challenges, Fig. 6** The state of the gender gaps (%)

closed, which do not have appropriate conditions comparing to education and health.

According to Iran's gender gap index in 2020, eliminating the gender gap in the issue of economic participation, participation in political power, health, and education is, respectively, 38.1%, 3.7%, 96.6%, and 95.3%. The above data and information indicate that Iran has a long way to bring the gender equality index to the desired level, and it can be considered a serious and fundamental social issue.

Also, a study of the trend of this index during the years 2006–2020 in Iran shows that Iranian women in terms of health and education indicators are in a much better position than most countries in the region, but in terms of economic participation and participation in political power are ranked low.

Overall, Iran's position in international indicators of gender equality and domestic statistics on the low share (18.6%) of women in managerial positions in the Iranian public sector

(as mentioned earlier) highlights the need to examine and identify barriers promoting women to managerial positions in Iranian government organizations. Therefore, considering the importance and necessity of women's presence in critical managerial positions and political positions, the obstacles and challenges of appointing women to managerial positions in Iranian government organizations are examined and discussed below.

### Barriers to Promoting Women to Managerial Positions in Iranian Government Organizations

One of the significant issues of Iranian public organizations is the incompatibility of women's position with their competencies and knowledge (over qualification). Several factors can play a role in this regard; in the following, we try to discuss some of these.

Individual-family barriers: lack of support from husband and children, conflict of women's roles, the priority of mother and wife over organizational roles, lack of women's self-confidence, lack of motivation for promotion, lack of women's self-confidence, lack of managerial skills, double responsibility of women, and lack of support for each other are individual-family barriers for the promotion of women to managerial positions (Molaei et al. 2020). The importance of conflict of women's roles is described below.

### Barriers Related to Role Requirements

In most cases, women who work have three roles at the same time: wife, mother, and employee (Taghizadeh et al. 2012). Women's dual responsibilities, within their family and in their professions, are challenging for them. Women who have succeeded in achieving academic or professional degrees often face cultural barriers in the form of their inner perception of their role and the expectations of others. Mainly, their dual responsibility as spouses and mothers on the one hand and experts, on the other hand, are seen as the causes of all problems. In some cases, the traditional role of women is undoubtedly accepted, and their professional role is of secondary importance. "Women are the victims of the conflicts of experts about women's status and demands" and ultimately, they are ambiguous in recognizing the priority of their roles.

Some scholars focus on women's role in family, and some believe in the full participation of women in various political, economic, and social activities. The others believe achieving sustainable development is possible just through this participation. In such contexts women become skeptical, and this misunderstanding of the roles of women and the expectations of society has led them to fear work-life imbalances, anorexia, and lack of motivation to hold managerial positions. In such situations, the expert women face much pressure to adapt to their professional and traditional roles. Such a situation can reduce women's job satisfaction (Soleimanpour Omran and Shirazi 2017). Women often have slow career advancement because of interruptions due to pregnancy, childbirth, and childcare, and hence do not accept senior positions.

### Sociocultural Barriers

Sociocultural barriers refer to false and negative public attitudes, inappropriate values and norms, and general cultural attitudes and beliefs that prevent women from achieving managerial positions. In Iranian society, there is a traditional view about women's functions and a patriarchal culture in the family. Although both men and women work outside the home, women are responsible for the burden of household chores, while men are the breadwinners. Regarding Iranian culture, women are considered as the second sex, while men are considered superior, and even there exist cultural stereotypes for determining female and male duties (Molaei et al. 2020). Although a significant number of women act in different social, economic, and educational arenas, still in some families, the traditional and old-fashioned idea of housekeeping prevails, and women are not supported to work outside the home. These problems have made women to have low self-esteem and sometimes not even believe in their abilities (Ahmadi Kohnali et al. 2013).

### Legal Barriers

Legal barriers are actions and decisions which have prevented women from gaining managerial

positions. Such barriers include extended maternity leave, protective laws, female citizenship of the spouse, the gender of policymakers, and legal weakness in decreasing discrimination between men and women (Ahmadi Kohnali et al. 2013).

### Political Barriers

Some obstacles affecting the promotion of women's management are political; the bargaining power of women in the legislature jurisdictions is low; the number of women in the legislature and government centers, as women representative of parliament or minister, is limited; thus, power of women in defending their rights and demands is not considerable. Also, unequal distribution of power between men and women in society, lack of political skills in women, male government structure, absence of women in power circles, the inability of women to lobby, lack of women among decision-makers and policy makers, lack of party affiliation and political affiliation restricting the presence of women in political affairs, keeping women away from influential people are other political obstacles (Molaei et al. 2020).

### Organizational Barriers

In public organizations, some barriers that restrict the promotion of women are: unwritten rules and regulations, lack of a transparent promotion system in the organization, lack of trust in women, the existence of a patriarchal culture in the organization, rejection of female managers by other male managers, absence of women in the organization's communication networks, and the organization's view of management as men's work (Molaei et al. 2020). The number of mentors at top levels to train female managers is low. On the other hand, male managers have little desire to coach women. Another organizational barrier is the patriarchal organizational culture, which is flounced by the culture of society and the stereotyped attitudes of decision-makers. As a result, all organizational mechanisms, as well as norms and values, are designed to support men and against women (Taghizadeh et al. 2012).

Management and leadership style can be another element, too. For example, one of the reasons of women's inappropriate position in organizations is the over-support they receive from their managers. Due to this unnecessary support they could not experience critical jobs. These managers appoint a woman in a "risk-free" job and do not give her an opportunity to utilize her all competencies. The managers think that promoting a woman to a higher position and probably if she fails in that position, will harm her, so they oversupport their female subordinates (Ghavami 2016).

Other organization barriers are communication, lack of delegation, the prevalence of manly terms in organizations, the multiplicity of men in organizations, the strong communication network of men, obstruction of female colleagues (Esmaeilpour and Tafaghodi 2017), lack of suitable career for women, lack of patterns of successful female managers, and lack of open communication between men and women (MirGghafoouri 2006).

## Conclusion

Iran is a country with about 83 million people, half of whom are women. This part of the society has an essential contribution to the growth and development of the country, and especially in recent decades, its role in various social fields has become more prominent. For example, the demographic change of women in education, health, and higher education in recent decades has been very significant. Out of approximately 13.4 million students, 6.5 million (almost half of them) are girls studying at different levels (preschool, elementary, secondary) (Statistical Yearbook 2018). Also, according to the same statistics, 3,794,420 students are studying in Iranian universities, of which 1,723,269 are women studying in various fields (engineering, medical, agriculture, social science, and art); of these, 304,418 are studying for a master's degree and 109,463 are studying for a doctorate. Also, 78% of the country's nurses are women. Such a change in the female population has grown significantly compared to previous decades. However, the manner and extent of women's participation in other areas has been

different. According to the reports of the statistics center, in a population of 40.2 million women, 33.3 million are of working age. Of these, 5.4 million are economically active women. In other words, 28 million people are economically inactive, three-quarters of whom are housewives. According to the same statistics, 20% of these economically active women are studying, and only 1.3 million people have full-time jobs (Statistical Yearbook 2018).

On the other hand, a significant portion of this number of women works in the public sector. However, various issues make it difficult for these women in the public sector to manage their careers and, compared to men, they may not be able to use their abilities, skills, and competencies in their jobs as they should and women do not work in jobs and positions commensurate with their capabilities. This approach is the presence of 12,209 female managers in 2019 at the middle level and 67 at the top management level, which of course, compared to the year 2017 (9034 people), has grown by 25%.

Numerous influential factors were discussed in this entry in the form of barriers to promoting women. Some of these obstacles are related to the political, economic, historical, and cultural characteristics of Iranian society, and some of them are individual factors. Given the demographic changes in Iran, in terms of the number of educated women, especially in higher education, and the change in the new generations' expectations, Iranian policymakers must provide a suitable platform for the activities and comprehensive growth of this segment of society. In this way, this vital capacity for the country's development will be exploited and the goals and expectations of women in society will be achieved.

## Synonyms

Abberrance; Deviation; Divergence

## Definitions

**Positive deviance:** refers to a behavioral and social change approach which is premised on the observation that in any context, certain individuals confronting similar challenges, constraints, and resource deprivations to their peers, will nonetheless employ uncommon but successful behaviors or strategies to achieve their objectives.

**Deviant employees:** is someone whose behavior falls far outside of organization norms.

**Constructive deviance:** voluntary behavior that violates significant organizational norms and thus contributes to the wellbeing of an organization, its members, or both.

**Policy:** a course or principle of action adopted or proposed by an organization or individual.

## Introduction

Organizations have employees who tend to deviate from norms, come up with different ways of doing things to increase their competitiveness. The effects of deviant behaviors in the organization have economical, sociological, psychological, and anthropological implications. Positive deviance (constructive deviance) is a behavior that deviates from the norms of the reference group and has positive effects on the organization. It is an endogenous source of organizational creativity that has been shown to be powerful tool for learning and change. It is positive in terms of intention, effects, and conforms to hyper norms. It is not harmful to other employees or organization as a whole.

The fundamental success of the positive deviance approach depends on getting the organization to: define its own problem based on context, develop and use its own information to discover the scale of the problem and any positive deviants, determine whether the successful practices are in detail to be understood by other employees, design practical ways of spreading and sharing these practices among the employees, and disseminate the practices among other employees to replicate them.

Positive Deviance can be used when a problem meets several criteria, which are (1) the problem is not merely technical, (2) that other solutions have not worked, and (3) that there is a commitment in the organization/community to address the problem (Pascale et al. 2011). Within Positive Deviance, the focus is on the positive outliers of the normal distribution. The Positive Deviance approach challenges managers to think outside of the dominant frameworks. Therefore, the Positive Deviance approach is an asset-method.

The organization policies guide the individual behavior and practices to have harmony. Positive deviant behaviors have a greater tendency to resign, and develop stress related problems and low morale because their ideas may not be accepted by management and fellow employees. Positive deviant employees tend to experience low self-esteem, an increase in fear and lack of confidence at work, as well as physical and psychological pain. Together with these negative outcomes, deviant behaviors of employees can also be functional and constructive. For example, violating organizational norms by demonstrating deviant behaviors can serve as a source of innovation and creativity, thus contributing to the organization's competitive advantage as well as to the societal well-being.

## Constructive Deviance

Constructive deviance is voluntary behavior that violates significant organizational norms and thus contributes to the well-being of an organization, its members, or both. Despite the fact that these behaviors are sometimes impermissible by the managerial level, they assist the organization in achieving its objectives. These behaviors can be divided into two main categories. The first, interpersonal constructive deviance, is directed at individuals and comprises behaviors such as disobeying managerial orders in order to improve organizational processes. The second, organizational constructive deviance, is directed at the organization and comprises two types of behaviors: innovative behaviors aimed at helping the organization finding creative ways to solve problems and behaviors that challenge existing norms in order to help the organization breaking rules in order to solve clients' problems. Constructive deviance does not embarrass the employee and hence enables direct measuring through self-reports.

## Attributes of Positive Deviance

### Uncommon Practices

Uncommon practices and disagreements create freedom among employees to make use of their ability and judgment innovatively, even when they deviate from the norms (Albanna and Heeks 2019; Kibirango et al. 2018). When employees deviate from the norms, they are capable of boosting their creativity while addressing prevailing challenges, generate more spontaneous ideas, come up with new experiences, and venture creations. Uncommon practices develop a high degree of resonance interaction and not predation that requires individuals with different backgrounds, sets of experiences to connect in a very meaningful way to access resources from entrepreneurial networks. Mertens and Recker (2017) argue that a common assumption in most of these studies is that divergent opinions emerge spontaneously with elements of the environment, the person or the interaction between both making this emergence more or less likely. However, Hendryadi and Suryani (2019) argue that leaders can also actively stimulate divergent opinions, where managers have leadership skills, which may not be the case among small-medium organizations in developing countries because of bureaucratic culture.

In this case, heterogeneity, the vast diversity of components, agents, and parts involved in an ongoing variety of distinct interactions with others, is one of the important features of complex leadership systems that manage employees with uncommon practices. This is true for an organization with the presence of leadership that can operate and coordinate different individuals with different background and informational differences. This is still a challenge among small organizations with individuals who happen to possess

opposing view-points since it is difficult to challenge the structures of small-medium organizations where the business owner is likely to be part of every decision made.

### Novelty Experiments

Novelty experiments can produce unique experiments that have the potential to become seeds for unprecedented organizational action. Innovative behavior or tactics are evaluated, scrutinized, and tried before they are made accessible to all or considered for implementation. Creativity and problem solving are important elements of action that enable the emergence of novelty. The novelty to be successful, rules are changed in ways that enable the convergence of disparate, sometimes conflicting individual perspectives, preferences, and activities into effective and predictable collective action (Mayanja et al. 2019). During periods of uncertainty, reinforcing feedback is offered to certain process fluctuations through amplifying actions that seem to offer promising new ways to bring back stability. In this way, new structures grow through the gradual accretion of constructive deviations that work. Experiments to acquire resources produce information; feedback (under promising conditions) leads to significant expected value with regards the resources that could be discovered. This positive feedback loop is generative of possible future ecological niches for the system. However, if risks and rewards are not properly recognized and modeled, this feedback may end up not being beneficial to the organization.

### New Knowledge Values

New knowledge values is when employees observe how new ideas, knowledge, and innovations are formed from divergent opinions in an institution. Employees who notice and observe how new ideas, knowledge, and innovations evolve are likely to attach different meaning to information. Without new knowledge value, employees with no differences, social network agents would disseminate more of the same information along the network (Mayanja et al. 2019). The new knowledge value created by management and employees help in identifying new opportunities, which are exploited using the interactions, ties, and networking style within a social network. When managers and employees share with one another information and meaning attached to differences in perception, this is likely to influence the choices and actions that connect people and create new knowledge. However, Bohnet and Saidi (2019) argue that differences in absolute informedness may not be associated with performance differences. Instead, informational differences can have an effect on performance only when subjects are differently treated, and the seemingly less well-informed subjects perform significantly worse.

Organizations do have positive deviant employees who can contribute to competitiveness of any entity. This may happen when leadership creates enabling environment for the employees to act with autonomy in mind. Positive deviants need conducive environment for:

#### Acceptability

Positive Deviance is an innovative approach that enables organizations to discover their inherent wisdom. All members of the organization have the opportunity to contribute to the solution and broader adoption of the solution. The Positive Deviance approach strives to accomplish sustainable behaviors through interactions and feedback by identifying new ways of solving problems and accessing resources from different social and business networks. Positive deviants are more capable of promoting behavior change, because they are not inhibited by differences in experiences or culture (Frese and Gielnik 2014). The positive deviants face the same challenges and barriers and share the same norms and values as the nonpositive deviants. Therefore, nonpositive deviants can identify themselves with the positive deviants, because *"if they can do it, we can also do it."* Therefore, positive deviants serve as role models for nonpositive deviants. This implies that the solutions of the positive deviant role models are more solutions proposed by experts, which results in the second premises of Positive Deviance.

### Competitiveness

Employees with divergent views come up with unique solutions to the problems through learning from each other. The solutions of positive deviants are based on the available resources within the organization, social, or business network. Therefore, solutions remain feasible which makes positive deviant solutions more sustainable. This results in the third premises of Positive Deviance.

### Adoption

Positive Deviance is a peer-based learning process through individual interactions. In the Positive Deviance approach, the manager creates a conducive environment for employees to learn from each other through feedback. The manager facilitates all stages of the Positive Deviance approach (Bhattacharya and Singh 2019; Pascale et al. 2011). The stages of Positive Deviance cover the identification of the needs in the organization, the problem, and the positive deviants. Moreover, the uncommon behaviors and/or practices of the positive deviants are discovered, which is often called the Positive Deviance inquiry. Thereafter, interventions are designed based on the results (van Dick and Scheffel 2015). In the intervention, nonpositive deviants should learn the micro-behaviors from positive deviants, which is related to peer-based learning, and practice the new ways of doing things together. One of the principles of Positive Deviance is that "*you are more likely to act your way into a new way of thinking than to think your way into a new way of acting*" (Pascale et al. 2010, p. 38). This implies that adopting new behavior is more feasible through modeling than through knowledge transfer, which results in the first premises of Positive Deviance.

## Positive Deviance as a Management Method

Organizational behavior literature shows that there is a greater likelihood that employees engage in positive deviant behaviors once they are psychologically empowered in the working environment. Cameron and Spreitzer (2011) state that psychological empowerment is likely to be a key enabler of positive deviance. They posit that an empowered mindset is critical for adoption. Empowerment enables employees to participate in decision making, helping them to break out of stagnant mindsets to take a risk and try something new. Organizational behavior researchers point out that the pervasive influence of norms provides a means of control over what people say and do. Positive deviance requires real risk, and it requires departing from norms in a positive way often making others uncomfortable. In other words, when companies empower their employees, they are more likely to engage in risk-taking behaviors that depart positively from the norms of the organization in a way that is beneficial to the organization. And companies making their employees empowered have led to much financial and psychological gain: supervisors who report higher levels of empowerment are seen by their subordinates as more innovative, upward influencing, and inspirational. Despite organizational acceptance of positive deviance, as a management method, has not been explicitly investigated.

There are research and practical gaps in positive deviance knowledge within the arena of organizational science. First, the underlying mechanisms of positive deviance methods which give rise to claims of endogenous innovation success remain a subject of future research. More especially issues related to willingness to adopt, ability to adopt, and capacity to reward. This is a necessary step to realize the potential of positive deviance as a concept, without which the concept has limited practical utility and fails to fulfill the requirements of engaged scholarship.

Second, it is widely recognized that deviance can have deleterious outcomes as well as positive outcomes. Hence, management may be reticent to encourage rule-breaking as a means of innovation, compounding the importance of providing clearly elucidated mechanisms by which positive deviance operates as a form of endogenous innovation. Positive deviance has merit as a management

method for innovation. Namely, management potentially tolerates deviance from both formal and informal norms as a means of endogenous innovation. Management is likely to be more accepting of informal deviance than formal deviance because controls are varied and differ from individual to individual and group to group (Vadera et al. 2013).

Positive Deviance can be majorly categorized into formal and informal. Formal deviance is a behavior that violates social norms, practices, or policies of an organization. Informal deviance refers to violations of informal social norms, which are norms that have not been codified into policies. Management may be reluctant to discuss informal deviance relative to formal deviance. This reluctance could not be attributed to negative evaluation of the deviant behavior, itself, as both informal and formal deviance are often viewed positively as well as negatively. Hence, it is argued that reluctance may be indicative that management perceives formal breaches as an indicator of management failure, whereas informal breaches are not. The ultimate evaluation, then, depends on the reference group judging the behavior (management) and their perception of the behavior rather than the objective behavior itself.

## Challenges of Managing Positive Deviants in Developing Countries

In developing countries, small-medium organizations face a challenge of managing employees with deviant behaviors since they have a greater tendency to resign, develop stress related problems, and have low morale. They sometimes experience low self-esteem, an increase in fear and lack of confidence at work, as well as physical and psychological pain. This normally happens where innovations and resource allocation are highly controlled by top management.

Employees may not be willing to adopt positively deviant behavior based on the premise that the norms and policies in the organization promote resistance to change to adopt new complex behaviors.

Organizations may not have results-based credibility to measure behavior-based view of positive deviance. These judgments may invoke cognitive and/or affective resistance to change, limiting willingness to adopt. The implication is that good ideas may be disregarded if they are not perceived as positive and/or the source is not trusted, making them unable to generate intrinsic motivation and credibility.

Ability to adopt behavior-based and outcome-based approaches to positive deviance is a challenge. Specifically, positive deviance assumes that positively deviant behaviors can be implemented by all organizational members owing to commonality in goals, resources, and constraints which may not be the case.

## Recommendations

Organization leaders should create enabling environment for error and trail. Employees should be given freedom to make experiments guided by policies. In case an error is made by positive deviant employee, management should focus on the process of learning from the mistakes and how to improve on the new generated ideas without punishing the employee since it kills initiatives. The organization systems should accommodate information sharing and error management.

Managers can stimulate the emergence of positive deviance by deviating themselves and encouraging employees to learn from errors by rewarding and scaling good practices. Individuals that positively deviate stimulate positive deviance in their teams.

Managers that consistently reward, reprimand, and that keep a tight control over processes, yet at the same time invite employees to actively participate in design making and optimizing work design, are likely to stimulate the highest degree of positive deviance.

Nurturing positive deviants require an enabled, adequate, and favorable internal working environment with a certain degree of freedom and exercised tolerance of trials and error. In this case, organization managers ought to provide a flexible platform for enhanced rational thinking

and learning. Positive deviance is used to develop interventions and implementation process based on the successful behaviors and strategies of individuals at risk. Despite their circumstances, they perform better than their peers did.

## Conclusion

Acceptance is highest and broadest when management embrace deviance from both formal and informal norms. However, formal deviance is monitored more closely than informal deviance and, if considered undesirable, will be discouraged using relational governance. Organizations that manage Positive Deviance well are likely to remain competitive because of their continued innovations.

| Positive Emotions | Positive emotions are described as the desirable or pleasant situational response of an individual. These are basically the |

P

positive feelings of an individual triggered through social interactions mean reciprocal mechanism awake in the brain.

## Introduction

Public sector-related organizations are facing a real challenge for motivating its employees in such a way to engage in work-related activities. A survey was conducted by Gallup in 2013 and revealed that in Pakistan only 13% workforce is actually engaged in their work-related activities. This percentage is 50% less, as compared to Canada and the United States which have been identified as developed countries. Such percentage is damaging the performance of public sector-related organizations where employees are having the secure permanent job status. Due to this permanent status, they are continuously involving themselves in procrastination and non-work-related presenteeism. Hewitt Quarterly presented another study which is stating that if the organization is achieving high engagement rate of its employees than its mean, the organization is 78% productive and 40% profitable than those with low engagement rate. For a developing country like Pakistan, 13% engagement rate of employees is alarming and can create a real problem even for survival of organization. Recent economic report suggested that debt of most of the public sector-related organizations of Pakistan has increased in the current year. One of the main reasons of increasing in debt is the disengagement tendencies of workforce. It is imperative for the organizations to identify the facts which are hindering the engagement tendencies of public sector of Pakistan. The current study is focusing on the relationship of positive emotions and employee engagement because Pakistan is having the collectivist culture society where the people got effected from the emotions. Moreover, individual's emotions emerged through the close interaction with leaders or supervisors. The current study is focusing on the positive emotions which are invoking as a result of leaders specifically authentic leaders. Common positive emotions which are emerging in the result of interaction with supervisors or leaders are happiness, elevation, pride, compassion, and gratitude. At workplace individuals feel elevated when they are getting something from their leaders or supervisors which is morally accepted. Happiness emotion depicts that the individual is overall satisfied with the performance of their leaders. Pride emotion emerged when individuals feel sense of achievement by having the relation with leaders. Compassionate individuals show passion about the relation with leaders/supervisors and reciprocate it toward their co-workers. Gratitude emotion can be found when an individual is having the feeling of being thankful to the organization's initiatives or leaders' initiatives. These emotions have the potential to predict the positive attitude such as engagement, satisfaction, and commitment. Besides all other attitudinal dimensions, since the current study is highlighting the issue of employee engagement in public sector organizations, it has filtered out other attitudes and took employee engagement as prime concern.

## Positive Emotions

Positive psychology is showing deep concerns for identifying and studying antecedents and outcomes of positive emotions. Before accepting the importance of emotions at workplace, organization practitioners emphasized that the emotions are hazardous and distracting mechanisms which are effecting the employee's performance. They concluded that the emotions should be separated from employees at workplace. With the advancement of knowledge and shifting of thoughts, organization practitioners identified that emotions cannot be separated from employees at workplace; rather it can have positive outcomes at organizational settings in terms of adopting positive attitude and behavior.

Positive emotions are having the influential role specifically in maintaining the working relationships because it helps the individual to envision challenges and goals, and it can open the mind of individual to solve the problem, important for resilience and attachment with others, and

foster to adopt positive behavior important for self-regulation. In line with the thoughts, Fredrickson (2001) concluded that the positive emotions are not just the end state; rather it helps to improved well-being and in achieving the psychological growth. Despite the importance of positive emotions, it is still a myth for categorizing different emotions into one broad category titled as positive emotions. Recent systematic review of Fehr et al. (2017) presented a table which is categorizing positive emotions as compassion, happiness, pride, elevation, and gratitude. These positive emotions are having the potential to develop and tailor the attitude of employees such as engagement and adopting citizenship behavior.

## Types of Positive Emotions

### Gratitude

Individuals with gratitude emotion generally display the feelings of thankfulness for someone, something accompanied by humility.

### Pride

A sense of approval of oneself and pleasure emerged due to the personal attributes, skill, or achievement.

### Elevation

The elevated emotion invoked when individuals see someone engaging in the act of kindness, goodness, and generosity and impelling them to reciprocate the same action.

### Compassion

The one who is having the feelings of care, kindness, and willing to help others is known as the compassionate individual. Compassion feelings derive the individual to help out others when they are suffering from any circumstances.

### Happiness

Happiness is a general enjoyment sense and enthusiasm for life, feeling of contentment, and pleasure on the basis of things that are going.

## Antecedents of Positive Emotions

Researchers identified the importance of positive emotions in development of positive attitude. Before identification of outcomes, psychology-related researchers presented different theories which are explaining the antecedents of positive emotions. For example, Isen et al. (1987) identify flexibility at workplace creates environment for emergence of positive emotions. Roseman (2001) investigated and concluded normative significance, controllability, expectedness, goal conduciveness, goal congruency, and valence which are the elements of cognitive appraisal, and these cognitive appraisals are identified as potential antecedents of positive emotions. Goetz et al. (2010) further expanded the research and added perceived control and perceived values as antecedents of positive emotions. Control-value theory of emotion defined a comprehensive environment consisting on instruction, support, autonomy, goal structure, expectations, relatedness, and feedback achievement as the triggers of positive emotions. Psychologists defined that the individual personal resources or psychological resources are very important for developing of positive emotions because of affective component where personal resources are the psychological capabilities and capacities, psychological capital, and well-beings. In organizational settings the role of human faces of an organization can have a significant impact on development of positive emotions. These human faces are generally interpreted by researchers as direct supervisors. Despite the plethora of research that have been conducted on the positive emotions, there are some unexplored avenues available which need to be attended by the researchers and scholars around the world. For example, the role of supervisors and leaders is very important and inevitable in the process of generating positive emotions. Positive leadership style is materialized as the most influential style for adoption of positive psychological resource of followers. Among all other positive leadership styles, authentic leaders are the leaders who can have the influential role in generating positive emotions because of the nature and construct (Avolio and Gardner 2005).

Initial theory of authentic leadership explored that the authentic leaders are the best source of generating the positive emotions in individual through the process of identification (personal and organizational) vis-à-vis trust. The process further leads to adoption of positive attitude and behavior which is important for organization. Broaden-and-build theory also supported that the social relationships and social bindings are very important for displaying a positive emotions whether these bindings are resultant from organizational policies or getting the support from the immediate bosses (leaders or supervisors). The mentioned organization policies or supportive activities from supervisors or leaders cannot work in isolation rather through the comprehensive process because emotions are the individual psychological resource which can invoke through the comprehensive mechanism. For example, authentic leadership theory is suggesting the authentic leaders affect the identification feelings of individual which further leads to the positive emotions, and these emotions further lead to the attitude of employee.

## Outcomes of Positive Emotions

Positive emotions record certain outcomes noticed from the practitioners and research scholars. It was widely accepted that positive emotions have a significant role in creating and developing a positive attitude of employees specifically at workplace. Cohn et al. (2009) revealed that the positive emotions increase overall life satisfaction through building the resilience in employees. Havens et al. (2018) identified that positive emotions significantly affect work engagement and satisfaction. Zivnuska et al. (2019) linked positive emotions with employee performance and concluded that the employee's performance can be achieved through emergence of positive emotions. It has also been identified that employees with positive feelings (emotions) posit engagement tendencies and increase employee commitment level toward the organization at workplace. Based on the facts, positive emotions in psychology literature got tremendous attention and are identified as important mechanisms for adoption of positive attitude. Cropanzano and Mitchell (2005) acknowledged that at workplace individuals who are getting the socioemotional and economic resources tend to have the satisfied feelings which lead them to engage in work-related activities due to the reciprocal mechanism as they are posing what they are getting from the organization. They are basically repaying the organization in the shape of engagement which they are receiving from the organization. Employee's attitude consisted of the three components, namely, affective, cognitive, and behavioral components, where affective components are the emotions of employees generating through the positive organizational initiatives and these emotions lead the employees to engagement in accomplishment of organizational goals. Based on the categorization of positive emotions, it has been identified that the happiness emotion has a significant impact on the career-related outcomes (Boehm and Lyubomirsky 2008) at individual level, increases job satisfaction, increases organization commitment, and increases engagement tendencies of an individual at workplace (Mathieu and Farr 1991). Happiness emotion is also identified as a driving mechanism for adoption of positive attitude at an organizational place. Rego et al. (2010) linked happiness with employee's extra role behaviors such as increase in contextual and creative performance. Employees with happiness emotion are the real asset of the organization because they give their best in response of organizational initiatives to make them happy. They tend to engage themselves in work-related activities rather to procrastinate their tasks. Happiness emotion can create a better working environment where employees put their best to increase the performance of organization by engaging themselves. In the category of positive emotion, another emotion is pride which is related to the self and defined as the pleasurable emotion resulting from actions that described that the self of individual is goofy, virtuous, and competent. It is having a significant impact on adoption of positive attitude (engagement, commitment, and satisfaction) at workplace. Researchers explored and concluded that the

emotional drivers such as employee's relationships with their leaders or managers invoking pride emotion which triggered them four times greater to put the discretionary efforts to complete their tasks means greater engagement. Researchers also identified that pride emotion is the most influential emotion of an individual to put extra energies to perform the tasks. Compassion emotion is another emotion coming under the umbrella of positive emotions. It takes place when individuals identify any other individual in some sort of suffer. Compassion can be defined as "individual emotional response of caring for and wanting to help those who are suffering" (Weng et al. 2013). Compassion has the power to generate the positive feelings in employees which ultimately leads them to increase the engagement at workplace. Cameron et al. (2003) provided a strong link for compassion and creation of upward spiral of positive feelings (engagement) toward organization and its members. Compassionate employees tend to have the focus on achievement of organizational vision and mission by putting discretionary efforts like helping others (co-workers) in achievement of tasks. The study of Kahn and Heaphy (2013) with the relational context got significant results of the relation of compassion and employee engagement. These results encourage to define the relationship of compassion and employee engagement which means that if the employees feel compassion at workplace due to certain antecedents such as relationships with supervisors or organization initiatives, then they tend to engage themselves in work-related activities. Gratitude emotion is the second last emotion which has been selected for the current topic, and it has been defined as the individual's feelings of appreciation in response to an experience that is beneficial to, but not attribute to, the self. It can generate the positive feelings about the organization or leaders and due to those feelings can result in the engagement in the achievement of assigned tasks. The researchers, e.g., Whetten (2007) and Robbins and Judge (2003), found gratitude as an important precedence of employee engagement. Employees being thankful or having gratitude emotion show great emphasis on the engagement (Froh et al. 2008). The last emotion in the category of positive emotions determined is "elevation." It has also been categorized as moral emotion, and it can emerge when an individual is experiencing or seeing that an action of the person deems morally virtuous (Siegel et al. 2016). The employees with elevation emotion generally try to reciprocate to be virtuous, and for the purpose they put their efforts by engaging themselves for betterment of the organization. Meyer and Peng (2016) published a book titled *Handbook of Employee Commitment*. It consisted of the thoughts that elevated employees known as more engaged and committed workers in organization. Initially, Fredrickson (2001) provided a stem for the relationship of elevation emotion and employee engagement in the context of broaden-and-build model. Later on the said researcher presented a famous broaden-and-build theory which is also supporting that employees at workplace with elevation emotions are identified as more engaged workers.

## Conclusion

Today in the competitive environment, organizations are focusing on the effective utilization of the resources. Human resource is one of the important resources which determine the success or failure of the organization, and the focus of organization has also been shifted form top-down approach to bottom-up approach. Bottom-up approach has the strength to work as motivational mechanism for human resource. Moreover, with the advancement of technology and blending discipline of psychology in management, organization accepted the importance of emotions which cannot be separated from employees. It was explored and accepted that emotions can provide help in adoption of positive feelings (attitude) like engagement, commitment, and satisfaction. So organizations need to identify and implement the strategies which are helping in the development of positive emotions. It is imperative for the organization to focus on the employee's attitude so that they can give their best which further leads to behavior that drives

through organization success in a competitive environment. For instance, the current topic focused on the positive emotions which are further categorized as happiness, pride, elevation, compassion, and gratitude with the relationship of employee engagement. Further the content used in the context of public sector organization shows engagement rate of employees is comparatively low and requires attention from the practitioners, researchers, and policy makers.

# Positive Leadership Behavior

Sara R. Jordan
Center for Public Administration and Policy, Virginia Polytechnic University and State Institute, Blacksburg, VA, USA

## Synonyms

Authentic leadership; Positive organization

## Definition

Positive leadership behavior is a set of actions, taken by individuals in a position of power and influence, to motivate and cultivate others through mechanisms of empowerment, engagement, and collaborative assignment to meaningful work. Positive leadership behavior promotes happiness, well-being, and mindfulness as goals for

organizations that are as important as profit, achievement, and winning in competitive situations, like markets and contract award.

## Introduction

What makes a good leader? The long history of political philosophy, studies of leaders, and studies of organization suggest that good leadership is that which is effective at motivating individuals to do those acts which would they would not ordinarily do. Over the course of time, our concept of leadership has changed from a leader motivating individuals into battle, to leaders motivating individuals to engage in repetitive productive tasks during the Industrial Revolution, and finally to leaders motivating individuals to become productive by being self-aware. While leaders in the Industrial Revolution were overwhelmingly concerned with employees only as productive units, in the current organization environment, leaders and managers are concerned with creating an ecosystem of positive influences that direct the whole person to play an active and meaningful part in a productive community.

One of the notable artifacts of this change from an industrial model of leadership to a positive model of leadership is the change in the orientation of leaders toward their subordinates and to themselves. As Staw and Barsade's (1993) research showed, there is "more support for the 'happier-and-smarter' than the 'sadder-but-wiser' approach to leadership." Positive leadership theories, and the instantiation of that in positive leadership behaviors, seem poised to be the next wave in the elevation of the manager-employee and leader-led dyad.

## Positive Leadership

Positive leadership behavior is part of the study of positive organizations. Constituting a set of actions taken by individuals in a position of power and influence to motivate others through four mechanisms – modeling positivity, empowerment, engagement, and cooperative assignment to meaningful work – positive leadership behavior promotes excellence, enthusiasm, happiness, well-being, and mindfulness as goods for organizations that are as important as profit, achievement, and winning in market competition situations. According to this definition, positive leadership behavior has some important characteristics that distinguish it from negative leadership behavior or abusive leadership which is described below.

First, positive leadership is active rather than reactive or stationary. As defined by positive leadership scholars Youssef-Morgan and Luthans, positive leadership is:

> the systematic and integrated manifestation of leadership traits, processes, intentional behaviors and performance outcomes that are elevating, exceptional and affirming of the strengths, capabilities and developmental potential of leaders, their followers and their organizations over time and across contexts. (2013, p. 201)

Taking off from earlier discussions of leadership as management by walking around and other managerial engagement theories, positive leadership behavior encourages leaders to be visible actors working to effect change at the organizational level through active work at all levels of the organization (Peters and Waterman 1982). Positive leadership would include work by leaders on the enhancement of line workers' skills as well as self-referential work on balance, flow, and leadership as learning. Second, while positive leadership behavior retains the characteristics of classic leadership – power and influence – positive leaders use power to empower or to promote quality, strengths, and virtues of the organization and its people. That is, the positive leader focuses his/her attention on building power in others. Similarly, positive leaders seek to influence others not through rhetorical devices or threats but through engaged argument and deliberation. For example, positive leaders do not deliver orders or edicts through disengaged channels (e.g., notices of changes to SOPs) outside of employee's normal communicative platforms but provide opportunities for question and answer in small and large groups, often in a natural work setting (Spreitzer 1995).

Third, positive leaders seek to motivate others to create meaning as well as create products or services. Positive leadership practitioners seek to create spaces to give employees the sense of being part of a meaningful and engaged work life. One technique for doing this is encouraging customer and employee interaction so that employees can share in the customer's enjoyment of the service or product. Another technique is to model positive behaviors, such as confidence, hope, resilience, and self-efficacy.

Fourth, positive leaders seek diversity and inclusion in their organization and its practices. Employees and leaders representing a diversity of viewpoints and lifestyles are encouraged to give voice to concerns which ideal positive leaders seek to incorporate into their decisions and branding strategies.

Fifth, positive leadership behavior includes creating clear goals and missions for organizations and employees. This includes creating architectures for individual success through which employees can rise within the organization or may even change their career paths to satisfy desires for individual learning and development.

## Is There Negative Leadership Behavior?

New concepts like positive leadership behavior can be explicated by comparing it to its opposite or its absence. We can characterize that negative leadership behavior is that which is inactive, reactive, or disengaged or motivates individuals through negative psychological effects such as fear, aggravation, intimidation, and/or the negation of the importance of the employee themselves. Classic theories of leadership which incentivize leaders to homogenize employees or to reduce employee variation as a mechanism to improve productivity output or productivity success are also instances of negative leadership behavior.

Negative leadership behavior is often stereotyped in popular culture as "bad bosses" who intimidate, threaten, verbally abuse, or psychologically abuse their employees in order to try to motivate them to perform unclear tasks. While there are few sustained theoretical and empirical studies of abusive and counterproductive leadership, the works of Ashforth and Keashly and Duffy et al. coalesce around a set of themes such as: "petty tyranny [or a] manager's use of power and authority oppressively, capriciously, and vindictively" (Ashforth 1994), lack of consideration for individual emotional and physical integrity (Keashly 2001), and "social undermining [or] behavior that is intended to negatively affect an individual's ability to establish and maintain relations with others, work-related success and favorable reputation" (Duffy et al. 2002; from Starratt and Grandy (2009)).

## Origins of Positive Leadership Behavior

Positive leadership behaviors are socially engaged and, as such, fluid and move with context. However, these positive characteristics are also backed by a theoretical architecture that is tested, rigorous, diverse, and inclusive. Making individual and cooperative organizational meaning is part of the psychological thrust of positive leadership. Positive psychology, or the psychology of improvement and happiness over the psychology of impairment and syndromes or diseases that lead to suffering, promotes an agenda of flourishing and well-being. A positive leader attempts to create the conditions that promote well-being and happiness as much as he or she seeks to promote the conditions that create quality products or services. Positive leadership is also theoretically linked to the drive to create quality in product. Taking off from theories of production such as total quality management, positive leadership intends to use each individual's input to the system as a way of creating opportunities for improvement of the quality of the product being generated.

## Recent Research

### Theoretical

While there is no single theory positive leadership behavior, this framework is supported by multiple

theoretical perspectives. In addition to interdisciplinary perspectives, there are two clearly linked schools of positive organizational thought: positive organizational scholarship (POS) and positive organizational behavior (POB). Cameron and Caza (2004, p. 731) define positive organizational scholarship as "the study of that which is positive, flourishing and life-giving in organizations. Positive refers to the elevating processes and outcomes in organizations. Organizational refers to the interpersonal and structural dynamics activated in and through organizations, specifically taking into account the context in which positive phenomena occur. Scholarship refers to the scientific, theoretically derived and rigorous investigation of that which is positive in organizational settings." Positive organizational behavior has been defined by Luthans as "the study and application of positively oriented human resource strengths and psychological capacities that can be measured, developed, and effectively managed for performance improvement in today's workplace" (2002a, p. 59). Both positive organizational scholarship and the study of positive organizational behavior have roots in studies of positive psychology and management theories, like empowerment management and total quality management.

## Positive Psychology

What is positive psychology? Positive psychology is a new movement within the professional and scholarly field of psychology that emphasizes the study of well-being and happiness as opposed to the study of suffering and syndromes or diseases. Positive psychologists study how it is that people come to be happy, return to being happy after a setback, or inspire happiness in others. Positive psychologists also study how it is that conventional psychological issues such as mental illness or psychological syndromes lead to changes in well-being and happy effect among sufferers (Seligman 1998, 2002, 2011).

Three major terms capture the concerns of positive psychologists: well-being, flow, and resilience (Seligman and Csikszentmihalyi 2002). Well-being is not only a statement of a generally positive and undisturbed state of mind but also a state of flourishing that allows individuals to function well and with a sense of purpose. Positive psychologists studying well-being share concerns with political philosophers, like Martha Nussbaum and Amartya Sen, who are concerned about how public policy and government change the opportunities for citizens to achieve maximum flourishing. Flourishing or being well and living well is made up of at 10 capabilities that promote well-being. These dimensions of well-being can be promoted or hindered by external factors, such as public intervention, or by individual factors, such as mental disease or physical infirmity. In the context of organization, positive leaders should work to foster the development of capabilities, such as practical reason and play, among employees.

Flow is that state of being where individuals are able to practice meaningful skills easily with a sense of clear enjoyment. Developed as a theory by Mihaly Csikszentmihalyi, flow is a state of intense meaningful enjoyment that emerges when high challenge and high skill meet. In the study of positive psychology, theorists and researchers are curious to know the conditions under which flow happens whether those conditions are individually motivated or motivated by others. In the context of positive leadership behavior, the ability to inspire an optimum experience or flow becomes an important goal for managers to be able to inspire their employees. Inspiring flow involves allowing employees to develop their own skills well, or to actively promote the enhancement of such skills, and the presentation of new and innovative challenges to the skillful employees (Csikszentmihalyi 2014).

Positive psychologists are also concerned to study what makes particular individuals more happy than others despite the same setbacks. Concerns about grit or about resilience are pertinent to the study of positive psychology. Resilience or the ability to bounce back well or to even bounce forward after a setback is critical to the study of how individuals line and maintain happiness. The implications of positive psychology have been adapted to the study of psychological capital

(PsyCap) in organizations. PsyCap is argued to help those that have developed this skill to "confidently take on and pub in the necessary effort to succeed at challenging tasks... persevere toward goals and, when necessary, redirect paths to goals in order to succeed" (Youssef-Morgan and Luthans 2013, p. 200).

## Empowerment Management

Another area from which theorists of positive leadership behavior draw is what I will describe as empowerment management. Empowerment management seeks to distribute responsibility for generating new concepts, products, and ideas from the c-suite throughout the organization by motivating a sense of self-efficacy among all employees. Empowerment management asks employees to "get involved in activities and behave assuredly when they judge themselves capable of handling situations that would otherwise be intimidating" (Bandura 1977, p. 193; quoted in Conger and Kanungo 1988, p. 476). Empowerment management practices that produce greater self-efficacy for individuals include encouraging continuing technical and social education, creating collaborative cultures with high performance standards that are coupled with clear architectures of support, breaking down barriers and discriminatory patterns, and providing supportive feedback that invoke both formal and informal mechanisms of evaluation and praise.

## Quality Improvement

Total quality management is a concept that has been in the public and private management literature since the late 1980s. Associated strongly with the work of Deming (2000), total quality improvement seeks to use the knowledge and position of all employees throughout the organization to create the most consistent, high-quality products possible for that organization. Total quality management as a model of managerial behavior is akin to the ideas of empowerment management – empowering, encouraging leaders develop their employees and themselves to create an ecosystem of quality.

As noted in the famed "14 Points on Quality Management," leaders are encouraged to break down barriers, instantiate pride in workmanship and personal performance, and include all members of the organization in the process of creating value. Under the total quality management approach, leaders are encouraged to abandon "gotcha" and "investigative" strategies, such as audits, to gather data on employees, products, and performance. Instead, quality management leaders invite each employee to be deeply involved and openly appreciated as being integral to the quality process (Darling 1992). However, total quality management differs from empowerment management by focusing on the quality of the products in the end. Empowering management and positive leadership encourage leaders to think of the organization's output and also the input or the employees, their meaning, their work, and their happiness in the process of producing outputs and themselves.

## Recent Empirical Research

The theoretical architecture of positive leadership behavior supports a rich empirical literature as well through which theories and practices of positive organization are tested. Exhaustive catalogs of the literature in each of these domains can be found in key articles (Luthans and Youssek 2007; Youssef-Morgan and Luthans 2013) and through scholarly and popular websites such as those supported by the University of Pennsylvania (https://www.authentichappiness.sas.upenn.edu/) or the researchers associated with positive psychology (https://positivepsychologyprogram.com). The empirical work on the importance of positivity in organizations has led to formulations of recommendations and useful mnemonics for leaders. A few of these examples include promotion of organizational citizenship behavior, courageous principled action, and promotion of a HERO orientation to organization development and leadership.

> Hope is a positive motivational state that is based on an interactively derived sense of successful (1) agency (goal-directed energy) and (2) pathways (planning to meet goals and proactively identifying alternatives if obstacles are encountered).
>
> Efficacy is one's belief about his or her ability to mobilize the motivation, cognitive resources, and courses of action necessary to execute a specific action within a given context.
>
> Resilience is the developable capacity to rebound or bounce back from adversity, conflict and failure, or even positive events, process and increased responsibility. Optimism is an explanatory style that attributes positive events to personal, permanent and pervasive causes and negative events to external, temporary and situation-specific ones. Optimism also constitutes a generalized positive expectancy of the future. (2013, p. 200)

## Implications for Governance and Public Administration

The positive psychology movement has spawned a new way of looking at human motivation, mental fitness, and capability. This movement is constantly infused with new perspectives, theoretical architecture, and empirical analyses that can inform management in any organization, public or private. From the perspective of public organizations however, the positive organization scholarship paradigm and study of positive leadership behavior provide informative clues for assisting organizations and their clients. In particular, a focus on positivity, quality-focused action, managerial support for employees' achievement of flow, and the HERO dynamic may assist public organizations through trying periods such as executive turnover or public crises. With particular respect to nonprofit and voluntary organizations, positive psychology and positive organizational studies can help new and emerging leaders find new pathways to motivate volunteerism in general and retention of volunteers.

## Conclusion

Positive leadership behavior is but a small section in the growing field of positive organization studies. Based on the theoretical and empirical study of positive psychology, quality management, and empowerment management, positive leadership behaviors are those that encourage employees and volunteers to cultivate HERO and technical skills and achievement of a flow experience in meaningful work. The positive perspective also insists that leaders cultivate this same range of skills and experiences within themselves as a pathway to betterment of the organization. While there has been substantial empirical work on positivity in management for the private sector, the applications of this to the public sector are understudied. A new wave of positive leadership behavior studies should emerge from the public sector if this genre of scholarship is to advance.

# Postdisaster Public Procurement

John Kwesi Buor
The Business School, Ghana Institute of Management and Public Administration, Accra, Ghana

## Synonyms

Disaster management; Emergency public procurement policy; Postdisaster recovery and reconstruction

## Definition

Postdisaster public procurement refers to processes that focus on the laws, the policies, and practices that integrate economic, social, and environmental risks into public procurement processes and decisions aimed at meeting demand during emergency and the period thereafter.

## Introduction

Managing disaster of any kind/category can be quite a daunting task. To ease this task, writers (Hidayat and Egbu 2010; Khan et al. 2008) attempt to label the stages (phases or cycles) of disaster management in various ways, including: prevention, preparedness, response, mitigation, and recovery. Each of these disaster management phases may require different resources, different skills, and different regulations to govern the procurement processes. This chapter will focus on procurement for response, mitigation, and recovery stages. The reason being that whether an affected community will survive the scourge of a disastrous event, it depends on how well these three phases of disaster are managed in terms of the quality and quantity of resource flow. Knowing these cycles, therefore, can aid in the approach to adopt and the procurement strategies or processes to choose for implementation at a particular time.

Based on disaster timelines (Ergun et al. 2010), procurement activities for the disaster management cycles can be viewed from the angles of *predisaster procurement* and *postdisaster procurement*. The predisaster procurement (or procurement for disaster preparedness) can take a relatively long period in advanced preparation and is appropriate for speculative and slow-onset disasters. Its activities involve long term strategic planning including disaster drills, stockpiling of relief items, and training so that the response (i.e., dispatch and delivery) stage can become smooth. Contrarily, the postdisaster procurement (or procurement for emergency response, disaster recovery, and reconstruction) decisions are rather for faster, unforeseen, unplanned, and sometimes chaotic events. The focus is on procurement for the period immediately after a disaster event (i.e., disaster response), through to the reconstruction and mitigation phases. The reconstruction phase covers all efforts necessary to restore life and property to a reasonable level. It extends into preventing or reducing the consequential effects of disaster loss and future occurrence (mitigation). Furthermore, disaster recovery refers to the restoration,

and improvement (where appropriate) of facilities, livelihoods, and living conditions of disaster-affected communities. It includes efforts to reduce current and future disaster risk factors. Items procured at these postdisaster periods therefore should take advantage of the available opportunities to upgrade quality and capacity that can lead to sustainable development. Communities can leverage on such opportunities to transform their lots and restructure themselves to become both robust and resilient towards future events of similar nature.

The major challenge, however, is the urgency and multiplicity of actors, some of whom can be opportunistic. A thorough needs assessment is therefore required by national/local governments to define, lead, plan, and coordinate the procurement and supply of disaster operational items. The postdisaster recovery and reconstruction phase is a shared responsibility involving all stakeholders including individuals, private businesses and industries, state and local governments, and the central governments.

## Definitions of Key Terms and Relations

The United Nations (UN) defines "d*isaster,"* as a serious disruption of the functioning of a community or a society. It involves widespread human, material, economic, or environmental impacts that exceed the ability of the affected community or society to cope with, using its own resources. Similarly, the World Health Organisation (WHO) defines "*disaster"* as a vast ecological breakdown in the relationship between man and his environment, a serious sudden or slow onset disruption, on such a scale that the stricken entity needs extraordinary efforts to cope with it, often resulting in dependence on outside help, or on international aid.

Disaster can subject entities to physical, mental, and emotional consequences. However, for an event to be considered a disaster, it needs to be one which constitutes a threat, a disaffection to human beings, or what they depend on for survival. It suffices therefore to say that not all incidents are disasters, but their level of impact can be perceived as such. For example, if an earthquake or flood occurs in an uninhabited area which also does not pose a direct threat to resources required by humans, it may be considered a natural phenomenon, but not necessarily as a disaster. Generally, disasters are not declared by any ordinary entity, they are declared by a state authority in whom the power is vested and guided by an Act. From this perspective, it suggests that disaster management could refer to how a community deals with the human, material, economic, or environmental impacts of a particular disaster, including the processes involved in preparedness for, response to, and the lessons learnt from effects of major failures.

A disaster occurrence and its impact depends on three basic elements: the vulnerability of an entity and its environment; the magnitude of the hazard/risk; and the entity's capacity to counter the effect of that event depending on the level of preparedness. The basic mathematical relationship between the three elements could be expressed as "**Hazard (H)** multiplied by **Vulnerability (V)**, all divided by **Capacity (C),** equals **Disaster (D)** [i.e., **(H x V)/C = D**]." Perhaps, disasters themselves may not kill or cause the characteristic havoc as many victims may experience at a point, but the level of preparedness does. Thus, the focus of any disaster management activity should explicitly or otherwise, be directed towards ways by which the "**C**" (i.e., capacity or preparedness) component in the equation can be improved through strategic resource acquisition (i.e., procurement).

Procurement is perceived as all processes and activities involved in: the preparation of annual budget, estimating the needs by entities; planning according to budgetary allocations; and the executions according to budgetary plan. According to Laswell (1971), the term "*public*" refers to that which belongs to the general society/community, and "*policy*" means an important choice. A p*ublic procurement policy*, therefore, stand for all governmental activities leading to acquisitions, the choice of which can have influence on the lives of citizens. In simple terms, public procurement refers to the acquisition for public consumption (Weiss 1993) through structured processes and

activities. It is the avenue by which nation states and their agencies award contracts on behalf of the citizenry. This suggests that public procurement can be viewed as a tool, a mechanism, an instrument, or a lever, for promoting public policies such as industry and economic development, as well as an assistance to historically disadvantaged group. Public procurement policies also relate to principles such as transparency, probity/accountability, competition, and value for money. These principles are apparently linked to the desired outcome, or impact, of public procurement.

According to the Asian Development Bank (2011), "*public procurement*" is the process by which national and local public administrations establish and determine the needs for which procurement is required. It also involves: the formulation of appropriate procurement strategy to meet the needs; the solicitation of competitive bids from qualified suppliers as a means of determining best value and price; the selection of bids according to preestablished criteria; the award of contracts and ensuring the availability of a formal challenge mechanism; and the insurance that contract administration focuses on performance, cost, and timeliness. This view suggests that public procurement concept is not an event but a process and its subprocesses, as well as the series of actions which can lead to the accomplishment of a particular operation.

Apart from the traditional goal of acquisition of goods, works, and service, public procurement also performs nonprocurement goals. Governments have used public procurement to deliver social, economic, and environmental policies, in both developed and developing countries. For instance, public procurement can be used by governments to stimulate economic activity, protect national industry against foreign competition, improve the competitiveness of certain industrial sectors, and remedy regional disparities. Besides this, public procurement activities can also be engaged to achieve certain direct social policy objectives such as to: foster jobs creation, promote fair labor conditions and the use of local labor as a means to preventing discrimination against minority groups, protect the environment, encourage equal opportunity between genders, and promote increased utilization of the disabled in employment. Being the largest spender on resources, governments in most instances have often aimed to using public procurement to promote social, industrial, or environmental policies (sustainability issues). A well-designed public procurement framework, therefore, is capable of becoming a useful vehicle through which a government can strategically enhance its performance, quality of service, as well as empower its citizens economically.

## Public Procurement Principles, Structure and Policies

Under UN's regulation 5.12 (which seems to be benchmarked by many nation states' procurement reforms), the functions of public procurement include all actions that are necessary to carry out acquisitions by purchase or lease of a property, products, real property, services, and works. The said acquisitions need to follow the general procurement principles of best value for money; fairness, integrity, and transparency; effective (international) competition; and the interest of the UN (in this case the nation state, or the entity).

The achievement of the principles and outcomes of procurement can be functions of both structural and allocative policies. Structural policy centers on the sourcing strategies available as in a nation's procurement reforms/laws, including conditions under which domestic sourcing, dual sourcing, and other sourcing policies hold. On the other hand, allocative policy bothers on whom to benefit, or otherwise, from items being distributed during and after a disastrous event. As nations develop from distributive policy to regulatory policy stages, there is need to adopt reforms that can bring growth. Distributive and redistributive policies come under allocative policy, while regulatory policies are classified under structural policy (Salisbury and Heinz 1970). During emergencies, contracts are usually procured in minimal time but rather at high cost (or overcost). Procurement at minimal time often comes with problems relating to capacity and efficiency. Structural policies as in the procurement Acts

(or regulations and reforms) are evoked as contingency procedure while allocative policies guide the distribution of resources. By these policies, most advanced societies have relied on public procurement principles to curb corruption and undesirable outcomes. These laws, regulations, and structures must be established prior to event occurring.

Based on the number of suppliers involved, sourcing policies that can be adopted for disaster operations may include single sourcing, sole sourcing, dual sourcing, parallel sourcing, or multiple sourcing. Single sourcing refers to the *"fulfillment of all of an organization's needs for a particular purchased item from one vendor by choice."* Sole sourcing on the other hand is *"any contract entered into without a competitive process, and which is based on a justification that only one known source exists, or that only one single supplier can fulfill the requirements."* Ordinarily, these two sourcing policies (single and sole sourcing) confuse many and are applied arbitrarily especially in countries that are still undergoing public procurement reforms. The general similarity is that both single and sole sourcing policies are noncompetitive procurement strategies and are not permitted by statute, except where competition is not feasible. The difference, however, is that single sourcing intentionally chooses to purchase from only one supplier in the midst of many, while sole sourcing comes about as a result from supplier constraint (e.g., monopoly) where purchaser may have no other choice. Note that none of the two is particularly meant to be applied on disaster or emergency cases only. Multiple sourcing occurs where a buyer purchases identical part from two (dual) or more sellers. Parallel sourcing is a strategy where a buyer purchases conventional products simultaneously from a group of suppliers each of whom is specialized in a single product category (see Treleven and Schweikhart 1988). Apart from single and sole sourcing policies which are not opened to competition and which can be highly susceptible to uncertainties, risks of cost and quality, all the other sourcing strategies can be opened to competition and might be preferred in normal procurement conditions.

## Postdisaster Behaviorism and Public Procurement

In the aftermath of a disastrous event (postdisaster), particularly at the response phase, coordination of procurement processes and proper financial control becomes a major problem. The gap between demand and supply for resources can become extremely huge. Adherence to and the implementation of public procurement principles (i.e., fairness, transparency, accountability, and value for money) and the general procurement processes become more complex due to the unstably chaotic environment. The nature of the situation may lead to time becoming a scarce and most essential commodity. Also, it could lead to the relaxation of policy regulations, with the intent to improving responsiveness. Contracts might be awarded without competition; the principle of reasonable pricing while procuring becomes secondary in most cases; high tendency for misuse of resources due to time constraints may occur; and efforts which consider environmental concerns, employment issues, alternative welfare considerations, or the protection of domestic industry may not be given the needed priority because they may lead to suboptimality in responsiveness (see Schultz and Søreide 2008). The probable consequence of these outcomes could be a highly amplified bullwhip effects. For instance, there could be exaggerated hikes in demand for funding and resources, a rise in corruption and fraud as a result of uncoordinated, hurriedly procured, and uncontrolled financial environment. Other behaviors that may characterize postdisaster procurement activities include misapplication of discretionary authority by people entrusted with power, mismatching specifications against the desired resources, restricting bid invitations, political influences in award decisions, conflict of interest, and possible sale of contracts in some instances.

Postdisaster sentiments come with great expectations and hopes. Emotions of citizens, civil servants, and their political leadership are still raw with shock, terror, and grief. It is a time when governments are seeking policies for fast but inclusive growth. All efforts are directed towards rebuilding infrastructure and housing, energizing

industries, providing jobs, improving health and education, etc. It is the time when the state and its stakeholders seek strategies that will increase investor confidence and showcase government leadership. The state and its agencies seek policies that may move the community forward and towards economic growth and development, despite the monetary and economic uncertainties that are exhibited during times of community reconstruction. Thus, postdisaster public procurement policies and activities need to focus on the laws, the policies, and practices that integrate economic, social, and environmental risks into public procurement processes and decisions.

### Challenges in Postdisaster Procurement

Postdisaster procurement management comes with some challenges. The first one being the potential widespread localized disruptions such that there may be extensive infrastructural damage, inventory constraint, and deficient human resource capacity to execute any contract even if awarded. Infrastructure refers to the network of structures, utilities, and facilities that supply and support our basic needs for mobility, power, water, sewer, communications, and economic activities. Disaster can cause years of infrastructural development to come to a halt, or to go waste, and possibly increase the potentially existing poverty as well as risk vulnerability in a community.

The second challenge concerns the apparent discrimination against local contractors. Providing local contractors the opportunity does not only encourage the postdisaster recovery/reconstruction effort, but it also promotes the rehabilitation and resettlement efforts. However, in most cases, contracts are awarded to big foreign companies, which encourages as well as increase capital flight, at the expense of small local businesses which have the potential to rejuvenate the local economy.

The third challenge is in relation with Cohen and Werker's (2008) concept of political economy (i.e., the political effect and bailout effect) of disasters. The political effect occurs where government take advantage of a disaster situation to redistribute power by favoring communities and people who are politically aligned to the regime in power. On the other hand, the bailout effect is the situation where a government may deliberately underinvest in disaster prevention in anticipation of getting bail outs by donors and international community when a disaster occurs. An extreme case of the political economy of disasters may lead to the racket effect where government or its agencies may leverage on disasters to attract and steal humanitarian aids away from the intended purpose. Under this construct, there could be deliberate action by rogue governments not to prepare for any event. Apart from the potential cost escalations that can be associated with procurement, it can also places disaster stricken communities under continuous poverty and under development.

Following from the above challenges, there is need to create agencies that can detect fraud through rigorous procurement auditing in order to assist the state, the donor agencies, and all other stakeholders in detecting and the minimizing the associated tendency for corruption, resource diversion, and misappropriation during and after disasters. Also, proper resource management, transparency, and accountability are required to enhance monitoring, coordination, tracking progress, communicating results to all stakeholders, as well as align resources to meet their urgent needs. Furthermore, there is need to provide appropriate channels for the aggrieved to seek redress to their grievances.

## Summary and Conclusion

The public sector is a very large and diversified enterprise that spends in the neighborhood of 45–65% of its annual budgets on procurement. This amounts to about 13–17% of GDP in high-income earning countries and even more income earning countries. In times of postdisaster reconstruction and rehabilitation, the figures usually go up. Sustainable Public procurement framework could be a powerful policy tool to demonstrate government's commitment to nation building and sustainable equitable development as a whole. Note that disasters can impact greatly on the

three pillars of sustainability (i.e., economic, social, and environmental). Irrespective of the type or cause of disaster, the consequences affect lives (deaths, displacement of settlements, injuries, and public panic), reduce food security (i.e., shortage of food and water), rupture the socio-economic conditions (e.g., infrastructural damages), and cause economic damage (e.g., losses in sectors like fisheries, agriculture, livestock, tourism, or microenterprises).

After a large-scale disaster and its accompanying widespread destructions and disruptions (such as the Japan earthquake in 2011, or Katrina in 2005, or the Malawian floods in 2019), managing the inflow of resources and spending those resources well have proven to be very difficult. Procurement framework agreements (i.e., a set out terms and conditions with suppliers for making specific purchases) and their effective use can be invaluable tools which signal to stakeholder and the business world that long-term demand opportunities can be available to take advantage of. Through framework agreements, stockpiles can be created and regularly replenished, sometimes in the manner of a reverse auction. Since there may be no market for competition under emergency situations, the site of stockpiles becomes the source of first movement of supplies to where they are most needed. The framework agreements then become the authorized means that procurement can be done in emergency situations without fear of major procurement infractions. Such frameworks can trim the procurement process, widen the supplier base, pre-vet suppliers, ensure that suppliers are aware of requirements, mitigate against risks of low quality products and product substitution, extortionists price, logistical challenges, as well as prepare for repeat orders. With a proper framework available, it will be less difficult to manage the sustainability of the stockpiles, their shipment to disaster sites, the regionalization of markets, the roadmap to ensure that local business and individuals can also win contracts from the rebuilding process are laid down prior to event occurrence. Framework agreements are not used as avenues to centralize procurement, rather, they are a centralized instruments that allow local flexibility with central control. In the Caribbean and other disaster prone areas, for instance, such frameworks have worked to produce results in disaster management.

Finally, impediments/hindrances to disaster preparedness such as the hierarchical structure (as in Giddens' 1979 stratification model) and bureaucratic policies can be two key obstacles. Note that policies and logical decisions do not work well during crises situations. Structure and form of command may cease to exist under real emergency conditions. Generally, disaster caused disruptions generate chaotic states within the affected region. The priority of victims might be the need for survival. In such instances, only preparedness thrives and therefore is a key requirement for the management of any kind of disaster.

## Synonyms

Famine; Deprivation; Hardship; Penury; Starvation

## Definition

Poverty is the condition of lacking in essential needs required for standard living.

Hunger is the state of being malnourished and in need of food.

## Introduction

Nigeria is a country blessed with abundant human and natural resources. Concerning human resources, Nigeria is the most populous Black Country in the world with an estimated population of 200 million people in 2019, growing at a steady 3% rate. Thus, Nigeria is the most populous country in Africa and the seventh most populous country in the world. The Nigerian population has been described as having a youth bulge and boasts of one of the largest youth populations in the world. Concerning natural resources, Nigeria is blessed with abundant resources including crude oil, iron ore, lead, coal, limestone, and arable land.

Of these natural resources, crude oil has received more attention from the Nigerian government and continuously dominates her political economy. Nigeria, the largest oil exporter and home to the largest natural gas reserves in Africa, depends majorly on the sales of crude oil, which accounts for 90% of her foreign exchange earnings and 80% of government revenue. In addition to this, Nigeria's economy is the largest in sub-Saharan Africa and 30th in the world, by gross domestic product (GDP) – to which agriculture contributes 40%. Nigeria also produces a large volume of yam, cowpea, rice, and cassava.

Even though the country has recorded significant economic growth, these have not impacted positively on economic development. Nigeria is plagued with socioeconomic issues such as widespread corruption, pervasive unemployment, and cybercrime among youths. One prominent factor responsible for this is poverty. To be specific, a puzzling proportion of the Nigerian population lives in extreme poverty. Having recently overtaken India to be the poverty capital of the world, Nigeria has the highest number of poor people on the African continent. As reported by the Nigeria Bureau of Statistics (2019), 82.9 million (i.e., 40.1%) Nigerians live in severe poverty as of 2019, and 4 of every 10 Nigerians live on below $360 annually.

The implications of poverty in Nigeria have been extensive with effects on cybercrime proliferation, unemployment, malnutrition, and hunger. The level of hunger and malnutrition in Nigeria, especially in rural areas, is a source of concern. This is evidenced in the 2020 Global Index Hunger wherein Nigeria scored 29.2, indicating a serious level of hunger. Also, malnutrition is responsible for 45% of all the deaths of children below 5 years. About 32% of children under 5 years are stunted, while an estimated two million children suffer from severe acute malnutrition, which is presently the highest in Africa. This is a case of suffering amid plenty, a paradox of poverty amid opulence that requires adequate attention.

## Poverty in Nigeria: Meaning, Causes, and Effects

Centuries after Seebohm Rowntree undertook the first quasi-empirical study of poverty in 1899, the incidence of poverty remains evident in the world and rapidly endemic in Nigeria. This underscores the need to understand the phenomenon. The conceptualization of poverty suffers from a lack of

academic consensus with series of meanings given to the concept. Spicker (2007) identified 12 clusters of the meaning of the word poverty:

(a) Poverty as a material concept: Poverty is a result of lack of necessities.
(b) Poverty as deprivation: Poverty is the suffering resulting from a sustained web of deprivations.
(c) Poverty as limited resources: Poverty is a result of need occasioned by limited command over resources.
(d) Poverty as the standard of living: Poverty is visible when the living standard, income, and consumption of an individual are below a defined average.
(e) Poverty as inequality: Poverty is a result of disadvantaged economic comparison and the resulting distance.
(f) Poverty as an economic position: Poverty describes a particular level of social stratification.
(g) Poverty as a social class: The poor refer to a particular class in the society – the underclass.
(h) Poverty as dependency: Poverty is evidenced by dependence on the receipt of social assistance.
(i) Poverty as lack of security: Poverty is the lack of factors that guarantee fundamental human rights.
(j) Poverty as lack of entitlement: Poverty describes the lack of necessary entitlements, i.e., housing.
(k) Poverty as exclusion: Poverty is when people are excluded from participating in the standard form of social life.
(l) Poverty as a moral judgment: Poverty connotes a morally unacceptable material condition.

From the foregoing, it can be posited that poverty is a state of lack and need for necessities of life needed to participate in society. This is true in the case of Nigeria where a majority of the people – mostly in rural areas – suffer from a lack of one or more of housing, education, a health-care system, good sanitation, electricity, assets, potable water, and good nutrition. The clusters identified above describe the manifestation of poverty in Nigeria – as a multidimensional phenomenon – which incorporates not just income but health, education, living standards, employment, and other important domains of life.

## Causes of Poverty in Nigeria

Poverty in Nigeria is attributable to several factors which include:

***Poor economic growth performance and external shocks:*** Being a mono-product and petrodollar economy, the Nigerian economy is volatile and highly susceptible to external shocks. Since the sales of crude oil accounts for the larger percentage of her foreign exchange earnings, a decline in oil demand will lead to a decline in earnings and, of course, a stunted or recessive economy. As the recent coronavirus pandemic has proven, the fluctuation in oil price is enough to send the economy of the country into recession because there is a non-negligible connection between the international crude oil market and budgetary operations in Nigeria. This unprecedented oil price plummets, and its attendant recession plays a major role in increasing the number of poor people in Nigeria.

***Unemployment:*** The level of unemployment in Nigeria is alarming and is estimated by the Nigerian Bureau of Statistics (2019) to be 23.1%, 55.4% of which is unemployment among the youth. This has been further worsened by the coronavirus pandemic which led to the loss of jobs of many Nigerians. Akinyetun et al. (2020) note that during Covid-19, there was an increase in the rate of youth unemployment in Nigeria due to the shocks of labor demand and labor supply. A lot of people were further driven into poverty as they became subjected to exceptional lack which was deepened by the absence of social welfare packages needed to mitigate the effect of the lockdown and disruption of economic activities occasioned by the pandemic. To be sure, the relationship between unemployment and poverty in Nigeria is causational as one leads to and strengthens the other.

***Policy failure:*** Some of the policies initiated by the Federal Government of Nigeria are inimical to growth and entrench poverty because the majority of these policies are bedeviled by inconsistency, lack of funding, inadequate coordination, unprofessional monitoring, politicization, and high levels of bribery and corruption. Rather than being pro-poor, these policies have ended up engraining poverty. A case in point is the policy of the government to provide financial assistance of N3.5 trillion (i.e., $8.7 billion) to small-scale businesses hit by the Covid-19 pandemic as well as a conditional cash transfer to individuals. As expected, this policy suffered from a lack of proper planning, execution, and unnecessary secrecy. The funds could not be accounted for as the majority of the individuals and business owners lamented not receiving the funds. Therefore, rather than abate, the incidence of poverty further persists.

***Lack of human capital development:*** The individuals who are the units representing their economy have been ignored for far too long in Nigeria. Investments in humans have been dismal, thereby reducing their capabilities and functioning. The lack of investment in human capital in Nigeria has intensified the incidence of poverty as young people have been left to fend for themselves. This has been given as one of the factors responsible for increased cybercrime in Nigeria. Nigeria presently ranks 158 out of 188 countries on the human development index, with a poor record of per capita income, life expectancy, and poverty.

***Corruption:*** Nigeria's performance on the corruption index remains low as corruption continues to permeate almost every sector in the country. The implications of corruption on poverty are extensive. Due to corruption, the funds meant for welfare development, poverty alleviation, service delivery, wealth creation, infrastructural development, employment creation, and quality public service have been diverted by public officials (sometimes in connivance with the private sector) for personal use. There is wanton bribery, kickback, laundering, under-declaration of profit, and nonperformance in government parastatals. The anti-corruption agencies have also been complicit in this web of deceit, thereby reducing public confidence in them. This level of corruption has made meaningful development a mirage and poverty a reality. This trend also made the judicious use of public funds to provide palliatives during Covid-19 unattainable, the effect of which is deepened poverty.

***Insecurity:*** Crime, violence, violent extremism, terrorism, and insurgency are other factors that have increased the incidence of poverty in Nigeria. The Northern part of Nigeria has the highest population density compared to the South. Meanwhile, the majority of Nigeria's poor people are found in these Northern parts where an insurgent group, Boko Haram, has claimed the lives of thousands of people and displaced over two million people. The insurgency has also made economic activities in some parts of the region impossible, while a lot of children are out of school. This has further increased the chances and manifestation of poverty in the country.

## Effects of Poverty in Nigeria

Having examined the causes of poverty in Nigeria, it is equally imperative to identify the effects of the social malady, and they are:

***Recurring poverty:*** When not addressed, poverty becomes endemic and, in most cases, generational. The poverty level in Nigeria continues to rise due to the failure of the past governments to take decisive actions to reduce it. If not combated now, poverty will remain a recurring phenomenon in Nigerian socioeconomic and political discourse.

***Crime:*** There is a connection between poverty and (cyber) crime in Nigeria. As a result of perceived deprivation, frustration and aggression often become the norm among the youth. When this is not managed, it often leads to crime, violence, or youths' susceptibility to radicalization and extremism.

***Disease and illness:*** Poverty subjects people to a myriad of health challenges, diseases, and illnesses. Chronic childhood diseases, mental health problem, substance abuse, infant mortality, earlier

adulthood mortality, ear and eye impairment, and vulnerability to fever are common among poor people in Nigeria, especially in rural areas and Northern parts of the country. The inability of poor people to access basic amenities and deficiency of essential vitamins and minerals subject them to multidimensional disease, illness, and disorder.

***Hunger and malnutrition:*** This is perhaps the most evident effect of poverty in Nigeria. It is easy to identify a child who is hunger-stricken or malnourished. Hunger is the manifestation of extreme poverty whereby a household cannot afford nutritious foods. Indeed, where poverty persists, hunger is evident. This is why the next section turns to appraise the incidence of hunger in Nigeria.

## Hunger in Nigeria: Meaning, Causes, and Effects

Hunger has previously been used by writers to describe a situation of physical pain or weakness from not eating and food-related socioeconomic deprivation. Holben (2005) however identified and grouped the definitions of poverty into four clusters:

(a) Hunger as a drive: Hunger refers to a motivational need or desire for food.
(b) Hunger as an uneasy sensation: Hunger is the resultant feeling of not eating for some time.
(c) Hunger as weakness: The lack of food causes discomfort, pain, weakness, and illness.
(d) Hunger as lack of food: Hunger refers to the prolonged and/or involuntary lack of food itself.

Given this classification, hunger can be described as a feeling of pain and discomfort arising from the lack of food. Hunger is measured using four component indicators: undernourishment, child wasting, child stunting, and child mortality. A cursory look at the situation in Nigeria reveals that there has been a steady rise in hunger statistics in Nigeria since 2008. The states in Northern Nigeria are majorly plagued by stunting and wasting – low height for age and low weight for height. Malnutrition in Nigeria is responsible for increased risk of death, poor performance in school, diminished cognitive development, and low productivity in adulthood. According to Okolo (2006), many Nigerians lack good nutrition. The average daily intake is 9 g of protein contrary to the recommended 65-g intake. This explains the high level of illness, suffering, and death experienced in the country.

## Causes of Hunger in Nigeria

The major causes of hunger in Nigeria are:

***Insurgency:*** Nigeria is a food-deficient country with a poor record of food security occasioned by lack of commitment and high levels of insecurity that have plagued the North. For emphasis, the North accounts for 79.1% of the total cultivable land in Nigeria, thus contributing the largest share of food production. The North also has the highest number of farmers in the country and a favorable ecological condition for crops (such as tomato, yam, onion, wheat, potato, millet, cowpea, sorghum, etc.), which makes production all year round. As such, it can be said that the North is more food secure than the South and can aptly be referred to as the food basket of the country (Okolo 2006). Despite the potentials for food production in the North, the region is the worst hit by the number of hungry children in the country. This is attributable in part to the insurgency that has ravaged the region. Since the outset of insurgency in Northeastern Nigeria, food insecurity has increased, while displacement has been pervasive. Boko Haram has been responsible for the death of thousands of people including farmers. Due to this, many people have abandoned their homes to neighboring communities, thus straining the available resources in the host community. Farmers have deserted their farms as a result of the fear of being attacked. For instance, in December 2020, the international media reported the gruesome killing (beheading) of 76 farmers by the Boko Haram sect. The insurgency has contributed to food insecurity, malnutrition, and hunger in Nigeria.

***Poverty:*** Behind the problem of hunger lies poverty. Poor people generally find it difficult to

maintain a standard way of life or experience favorable well-being.

***Coronavirus pandemic:*** Covid-19 also increased the spate of hunger in Nigeria due to restricted movements, restricted economic activities, and unemployment. During the lockdown, farmers could not go to the farm leading to a decrease in farm produce. The little goods available were hoarded, while in some cases the prices skyrocketed. This meant that the poor were systematically denied access to food and therefore subjected to hunger.

***Food insecurity:*** The ability to access enough food and resources required to acquire and produce food leads to inadequate diet and poor health. This impairs the ability to live a productive healthy life.

The effect of hunger in Nigeria cannot be overstressed. Hunger leads to illness, disease, malnutrition, undernutrition, mental problem, child mortality, food insecurity, and poverty.

## Poverty and Hunger in Nigeria: Way Forward

Eradicating poverty and hunger is at the core of Sustainable Development Goals 1 and 2: to eradicate extreme poverty and end hunger among all people by 2030. Meanwhile, combating poverty and hunger in Nigeria has proven a herculean task. That there is no universally agreed formula to reduce poverty and hunger does not invalidate the need for the Federal Government of Nigeria to make frantic efforts to reduce these social oddities to the minimum.

To tackle poverty and hunger, the Federal Government of Nigeria must pay dire attention to education, human capital development, and social welfare programs; promote agricultural research, employment creation, skills development, deradicalization of Boko Haram, poverty alleviation schemes, and partnership with humanitarian and nongovernmental organizations to address lack of nutrition and hunger, food security, improved service delivery, health initiative, rural welfare, potable water, and improved sanitation; diversify the economy; and tackle corruption.

## Synonyms

Community welfare; Marginalized societies; Poverty relief; Wellbeing

## Definitions

Poverty reduction involves a set of actions, both economic and humanitarian, that are intended to permanently lift people out of scarcity. Poverty reduction is often used as a short-hand for promoting economic growth that will permanently lift as many people as possible over a poverty line.

## Introduction

The dawn of the Industrial Revolution led to high economic growth, eliminating mass poverty in what is now considered the developed world. However, presently worldwide, approximately 734 million people live on less than $2.50 a day. Over three billion people are deprived of basics ranging from food, water, shelter, healthcare, and education, among others. This is dominant particularly in the developing societies as compared to the developed world. For example, Africa has more than 800 million people living in 54 different countries and is by far the world's poorest inhabited continent. Around 28% of all children in developing countries are estimated to be underweight or stunted due to poverty in sub-Saharan Africa. About 72 million children of primary school age in developing countries were not in school in 2005 due to insufficient funds (Kwemarira et al. 2019).

The gap between the rich and the poor is at its highest level in Africa. Most of the developing countries as well as development organizations have devoted much of their attention and budgets towards the reduction of poverty in sub-Saharan Africa but to no avail. Despite the existence of Poverty Reduction Strategy Papers (PRSPs), Millennium Development Goals, and the Sustainable Development Goals that succeeded the MDGs in 2015 and the New Partnership for Africa's Development, about 316 million in Africa still live below the US $1 dollar a day poverty line as do 1.2 billion people worldwide. The international poverty line has just been raised to US $ 1.90 a day, but global poverty is unchanged (World Bank 2020). Several researches conceptually and empirically exist on the construct of poverty reduction in Africa. However, these studies have paid less attention to the power of planned behavior theory, personal initiative theory, and social capital and human capital theory combined together in informing poverty reduction particularly in sub-Saharan Africa.

## Theoretical Underpinning

### Theory of Planned Behavior

The theory of planned behavior (Ajzen 1991) attempts to explain all behaviors over which people have the ability to exert self-control. The central theme in the theory of planned behavior is the individual's intention to perform a given behavior. It emphasizes that individuals are rational in considering their actions and that decision is made under uncertainty. Rational decision implies that either optimum results are expected or decision-making unit is aware of all the impacts and consequences. By introducing perceived behavioral control to subjective norms and attitudes, the theory clearly explains the relationship between behavioral intention and actual behavior. In this entry, the construct of attitude towards behavior is identified to explain the intentions that propel people to work hard and finally move out of poverty. For example, the leading cause of poor hygiene as a dimension of poverty in Uganda is the lack of basic necessities like clean water and permanent toilets. This makes Ugandans fail to clean themselves, their children, and their homes as required. Then, a lot of money is spent on medication that would otherwise be spent on improving the wellness of families. Emanating from the theoretical lens of planned behavior, citizens should be changed on basic hygiene, for example, to always wash their hands before eating and after leaving toilets. This assists in saving money that would be taken to hospitals to improve families. However, the theory does not account for other variables that factor into behavioral intention and motivation, such as being self-starting, innovation, setbacks, persistence, and threat that may influence people's intention to perform a behavior or actions that may enhance their wellness. This introduces the personal initiative theory.

### Theory of Personal Initiative

The theory of planned behavior is supplemented or challenged by upcoming phenomena, the theory of personal initiative (Frese et al. 1996). Personal initiative is based on the fundamental idea that human beings are not only influenced by their environment but also influence the very same. It is seen as a behavioral syndrome that results in an individual taking an active and self-starting approach to work goals/tasks and persisting in overcoming barriers/setbacks, and one of the consequences of such an active approach is that the environment is changed by the individual (if ever so slightly). This is in contrast to a passive approach, which is characterized by doing what one is told to do, lacking the ability to adjust easily to misfortune or change (not being **resilient**), and reacting to environmental demands. Showing initiative involves spotting and acting on opportunities by keeping one's minds open to new ideas and new possibilities that other people have not noticed inclusive of fighting poverty. It is noticed here that a person who is innovative and is in control of relevant and important issues at work and business will be paid off by having control.

Also, personal initiative is characterized by its self-starting nature, its proactive approach, and being persistent and resilient in overcoming difficulties/barriers that arise in pursuit of a goal. Frese (2009) further stated that PI behavior is a central feature/construct in poverty reduction; therefore, increasing PI leads to actively pursuing wellbeing tasks which in turn reduces poverty. The initiative has also become increasingly important in today's businesses, and many people want employees who are innovative and can take action without waiting for someone to tell them what to do. After all, this type of flexibility and resilience is what pulls human beings to innovate and to overcome competition. Critiques of this theory have quibbled that the theory fails to acknowledge the fact that people have different levels of stamina and not everybody can endure being self-starting, proactive, persistent, and resilient since that could be stressful and exhausting.

### Social Capital Theory

Social capital theory emphasizes (Coleman 1988) close ties through family, business, community, and religious affiliation that is vital to improving the wellbeing of an individual by assisting in moving out of poverty. This is conceived from the thinking that the provision of mutual trust, knowledge, shared beliefs, cultural values, social networks, information flow, valuable resources, and insurance is necessary to facilitate cooperation to both the individual and the community. Most people connect themselves with networks to gain cooperative action and also obtain relevant information, skills, and other resources that are needed for their businesses. Social capital conceptions of lifelong learning emphasize the creation of learning societies, in which continual learning enhances connections among individuals and engenders civic participation. Rather than being concerned with economic output, social capital concentrates more on civic society and networks in the family and community. The level of engagement that participation in adult education and learning can foster has been found to strengthen the fabric of communities and encourage citizenship, critical awareness, and understanding. However, it has been noted that social capital is not always used for positive ends. An example of its complex effects is violent or criminal gang activity that is encouraged through the strengthening of intragroup relationships (bonding social capital). The theory has been criticized for its inability to address how the absence of education (learning) could decrease connections among individuals and civic participation which could be addressed by Human capital theory.

### Human Capital Theory

Human capital theory has strongly influenced most debates on the relevance of education for development. It is premised on the thinking that there are substantial economic effects of education for social development. The theory presumes that formal education is highly instrumental and even necessary to improve the production capacity of a population. Human capital proponents

assert that an educated population is a productive population because education increases the productivity and efficiency of people by increasing the level of cognitive stock of economically productive human capability. According to Fägerlind and Saha (1989), human capital theorists provide a basic justification for large public expenditure on education both in developing and developed nations. Education creates skills which facilitate higher levels of productivity among those who possess it when compared with those who do not. The strength of this theory lies in the fact that when populace attains education, they attain knowledge and seek for formal employment; others will even employ themselves, thus reducing poverty. The advocates of this theory believe that those with higher levels of education seem to have, on average, higher levels of productivity. Additionally, an effective anti-poverty strategy should incorporate the enhancement of education and skills among poor homes and that such an approach improves productivity in the African rural setting. The theory maintains that education promotes the eligibility for paid employment in the formal sector and for their advancement once the people are employed. Similarly, Bowles, Gintis, and Oxaal (1997) argued that increasing levels of schooling in the labor force are likely to be functional to the process of employment growth. They also suggest that although education is necessary in improving the wellbeing of the poor and thus contributes to poverty reduction, it also has a tendency of perpetuating inequality in society. A number of empiricism suggest a direct relationship between educational attainment, job opportunities, and poverty reduction. Relatedly, higher levels of education do not only contribute to productivity and income earnings but also narrow the income gap across gender and racial lines.

## Poverty Reduction

Recently, research interests have shifted to understanding poverty in its multidimensional form. This interest has been furthered by the increasing availability of relevant data and the inability of the one-dimensional measure to capture multiple deprivations. The multidimensional form draws largely on the basic needs argument and Sen's capability approach (Sen 1984). In a broad sense, poverty can be understood as involving not only a lack of necessities of material wellbeing but also the denial of the opportunities of living a tolerable life within a society (Anand and Sen 1997). A number of people in Africa are not formally employed, and their monthly incomes are not guaranteed. They do not have a stable income which makes the family fail to buy the basics of life ranging from food to even children going to good schools. In order to have good life among the unprivileged, the main asset of the poor is human capital. Human capital development, particularly education and training, are critical ingredients for a country's sustainable socioeconomic development and poverty eradication. A successful poverty eradication strategy would require full and proper development of human capital through equitable education policies. This is especially in line with the fact that poverty is a complex issue that requires to be tackled by using all fronts particularly education. Education is thus a vital tool because its role in poverty reduction cannot be underestimated as no country has successfully eradicated poverty without educating its people.

As one of the most powerful instruments for poverty reduction, education can be a guarantee for development in every society and to every family. Its centrality is not only for poverty reduction, but it can also contribute in reducing inequality. It can equally be argued that education enhances people's productivity. No one would doubt that education gives people some necessary skills that increase their capacity to produce more effectively and efficiently. Education can thus directly reduce poverty through the contribution that productivity enhancement makes to economic growth, and that could indirectly help to alleviate poverty through its positive spillover effects (externalities) on society more broadly.

Many women working in both formal and informal sector have a substantial "decent work deficit." Employment is often described as the most important link between economic growth and poverty reduction. Providing income-earning opportunities through wage employment or self-employment for poor women and men is crucial to raising incomes and overcoming poverty. However, currently women across the developing world enjoy limited access to fair and decent work compared to men largely as a result of lacking skills. Krueger (1983) argued that poverty is assumed to come from the effects on the real wages of unskilled workers, endowed with labor but no human capital. Consider Africans in leadership positions who are able to suggest, implement, and follow up different poverty alleviation beneficial programs ranging from increasing household assets, food security, and improved health status. In the long run, their families and associates stop lacking as these programs improve the welfare of households, thus reducing poverty.

## Conclusion

The entry concludes that when people from developing countries attain quality education, they get employed either formally or informally which leads to poverty reduction. There should be a development of long-term economic and social policies aimed at building societies that encourage and motivate the parents to send their children inclusive girls to school. Education and training underpinned by human capital theory is an important predictor of job creation especially vocational training as youth get vocational skills and they start their own jobs which leads to poverty reduction especially at household level. However, vocational, technical, and skills enhancement matters a lot among people in sub-Saharan Africa in alleviating poverty. Therefore, there should be a shift from the current education being provided to focus on practical skills enhancement among Africans that are vital for job creation that will eliminate poverty. Through the joint lens of personal initiative theory and the theory of planned behavior, the scholars conclude that the creation of employment promotes poverty reduction. Employment increases the incomes of poor families as the best way of fighting scarcity. There should be innovative economic policies to reduce the level of adult unemployment and underemployment that facilitate income generation. When there is employment, people can take their children to school because they can afford the costs of schooling which greatly contributes to wellbeing in societies.

## Synonyms

Ability; Authority; Authorization; Capacity; Consent; Control; Dominance; Delegation; Force; Influence; Permission; Right; Strength

## Definitions (from the Oxford Dictionary)

Power: "The ability to do something or act in a particular way, especially as a faculty or quality" (e.g., *the power of speech*), "The capacity or ability to direct or influence the behavior of others or the course of events" (e.g., *the idea that men should have power over women*), "Political or social authority or control, especially that exercised by a government" (e.g., *a power struggle*), and "A person or organization that is strong or influential within a particular context" (e.g., *he was a power in the university.*).

Empowerment: "Authority or power given to someone to do something" (e.g., *individuals are given empowerment to create their own dwellings*.) and "The process of becoming stronger and more confident, especially in controlling one's life and claiming one's rights" (e.g., *political steps for the empowerment of women*.).

## Introduction

This paper will discuss two interesting and interrelated concepts: power and empowerment. First, this study explains similarities and differences between these concepts. Second, this paper's focus shifts to empowerment: The definition and construction of employee empowerment will be provided. Then, this paper discusses the benefits and costs of power and empowerment. Due to the importance of empowerment, this paper briefly extends the discussion of power and empowerment and offers future research agendas. Finally, a discussion and conclusion are provided.

One of the most interesting concepts within organizational behavior is power. Power refers to the ability to do something or to have authority in an organization, whereas empowerment refers to the distribution of power from the top to employees working at lower levels. Thus, empowerment refers to granting power to middle-level managers and frontline employees, yet all types of employees possess power. In particular, senior level employees and political appointees possess more power.

Two basic assumptions of organization theory are that all individuals, organizational units, and organizations want to survive and flourish (prosper). One important way to survive and flourish is to gain power. In fact, all types of organizational member – regardless of whether they are members of public, private, or nonprofit organization – use or aim to use power to influence others. For instance, employees and managers form coalitions, engage in organizational politics, and negotiate to influence organizational processes and outcomes. Thus, organizational power and politics need to be recognized as they occur in every organization.

Likewise, in order to minimize dependency, individuals form coalitions and try to acquire more power. It is usually the case that the higher the position a person has in an organization, the better their access to resources including information, money, and human, so these people can attain greater power. Nevertheless, power relationships are not always hierarchical. For instance, someone from the lowest level of the organizational hierarchy may have power over the organization and organizational leaders based on her or his technical skills. Finally, frontline employees may be empowered, which implies that they have some power to do something. For instance, if an organization provides empowerment to employees, then these employees may determine some of the processes and outcomes of organizational products and services. In this regard, the relations of power and empowerment

are very dynamic; they can shift depending on organizational structures, organizational policies, the budget and resources of organizations, and the types, sizes, and characteristics of organizational leaders, teams, and employees.

## Similarities and Differences Between Power and Empowerment

"Power" and "empowerment" concepts are one of the most interesting topics of the organizational behavior and management studies. They have very similar meanings, yet these terms also contradict each other. Empowerment includes the word of "power," and both concepts share the same "root" in the English language. Both of these concepts imply power, authority, and influence. However, these terms also differ significantly. These terms imply different contexts, processes, and outcomes.

First, power is as old as history itself. The intellectual roots of power go back to the early ages. Philosophers like Plato and Aristoteles discussed power and how to use power effectively, justly, or coercively. *The Prince*, written by Niccolo Machiavelli in the sixteenth century, is the most significant example of a thorough examination of power. Throughout the book, Machiavelli discusses elements of and types of power; how to gain power, use power, and control power; and how to navigate relationships of dependency. He argued that power is not only desirable but also necessary for leaders. The philosopher Max Weber, however, was suspicion of the use of power.

In contrast, the concept of empowerment goes back to the Human Relations Movement in the 1930s, making it a much newer concept. Employee empowerment programs and policies were not implemented until the 1980s. Since the 1980s, management scholars and governments around the world have discussed the importance of empowerment in public and private organizations. In fact, empowering employees and managers was one of the ideas of the New Public Management (NPM) reforms globally and of the National Performance Review (NPR) in the United States. One problem with the NPM and NPR reform applications is that their focus has been primarily on empowering middle-level managers rather than frontline employees.

Second, the field of organizational behavior consists of five important disciplines: psychology, sociology, social psychology, anthropology, and political science. In other words, these five disciplines contribute to the field of organizational behavior. Power is primarily studied by the disciplines of political science and anthropology, while empowerment is primarily explored in psychology, social psychology, and sociology. In fact, empowerment is one of the hot topics of management and business studies.

Third, while power refers to an accumulation of power at the top of an organization, empowerment implies reducing some powers at the top and distributing some of this power to employees. In this regard, power and empowerment can be seen as opponents in a zero-sum game: The higher the power of an individual at the top (e.g., the President and CEO), the lower the power of the individuals below (e.g., middle-level managers or frontline employees). The more empowered the workplace, the less power is held by top managers. In some cases, even within an organizational structure of centralized power relationships, some managers may not have been able to exercise their power (e.g., the manager may lack referent power like charisma). On the other hand, a skillful employee may hold more power than the managers. Thus, empowerment refers to sharing or distributing power.

Fourth, the bureaucratic structure focuses on power, status, and extrinsic rewards (Thompson 1965). Less bureaucratic organizations, on the other hand, focus on empowerment rather than power, outcome rather than status, and intrinsic rewards rather than extrinsic rewards. Therefore, power structures are indicative of the type of organization as well as organizational structure and design. For instance, while traditional government structures imply hierarchy, chains of command, and powerful elected officials or agency leaders, a network-type of organization focuses less on hierarchy and more on shared empowerment. In this regard, more bureaucratic

organizations focus on power, while less bureaucratic organizations focus on empowerment.

Fifth, the idea of empowerment started in the 1930s and 1940s in opposition to the scientific management movement. The scientific management movement in the early twentieth century focused on efficiency, mechanization, top-down management, and labor productivity, so the movement discouraged the empowerment of consulting employees. Empowerment in the workforce, on the other hand, implies democratization, humanization, and employee participation in the workplace. As a result, despite the similarity of these terms, these two terms have different implications.

## Defining and Constructing Employee Empowerment

Employee empowerment has received significant attention within both scholarly research and popular literature since the 1980s, but disagreement abounds over how to best define, conceptualize, and measure it. At least one broad cleavage exists: empowerment as a relational/management construct and empowerment as a psychological/motivational construct. First, employee empowerment as a relational/management construct consists of a set of practices that managers can employ. For instance, according to Bowen and Lawler (1992, p. 32), empowerment practices include: "(1) information about the organization's performance, (2) rewards based on the organization's performance, (3) knowledge that enables employees to understand and contribute to organizational performance, and (4) power to make decisions that influence organizational direction and performance."

Second, employee empowerment as a psychological or motivational construct contends that empowerment is a cognitive state in which a person or an employee feels enhanced feelings of self-efficacy, self-determination (e.g., autonomy and competence), and task motivation. More specifically, in his seminal work, Spreitzer (1995) defines psychological employment as "a motivation construct" and elaborates the construct as consisting of four interrelated dimensions: meaning, self-determination, competence, and impact, which together create an active orientation to take actions that shape the work role or environment.

Both constructs and definition include elements of power. For instance, regarding the latter approach, employees' beliefs about their autonomy and competence indicate that they have power – powers of controlling, learning, achieving tasks, and shaping the environment. While the second approach implies power, the first approach, on the other hand, clearly states power: Employees need power so that they can make decisions that influence organizational outcomes such as organizational performance. To empower employees, organizations can provide resources to employees and train them. They can allocate rewards to higher achievers. They can share information about performance. However, without power, employees or middle-level managers cannot achieve organizational outcomes. Thus, power is the most important facet of employee empowerment.

## Benefits and Costs of Power and Empowerment

The benefits and costs of power and empowerment have different implications. Employee empowerment has become a recent trend over the last few decades. The benefits of power and empowerment are that they allow organizational members to exercise authority and make decisions. As mentioned in the previous section, power is a crucial part of empowerment. If employees are not provided with enough power, they are not able to implement policies, allocate resources, coordinate employees, and execute decisions. Pfeffer (1992, p. 338) states that "In corporations, public agencies, universities, and government, the problem is how to get things done, how to move forward, how to solve the many problems facing organizations of all sizes and types." Pfeffer (1992) states that power is necessary for managing organizations. Organizational members need power; they need to understand power dynamics and strategies that develop

power. Additionally, empowerment allows organizational members to join in the decision-making process, so empowerment is consistent with democracy and humanization in the workplace.

The negative aspects of empowerment may be the following: First, although empowerment may work well for service organizations, it may not work as well for product types of organizations. While the former focuses on "service" and customer and employee satisfaction, the latter focuses on efficient and timely production. Because empowerment may take time and be costly, empowerment may not work as well within the latter type of organization. Second, public organizations typically have a bureaucratic culture. Because bureaucratic culture emphasizes rules and regulations, empowerment might disrupt the hierarchical chain of command, increasing conflicts in the organization. Third, giving power to employees without controls or a system of checks and balances may cause an excessive use of power, conflicting with the goal of democracy. As a result, too much empowerment may cause indecision, delays of processes and outcomes, inefficiency, and the accumulation of power by a few influential individuals.

In this regard, the use of power and empowerment is an art, science, and craft. If employees are not given any power or incentives, empowerment cannot be achieved in organizations. Employees not only need support but also power to take action and make decisions. On the other hand, excessive empowerment and power have potential problems. Thus, it is necessary to achieve balance while keeping in mind the contingencies of the organization: How and what level of power and empowerment should be granted to employees depends on time, type of organization, the characteristics of organizational stakeholders, leadership and employee quality, the level of red tape, and the external environment. Political and organizational leaders should find the right balance considering all these factors. Empowerment should not undermine or eliminate the bureaucratic or democratic process.

It is likely that the best way to approach empowerment is to create a climate and culture of empowerment and then to institutionalize empowerment and its process. To create a climate and culture of empowerment, first, common goals and perspectives are needed among organizational members. Pfeffer states,

> If people share a common set of goals, a common perspective on what to do and how to accomplish it, and a common vocabulary that allows them to coordinate their behavior, then command and hierarchical authority are of much less importance. People will be able to work cooperatively without waiting for orders from the upper levels of the company. Managing through a shared vision and with a strong organizational culture has been a very popular prescription for organizations. (Pfeffer 1992, p. 25)

## Extensions of Power and Empowerment and Future Research Agenda

One interesting concept is the importance of the sources of power and empowerment. The sources of power can be formal (e.g., a legitimate power like formal authority in organizations, coercive power, and reward power) or informal (e.g., expert power, like that of an employee who has extensive skills and knowledge of technology). When a manager or an employee has formal or informal power, she or he can be considered powerful. On the other hand, empowerment is generally given by organizations or organizational managers to middle-level managers or frontline employees. Thus, while empowerment is given, power can be either taken (e.g., expert power) or given.

Another important question is how employees and managers use power or empowerment to influence other organizational members. The answer may be simple, but its implications are complex. One implication is that organizational members can use tactics to influence others. There are several tactics for achieving power and empowerment. For instance, a manager or an employee can make logical claims and provide evidence to gain something, a tactic called rational persuasion. Or, she can consult and ask managers for additional power or distributing power. Or, she can give something to a manager and ask for a favor in return to gain power. For example, an employee who is skilled with computer software

programs can help the organization, and her supervisor may promote her. There are many tactics that organizational members can use more or less successfully to gain power and empowerment. Although research exists on power bases and sources of power, no research is available regarding the bases and sources of empowerment. Thus, future research may focus on the latter.

How can power and empowerment be applied usefully to other concepts? Or, how can researchers use power and empowerment to explain other phenomena? This and the following paragraphs will briefly discuss how empowerment can be used as a dependent, independent, moderator, and mediator variable. First, researchers can treat power or empowerment as the dependent variable. The use of power increases where resources are limited, where disagreements occur on goals, and where there is a high level of interdependence and decentralization and a climate of uncertainty about knowledge and equipment (Pfeffer 1981, 1992). However, the factors effecting empowerment are not well known. For instance, how do organizational structures and type of organization affect the adoption of empowerment practices? How does the climate of innovation affect empowerment? Future research can continue to analyze these factors.

Second, researchers can treat power and empowerment as independent variables. For instance, an interesting question would be: What are the outcomes of empowerment and power? How do empowerment and power influence individual, group, or organizational performance? It would be interesting to analyze how empowerment as an overall practice or facets can affect employees' job satisfaction, performance, innovativeness, creativity, organizational commitment, job involvement, decision-making, turnover, affective commitment, and barriers to innovation. Although some studies exist on these topics, more studies are needed for comparison and to build knowledge of the effects of empowerment.

Third, power and empowerment can function as mediators, or moderators, as the connection between organizational structures and organizational outcomes can be mediated by power, or empowerment can mediate the relationship between perceived accountability and innovative behavior. Although studies exist considering empowerment as a mediator or moderator, using power as a mediator or moderator is not common. Finally, future researchers could also analyze the relationship of power and empowerment to accountability and the relationship of power and accountability to networks and collaborative governance. As a result, power and empowerment and the relationships among these concepts and employee attitudes seem very promising topics for future research.

## Discussion

Understanding power and empowerment processes in organizations can contribute to the success of groups and organizations. Rather than power, powerlessness is the problem. While power is crucial for leadership, empowerment is crucial for organizational success. Although empowerment is not an essential part of management, it can increase employees' job satisfaction, motivation, and commitment, and it can reduce barriers to innovation and turnover in the workplace as well as improving organizational performance. Thus, power and empowerment are neither tasks nor ends; rather, they are processes or essential means to achieving organizational and individual ends.

All types of organizations include people who use power in order to influence other people, organizational outcomes, and organizational decisions. "People who acquire and use power appropriately and well are persuasive, have a positive influence on others, and are better able to obtain necessary support and resources for programs, people, and priorities" (Denhardt et al. 2012, p. 238). Likewise, "Innovation and change in almost any arena require the skill to develop power, and the willingness to employ it to get things accomplished" (Pfeffer 1992, p. 345). As a result, the important question is not whether power exists or whether leaders should use power. The important questions are how power is being used to help achieve organizational goals and whether these uses of power are ethical. In

fact, public value and ethics should be top priorities in the public sector. In this regard, power should not be the goal or the end in itself. Instead, power can be a means to achieve organizational outcomes such as better organizational performance. At the same time, ethical public service should be a priority. The use of power and empowerment should always be consistent with ethical standards. Otherwise, history has taught us that power corrupts. Finally, in terms of applications in a democratic context, in addition to empowering employees, citizens need to be empowered. Specifically, from a relational perspective, citizens need to be empowered and given information about how the government is doing.

## Conclusion

This paper has discussed the concepts, constructs, benefits, costs, and research agenda of power and empowerment. At least two constructs of empowerment exist in the literature: psychological/motivational and relational/management. As a management approach, empowerment aims to share information, rewards, resources, and power with middle- and low-level employees. Power is a crucial part of empowerment. While the study of power is as "old" as history itself, empowerment is the "new" object of study of the newly established subdiscipline of organizational behavior. While power is primarily associated with political or organizational leaders, empowerment is associated with frontline employees and middle-level managers. The former implies accumulating power at the top of the hierarchy, whereas the latter implies distributing power from the top to the bottom of the organization. These terms possess both similarities and differences in terms of application and implications.

Organizational potency and conscience; Prepollence and fairness; Puissance and integrity

Power is the ability to get things done. Ideally this occurs through the constructive application of creativity and cooperation. The sources or bases of power in organizations, as delineated by French and Raven, can be described as legitimacy, expertise, referent power, coercive power, and reward power. Legitimate or positional power is held by people who "earned" the position and are, therefore, the legitimate heads of an organizations, managers of agencies, or professors. Expertise can make one seem to be indispensable to an organization because "experts" solve problems and, hence, become influential and are often highly promotable. Referent power derives from either the cultivation of interpersonal relationships usually based on charisma within an organization or by the perception of association with

the organizations top management. Coercive power rests on the policing ability to fire, reprimand, punish, threaten, or sanction others. Reward power is a two-edged sword. The power to allocate resources, or reward power, includes the provision of salary increments, positive appraisals, and promotions. If used well, it is a great motivating tool. But, if there is favoritism or the perception of favoritism, reward power greatly demoralizes employees and diminishes their output.

Morgan argues that "power" in organizations is available to all who have the ability to cultivate it. His categories are formal authority; control of scarce resources; use of organizational structure, rules, and regulations; control of decision processes; control of knowledge and information; control of boundaries; ability to cope with uncertainty; control of technology; interpersonal alliances, networks, and control of the "informal organization"; control of counter organizations; symbolism and the management of meaning; gender and management of gender relations; structural factors that define the stage of action; and self-cultivation or "the power one already has."

Formal authority rests on the basic employment transaction and belief that people who are paid to do a job must do whatever the payee demands. Control of resources, especially if they are diminishing, can lead to internal turmoil and can embellish existing centers of power. Organizations use structures, rules, and regulations as administered by power brokers or managers through a variety of structures including departments and teams. From Morgan's perspective, the people who do know the rules and regulations in detail can become sources of power within the organization. Power can also aggregate around those who overstate rules or understate their meaning. Is this an abuse of power? Who controls the process of making decision in an organization and how are decisions made can be power central in an organization. Work can be selected and resources can be allocated by the decisions decided by individuals or groups of people. The management of this process, requiring, for example, consensus or managerial sign-off may embellish the power of some while it limits the power of others to make decisions. Those who chair meetings or are in charge of keeping the minutes may have notable powers to control decision-making processes and the decision themselves.

Is knowledge power or does power reside in the gathering of facts and their dissemination? The power of experts as holders of highly specialized knowledge is eroding as information technologies democratize or displace such power aggregators. Instructions for writing wills, for example, are available online for every state in the union. Enterprising individuals can write their own will and not hire an attorney to do so.

Boundary control, another form of power, can take multiple forms. This may be the job of appointment secretaries and security guards who decide, each in separate spheres, who may enter and under what circumstances. Morgan suggests that personal resilience or the ability to cope with uncertainty allows individuals in organizations to tackle assignments others avoid or fear because they are, in some way, harmful. Taking on what others fear, dread, or avoid may be a route to promotion and add to one's power within the organization.

Making sophisticated information technologies cheap enough to be widely available has created new organizational power centers. Morgan points out that former Information Technology managers are now "CIOs" or Chief Information Officers who control access to the latest, fastest computers and the new software. Sometimes having the latest technology can be a status symbol adding to the holder's "social power" and reputation.

Power can inferred through the development of interpersonal alliances and networks in control of "informal organization." People will usually help their friends and those who have helped us in the past. Those who build social networks in organizations by bringing associates together informally can gain a significant amount of power. But informal and formal organizations can sometimes become counter-organizations. In public organizations, like institutions of higher education for example, faculty counter-organizations have formed to fight the corporatization of universities which robs the professoriate of their responsibilities for shared governance.

Management of symbols and their meaning is a powerful tool for change and influence in organizations. In most organizations there are power struggles between the genders. Women are still, in the aggregate, losing. But demographics favor women who are filling the pipelines to power at the lower levels in such numbers that the possibility of major breakthrough in the upper echelons of power appear to be on the horizon. Those who shape the purpose, vision, mission, and strategies of organizations exhibit the power for societal leadership that moves organizations into the future. Without this organizations would wither in the face of societal change.

However, the term "power" is freighted, for good reason, with a host of negative consequences. Entire dramas going back to the ancient Greeks, revolve around example after example of the abuse of power. Aeschylus's Agamemnon suffered from arrogance and thoughtlessness. Sophocles's Oedipus Rex committed patricide causing his wife and mother to abandon him. And, Euripides's Medea deserted the family and committed homicide. Unfortunately, the dramas have, more often than not, fallen short of actual events which are so instilled as to become iconic. Examples range from the Teapot Dome Scandal's no bid contracts and the political espionage and illegal surveillance of Watergate to the NSA's warrantless surveillance programs. This is just in the public sector. A true accounting of the abuse of power in the for-profit and nonprofit world speak volumes. Most immediately, the fraud that lead to the bankruptcy of Enron in 2001 and WorldCom in 2002 were matched in 2015 when it was found that Volkswagen deliberately engineered misleading vehicle emission calibrations and the FBI indicted world soccer's FIFA officials for racketeering, fraud, and other offenses. The same year Toshiba overstated its earnings by $7 billion, more than four times the actual earnings, over a 2 year period. The price gouging drug company, Valent, created a specialty pharmacy company, Philidor, to artificially inflate sales. Meanwhile, Turing jacked up the price of a drug that treated HIV patients by 5000% from $13.50 to $750 per pill. In 2016, Mylan began selling emergency allergy life saving EpiPens for $600 for two, up from $58 per pen in 2007. The nonprofit sector has also experienced its share of plundering and filching. The United Way case rocked the 1990s when president William Aramony was convicted of stealing $600,000. Risking reputations all too many nonprofits continue to be undermined by CEO malfeasance and/or board neglect.

Three sectors, public, nonprofit, and for-profit, are suffused with examples of the abuse of power. It is not surprising that citizens are skeptical and have been for centuries. For example, the founders, according to Frederickson, crafted the constitution of the United States, to ensure the absence of tyranny, viscerally still considered a negative in the popular imagination, with a system of shared power and checks and balances. Abuse of power is a problem for all organizations. Although examples of malediction are rife in all sectors, public institutions are particularly reviled if evidence of debauchment or the perception of wrong doing exists, whether or not it is linked to performance. This may be because public institutions reflect cherished values key to the broader societal image that both fires and fuses citizen identity. Citizens may not be surprised, but they may also feel emotionally blighted and find relief in cynicism, not voting, and undue resentment over taxation, etc. Political instability may ensure.

Having said that, the display of power as discretionary authority by public officials is generally accepted, even if potentially controversial because power, used correctly, serves the common good. The bridge between the abuse of power and right conduct is ethics. By all accounts, ethics reside, first, in the person but not entirely because individuals can be resocialized by organizations embracing ethical policies, practices, and procedures. Individuals, however, comprise the human capital of public organizations and their ethical norms and those of society as a whole impact the organization. Each person is a composite of beliefs and perceptions about right and wrong that may originate intuitively as does natural law, or come from religious imprecations, or what may have been learned from the study of philosophy. The individuals ethical persona can be foundational and either align or conflict with the organization's values.

Whether or not organizations abide by or disregard ethical injunctions depends on the expectation of the broader society. Ethical organizations enhance the legitimacy of power structures and create trust that operates as glue between an organization or government and the citizenry.

To paraphrase Koven, good societies, good governments, good organizations, and good individuals are founded on ethical considerations. Ethical institutions are foundational and framing. Ethics outline the means to achieve socially derived ends. They are the boundaries, precursors, preconditions, and preliminary frameworks undergirding the exercise of behavior and the values activated when designing and implementing public policy.

Although nonprofits are fighting it, there have been calls for the US Congress to pass a Sarbanes-Oxley like regulatory act for nonprofits. The 2003 United Nations Convention Against Corruption calls for the institution of codes for the public and private sectors. The UN calls for preventive measures and safeguards to the abuse of power that promote efficiency, transparency, and accountability. Developing codes of conduct with requirements for financial and other disclosures backed up with disciplinary means could raise the standards of conduct in the public services.

Ethical codes are institutional and symbolic. Within the organization they articulate boundaries of behavior and the expectations. Markers should define what is prohibitory and how to behave such as showing impartiality to all citizens. As symbols, ethical codes reflect how public institutions see themselves and how they want to be seen by others. Public servants in democracies have a special professional standing in their communities and responsibilities flow from that. Ethical codes require understanding by deploying cognitive or reasoning abilities and the ability to appeal to the emotions of guilt, shame, conscience, and pride in profession.

Ethical public managers direct power for the benefit of the common good even though the specific missions of agencies are various. It is up to mangers to work any ethical ambiguities into specific directives, prescriptions, and proscriptions of behavior within the boundaries of the organization's mission. In the public, specific responsibilities and mandates guide an organization's goals. Cultures and formal and informal behaviors develop to support the mission and shape the way standard operating procedures are carried out. Ethics are consciously inserted into all processes and procedures and become part of program review, assessment, and evaluation. Actions that enhance public support generally foster the mission as they flow from the organizational culture and reaffirm public perceptions of behavior. Such action either bolsters public support and therefore the legitimacy of the organization and, in the public sector, the government. Or, the action may erode public support.

Power used ambiguously by public organizations may create difficulty for the citizenry. Problems in the modern world do not come in either/or, black/white, yin/yang polarities. Ethical codes fall short of dealing with the problems of "dirty hands" or doing bad to achieve good results. Ethical codes in the future need to ask, what George Frederickson has asked of public administrative professionals to do: who benefits and why? That is the ultimate power question.

## Introduction

Power is one of the most heretical concepts in modern organizations. Not only is power often taboo, an explosive issue that managers and employees avoid talking about, it is also in itself a difficult phenomenon to approach, because the allocation of power is not always transparent.

The aim of this contribution is to emphasize the dynamics of power and leadership relations in organizations. Power is traditionally defined as forms of influence based on the execution of control and sanctions (Hatch 2011; Fogsgaard and Elmholdt 2014). However, in relation to leadership, this definition is insufficient, because the emphasis on explicit forms of power does not fully embrace the concept of power in organizations. This contribution advocates that a more comprehensive conception of power contains three aspects: structural power, personal power, and discursive power. Power is thus considered as an analytical concept in the sense that it is perceived as neither negative nor positive. Rather, the affective value of power reveals itself in the way it is used and executed.

## Definitions and Theoretical Review

### Power

Much research on power has been made in the contexts of the political science, where the concept is described from very different and opposing perspectives. In particular, the following five dimensions have been represented:

1. *Direct and visible* power, as formulated by Robert A. Dahl, where "A gets B to do what B would not otherwise have done" (Dahl 1957). Focus is on the obvious and visible power, where one of the partners imposes their preferences on the other party by virtue of their power resources. Power is thus limited to the activities that take place when interests clash during decision-making. Dahl calls for power analysis to identify A and B as individuals or groups between which there is a visible conflict. The existence of the conflict makes it possible to investigate the extent to which A succeeds in resolving the conflict to his own benefit. This approach consists of identifying and taking a point of departure in an issue or topic (e.g., employment conditions) about which two or more individuals, parties, or groups have directly expressed their opinion. Power analysis then seeks to clarify which of the players control the outcome of the decision-making process and "win" the conflict.
2. *Indirect power*, as formulated by Bachrach and Baratz. Here the decisive power dimension is related to that of learning how to control decisions. By limiting decisions to relatively safe and uncontroversial matters, the organization's rulers can secretly exercise far more power than would be possible through the official decision-making process (Bachrach and Baratz 1962). Bachrach and Baratz argue that an organization's main conflicts will often be hidden. Hence, these hidden conflicts can be made the object of an empirical analysis of power.
3. *Consciousness-controlling power*, as described by Steven Lukes, is directed toward the content of our immediately felt interest. By controlling the consciousness of others, the power holder can ensure that the felt interests of others are more in line with the interests of the power holder than with their own objective interests. The power holder can do this via a hidden ideological control of the prevailing needs, wants, values, and preferences, as they are articulated in the workplace (Lukes 2005).
4. *Structuralized power* concerns how structural factors affect the distribution of power. It is especially formulated in Marxist approaches, where the analysis often deals with the distribution of power between the different classes in society (Clegg et al. 2006).
5. *Poststructuralist power* conceives power as diverse, dynamic, and ubiquitous, which also makes it discrete and hidden. Here power consists in its being linked to relations (Foucault 1982).

### Leadership

In organizational literature, leadership is commonly defined as the task of solving problems

through other people (Yulk 2013). Consequently, leadership comes with power. However, leadership is not necessarily linked to specific positions/people but can be spread across individuals or groups of employees in formal or informal patterns. These patterns vary over time and between different tasks depending on changing power relations. By these means, leadership always involves some kind of *influence*; a manager must be able to influence his followers. Without influence, leadership does not exist. Leadership and hence power are essential if organizations are to function and evolve. As such, leadership can be defined as "a process of influence which gets people to understand and agree on what needs to be done and how to do it, and a process that supports individual and collective efforts to achieve the common objectives." (Yulk 2013, p. 26). It seems meaningful to include Foucault's (1982) understanding of power as a relational and discursive phenomenon. Power and influence can thus be understood as dialectical processes in which power is a tool of influence, and influence is a source of power.

## Power Over and Power To

The leadership pendulum has swung substantially in the direction of a post-heroic leadership style. Today's ideal manager is a soft and caring team player who knows how to involve him/herself and how to dialog with and acknowledge employees in order to facilitate employee development, responsibility, and ownership (Pfeffer 2010). At the same time, every manager knows that not all organizational challenges can be met with participatory, dialogical, and appreciative leadership tools. Sometimes, a leadership task demands that the manager sets the direction more overtly, while at other times it requires employee involvement and coaching. In situations where the manager underscores the structural asymmetry, e.g., by using their right and obligation to hire and fire, it becomes especially clear that leadership is a power-based relationship.

The literature on power represents two general idea-historical lines of power-based relationships (Clegg and Clegg 2002). The first goes back to Thomas Hobbes (1588–1679) and deals extensively with the question: What is power? This question is often described as a "power-over" perspective. One asks, "Who has power over whom?" This view of power is centered on the power structure: Who possesses power, who or what is the target, and how can power be identified? The other idea-historical line asks the question: "What does power do?" This line of thinking can be traced back to Niccoló Machiavelli (1469–1527). It is often described as a "power-to" perspective, i.e., inquiring about how power can be productive. The focus here is on how to concretely exercise power and on the effects it has on the individual's consciousness.

## Power in Organizations

According to the organizational theorist Mary Jo Hatch (2011, p. 1), "Organizations emerge when people work together to achieve a particular desired state or goal." Organizations often consist of a large number of individuals, each with different backgrounds and interests. To get all of these individuals to work together to achieve a common organizational goal is basically associated with power (Clegg et al. 2006).

Previously, organizations were hierarchical and bureaucratic. This form of organization reinforced "power over": Explicit, direct, and apparent power mechanisms (Clegg et al. 2006). Contemporary organizations (at least in a European context) are much more democratic, organic, and dialog oriented. The organizational structure has become more flexible and the boundaries more blurred. At the same time, power has been atomized; there no longer exists an unequivocal center or a distinct structure. Furthermore, recent theories of power in organizations suggest that execution of power frequently occurs in tacit and indirect variants. The concept of power is therefore extended to include discourses, strategic behavior, and socialization. Power is a relational phenomenon since it is not to be understood as an institution, a structure, or as having a specific location (Al-Amoudi 2007). Power relations are instead "immanent in the sphere in which they operate and which constitutes their own organization" (Foucault in Flyvbjerg 1992, p. 112).

## The Triangle of Power

As demonstrated above, the literature on power has been characterized by continuous positioning battles between different dimensions and perspectives. This seems to call for a wider, more nuanced conception of power. The triangle of power is our attempt to develop an integrative and analytical framework of power – referring to a wide spectrum of power and influence dimensions. The triangle of power is elaborated on throughout the rest of this contribution. The strength of not limiting power to a narrowly defined concept is that it secures sufficient openness to what goes on in the field of power and leadership. A multiple power concept can help us sensitize to the diversity of the field and thus sharpen our awareness of the opportunities for changes in power relations.

The *triangle of power* is a model grounded in three different power perspectives that mutually contribute to understanding the working of power within leadership. It will be argued that an analysis of leadership should include all three perspectives and that successful leadership is precisely about balancing these power dimensions. The three perspectives of the power triangle are as follows:

1. *Structural power* contributes with its focus on the positional relationship in the organization and in the formal structure.
2. *Personal approach* contributes with its focus on properties and resources.
3. *Discursive approach* contributes with its focus on the organizational play of language and discursive power struggles, the informal processes.

The three power perspectives are interrelated, as the chart illustrates below (Fig. 1).

**Power and Leadership, Fig. 1** The interrelations between structural, personal, and discursive power

**Structural power**: The structural perspective on power is based on a zero-sum assumption. This means that more power to A means less power to B. This forms the basis for a conflict of interest between A and B as to who should have the power, and whose interests are to be protected. With reference to Robert A. Dahl (1957), power is thus described as a relation of influence between two individuals so that power occurs when A gets B to do something in accordance with A's wishes that B would otherwise not have done. It is a "power-over" perspective, where power is viewed as a resource for the few, a repressive phenomenon that dominates, oppresses, and robs one of their freedoms. It is primarily a mono-centered understanding of power, a top-down perspective on the distribution of power. The organization therefore contains a number of positions, each with their own associated power constellations. Power is linked to specific actions and positions, such as the board, the executive, the middle manager, etc., and these are in possession of different degrees of power depending on their position in the hierarchy. Determining the power distance between the various actors in the organization, as well as their positions, is therefore central to a power analysis, since these factors will have a major influence on their behavior. The structural composition of the organization, e.g., the leadership hierarchy, composition of teams, etc., all contains mechanisms that allow for certain behavioral patterns. Power must therefore be understood as something possessed and imbedded in the person's position in the organization (Parsons 1987).

**Personal power**: The renowned power researcher Steven Lukes (2005) has cautioned us, however, about exaggerating the importance of structural power in the organization. Structural

power never fully determines people's actions. Structural power can limit or promote possibilities for action. In an analysis of power, one should always take into account that individuals participate with a certain degree of free will and a variety of choices. The consequence is that the organizational structures have an influence on the individual, but that the individual, conversely, also has some influence on the organizational structures, e.g., by virtue of their unique and special characteristics. This means that their behavior cannot be reduced to the structural context of which they are part.

In line with the above, Gary Yulk (2013) points out that it is not only within the formal authoritative position in the organization that individuals can possess power. All persons in the organization, in their own way, are in possession of one or more power bases related to, for example, specific skills, previous experience, personal dispositions, personal background, etc. Already in 1959, French and Raven presented a theory of power's "bases" (1959). Bases are power resources, understood as individual or group capacities in the organization. Central for French and Raven is that these power resources function by virtue of the fact that others acknowledge them. They list five types of power:

1. *Reward power*: The possibility to give and withhold reward. In the organizational context, reward power can manifest itself in the form of pay rises, employee perks, fringe benefits, promotion, or an offer to work on more attractive and exciting tasks.
2. *Coercive power*: The ability to punish or sanction. Within organizations, this could be the ability to demote an employee, issue warnings, or deprive an employee of bonuses. Ultimately, it could also be the power to fire the employee outright.
3. *Legitimacy power*: The power attached to a specific position in a given social context. A specific position and its associated power are internalized by the employees through socialization. Legitimacy power is exercised from a position in a social structure where it is customary or agreed that the holder of this position has the right to exercise influence over people in other positions. In an organizational context, the manager can be seen as a clear example of this.
4. *Reference power*: The power that individuals or groups possess due to their characteristics, which act favorably on the surroundings. Identification with the individual or group acts as the key element of this power. People with a lot of charisma are a clear example of reference power.
5. *Expert power*: The power that a person has, by virtue of others recognizing that they possess extensive knowledge and expertise in a particular area

These power resources should be seen in relation to the individual (such as an experience or acquired knowledge) and in relation to the structure (such as institutional features, e.g., that certain professions and expertise are valued higher than others). The model shown below summarizes the characteristics of the structural and personal power dimensions (Fig. 2):

Several leadership scholars have emphasized that the personal power dimension is crucial for creating adherence to the organization's mission and objectives (Yulk 2013). At the same time, it is important to emphasize that regardless of the increasing importance of personal power, managers can never escape their structural positional power. Similarly, it is clear that although a moderate amount of positional power increases the opportunities for personal power, positional power does not guarantee a personal power base (Yulk 2013). It is therefore important to analyze the power strategies used by the various managers, employees, and groups and to view them in interaction with the structural conditions. The interaction between structural power and personal power is a very relevant framework for applying such an analysis. But it does not allow us to take into account that society and the organization have a large number of institutional features which also affect the behavior and the relationship between individuals in organizations. To meet this challenge, a third aspect must be added: discursive power.

**Power and Leadership, Fig. 2** The structural dimension versus the personal dimension of power

**Discursive power**: Our understanding of discursive power is based on Michel Foucault's concept of power. Foucault opposes the traditional Hobbesian understanding of power as something one can own, distribute, or conquer (Foucault 1994). According to Foucault, the traditional understanding of power has its origins in the medieval development of the monarchy, the judicial system, the state and its apparatus and operates using "the law, prohibition and censorship's ubiquitous wheel" (Foucault 1994, p. 90). Power is considered as a mechanism associated with and formulated by the power wielder, such as the monarch, the state, and the parents, over the oppressed, that is, as something negative and repressive (Foucault 2002, p. 41).

In contrast, Foucault emphasizes that power produces and creates: "Power (. . .) is the name given to a complex strategic situation in a given society" (Foucault 1994, p. 99). It is by its nature processual and operational. Foucault looks into how power is exercised, the mechanisms underlying power, as well as its intended and unintended consequences.

## Power Is Knowledge: Knowledge Is Power

In the traditional understanding of power, power and knowledge are seen as separate from each other. Foucault believes, however, that power and knowledge implicate and require each other. He argues that it is necessary "to give up a whole tradition that gives the impression that there can be no knowledge where power relations are abolished, and that knowledge can develop only if free of its obligations, requirements and interests" (Foucault 2002, p. 42). He also points out that an analysis of the relationship between power and knowledge should not take a knowing subject as its starting point. Rather, it is the interaction between the power-knowledge relations that creates new knowledge, because power produces truth (Flyvbjerg 2003).

Power and knowledge come together in discourse to be understood as socially embedded structuring principles of what can be said about a given subject at a given moment in history. Power thus develops between people and operates unnoticed, as discourses, and as the structuring principle of modes of conduct. Foucault describes power as something that comes from everywhere, which means that it operates at macro-, meso-, and micro-levels (Heede 2002). It is through the discourse that language comes to play a central role in relation to grasping power. Foucault's concept of power thus concerns the ubiquitous and discursive focus on relations and language. He argues that it is never possible to reach the truth because one can never speak from a position outside the

discourses. The truth, rather, is embedded in and produced by power systems. As one cannot ever reach the truth, one should give up asking whether something is true or false, and instead focus on how truth effects are created.

### Power Technologies

"Power technologies" are the technologies that seek to determine the behavior of individuals and submit them to goals and forms of discipline and control (Thompson and McHugh 2002). The prominent example of modern power technologies is Foucault's analysis of the Panopticon prison. Designed by the English philosopher Jeremy Bentham (1748–1832), the Panopticon is built so that prisoners, due to the backlight and the building construction, cannot see those who are monitoring them. The Panopticon is an architectural form, which, by putting the individual prisoner in a conscious and permanent state of visibility, ensures that power and the social order are maintained (Foucault 2002). This leads Foucault to the theory of modern leadership discipline. He shows that the prisoner's constant awareness of being under surveillance means that he monitors and disciplines himself. Because of the ubiquitous surveillance from the control tower, the control becomes automated, and the individual internalizes the external power technology. Foucault uses the Panopticon as a metaphor for how power technologies in the eighteenth-century France began to transform sovereign power, in the form of external coercion, into a productive and positive power that regulates and disciplines the subject from within. Every prisoner has to constantly behave as if he was monitored. Foucault shows how power creates subjects who monitor and control themselves by adapting to the prevailing discourses. The point is that different power technologies in different historical periods create different value-related differences for how one should govern and live one's life. Governing discipline is not something that just organizes and structures. It is a production of the orderly, the obedient, and the useful, which acts on and through the body. Many scholars have pointed out that the Panopticon illustration is not just a metaphor for the control of our modern industrial society (Hancock and Tyler 2001). This form of leadership discipline also operates prominently in today's society and organizations.

### Technologies of the Self

Today we tolerate power, says Foucault, only if it has managed to mask its expression. The methods of power have moved from explicit laws and threats of corporal punishment to the use of what he calls "normalization" and "technologies of the self" (Foucault 1994). *Normalization* refers to how different strategies for self-discipline bring individuals to act and experience themselves and each other in ways that are consistent with the prevailing discourse. *Technologies of the self* are specialized techniques that individuals use on themselves, on their own bodies, mind, and conduct, to regulate themselves in accordance with specific interpretations of the world. The spread of self-technologies is part of what Foucault called "governmentality": The way in which a given society influences the individual's inner life by getting the individual to govern himself (Jensen 2005). Examples of this are managers' and employees' self-discipline in relation to the self-monitoring possibilities provided by modern HR tools such as competency, performance contracts, and performance measures. One of Foucault's heirs, the British sociologist Nikolas Rose (Hancock and Tyler 2001), has pointed out that the 1960s largely changed the form of organizations so that the employee took it upon himself to adapt to the company's goals and expectations. An impression was created that the employee was free to live out his or her personal goals. The company's goal, then, was to pursue innovation, flexibility, and competitiveness. Modern leadership, in Rose's words, should "work directly on the self." There is no doubt that Foucault's main contribution to the understanding of power in organizations is his demonstration of the shift of power from being exercised by an external authority to power being supplemented by an inner control.

### Leadership as a Social Construct

Foucault's concept of power is important in a power analysis of an organizational context. It allows us to probe more deeply into the linguistic mechanisms which help to constitute historical and therefore

arbitrary limits for a wide range of acts and forms of consciousness in the organization. With his insistence on power relations containing not just repressive but also a great deal of productive aspects, the discursive understanding of power opens the way toward applying power constructively in leadership contexts. In a discursive perspective, leadership is a social construct, like all other phenomena whose content is determined locally in social interactions. The real manager role becomes a result of subject positions which the manager is invited to take, and the manager invites others to take part in discursive interaction with both subordinate employees and superiors. The manager role is thereby self-created and contingent. The manager is cocreator of a common language of leadership and organization. This attitude clearly reflects the strong focus on language and its impact on the individual's construction of reality. The manager's task is to establish a sense of meaning and direction within the organization by cooperating with employees in order to create common discourses and narratives. These discourses and narratives unite employee experiences into a coherent and meaningful understanding of the employees themselves and the world. The discourses are thus important in that they give meaning to organizational life and constitute the basis upon which the employees carry out their self-managing role. At the same time, the discourses give the employees the experience of personal meaning in their work.

## Conclusion

This contribution has focused on how leadership is linked to power. It has been argued that the three dimensions of power described above are needed in order to understand the complex power dynamics of leadership. It would be an inappropriate reduction to favor one dimension at the expense of others, and it would prevent us from understanding essential features of power relations. It is the manager's job, regardless of the level of consciousness thereof, to react in the power field that often extends itself between the **structural**, **personal**, and **discursive** dimensions.

Leadership is always a power-based relationship. Taking the formal structural understanding of power as a starting point, we have argued that leadership is linked to various positions of power vertically in the organization. However, it is not sufficient to focus on the structural and formal aspects of leadership positions in organizations. Personal characteristics and interaction also play a key role, both positively in relation to strengthening the manager's position and negatively in terms of perceiving a loss of legitimacy. We thus focus on an essential approach to understanding the manager's actions and organizational legitimacy by examining the manager's personal power base and how it is used. The goal of a power-oriented approach to leadership could thus be to strengthen the manager's ability to act through enhanced insight into the dynamics of power in the field of tension constituted by the hard and soft types of power. Foucault contributed by showing us the linguistic and less visible forms of power where the manager becomes part of the discursive practices of the organization and where different perceptions of the organization thrive side by side. This happens without the involved persons necessarily being aware that there are other versions of reality than their own. This perspective begs the interesting question of why some forms of leadership can have greater impact than others in particular historic periods.

In sum, we can conclude that leadership in today's organizations takes place in a context marked by arenas of interaction and contradictions, where antagonism and paradoxes constitute a basic condition. It is essential that leaders understand the complexity and contradictory nature of their work. They must relate to the power field of tension of which they are part by acting appropriately in relation to themselves, their employees, and the organization as a whole.

# Power and Minority Representation

Kenicia Wright
Department of Political Science, University of Houston, Houston, TX, USA

## Synonyms

Active representation; Black; Descriptive representation; Latino; Passive representation; Political representation; Representative bureaucracy; Substantive representation

## Definition

There are two types of representation – descriptive or passive representative refers to the level of similarity in descriptive characteristics, such as one's race, between bureaucrats or politicians and their constituents, while substantive or active representation refers to whether bureaucrats or politicians pursue the *interests* of their constituents.

## Introduction

Representation is a foundational component of democracy and a key piece of the processes of governance and administration. The percent of racial minorities – members of the public who identify Black, American Indian/Alaska native, Asian, and nonwhite Hispanics – is growing. According to the US Census Bureau in 2010, nearly 74% of America's population were White, 14% were Black, nearly 2% identified as American Indian/Alaska native, and nearly 6% as Asian, while slightly more than 16% identified as Hispanic or Latino (US Census Bureau). Population projections estimate that 62% of the American population were White, 12% were Black, 1% were American Indian/Alaska Native, 6% were Asian, and 18% were Hispanic in 2014 (Kaiser Family Foundation 2015). This comparison of population demographics reveals changes in the short time period of 4 years. The percent of the population who identify as racial minority groups is growing as are differences between minorities and Whites in America.

Although racial minorities comprise a growing sector of the public, racial minorities are traditionally underrepresented in American government and bureaucracies. America has a long history of race impacting the quality of life an individual leads. Significant strides have been made since the influence of race from the days of slavery and Jim Crow laws, but race remains an important

determinant of the life of Americans, particularly for racial minorities. When compared to Whites, racial minorities face higher unemployment rates, receive lower pay, and accumulate lower levels of wealth and are more likely to be incarcerated. There are also differences in the education realm as minority students have lower standardized test performance, are more likely to face discipline and to be placed in special education classes, and graduate at lower rates than White students.

Increasing minority representation is viewed as a potential avenue for improving outcomes for minorities in the public. As mentioned, race has important effects. Because of their shared racial identity, many racial minorities often have similar socialization and life experiences. These shared experiences often result in similar political outlooks and behavior among racial minorities and motivate the view that increasing minority representatives will generate positive effects for minorities in society. The logic is that when minorities are in a bureaucratic position or elected to political office, these representatives pursue the interests and behave in the best interests of minorities in the public. These benefits are often generated – as research shows, minority politicians improve the trust minorities of government, have higher levels of satisfaction with their representatives, and are more likely to pursue the interests of minority constituents.

Given these effects, this project examines minority representation as a source of *power*. The effects of minority representatives – whether in the form of elected officials or bureaucrats – are beneficial for minorities in the public, and thus minority representation is a power source. This project begins with a definition of different types of representation and by reviewing common theories/models of representation, such as the delegate vs. trustee models of representation, Pitkin's descriptive and substantive representation (commonly applied in studies of elected officials), passive and active representation (commonly applied in studies of the bureaucracy), and the theory of representative bureaucracy. The second section presents the *theoretical expectations* behind viewing minority representation as a power source, and the project concludes with consideration of the *actual* effects of minority representation. The concluding section will offer insight on whether there is support for the theories that will be described in the first section. There is an extensive line of research on minority representation – far more than can be reviewed in one article – so this project focuses on a mixture of the most important seminal projects on minority representation as well as some of the more recent work in this line of research.

## What Is Representation?

Questions about representation date back for centuries, and there have been many definitions of the concept. In the broadest sense, representation refers to the relationship between elected officials and their constituents. Political representation refers to making the voices, opinions, and perspectives of citizens "present" in the public policy-making process (Pitkin 1967). Representation refers to what political actors symbolize, speak, as well as how representatives *behave* and can result from those in elected or political positions and through those in bureaucratic position. The next paragraphs discuss theories of representation: the trustee and delegate models of representation, a model of representation that is generally applied for elected officials from Pitkin (1967), and representation models commonly applied to the non-elected members of the bureaucracy (passive and active representation).

### Trustee Versus Delegate Model of Representation

Two long-standing models of the appropriate role of representatives are the delegate model of representation and the trustee model of representation. Focusing on the former, delegate representatives are elected by constituents and behave according to the desires on their constituents irrespective of the conscience of the representatives (Mill 1862). Under this model, delegate representatives must act in accordance with the desires of his/her constituents; in other words, delegates are not supposed to go against public opinion. In essence, delegate representatives are

*messengers* who carry out the exact desires of the public. On the other hand, trustee representatives are elected and entrusted to act in alignment with the greater good. Trustee representatives are expected to use their opinions, judgment, and conscience to behave according to his/her own understanding of the best actions for constituents. In this model, it is acceptable for trustees to (temporarily) go against the desires of their constituents so long as their actions are aimed at bringing about the greater good of the public.

### Pitkin's Representation Theories

More recent efforts expand of these representational theories. One of the leading scholars in contemporary theories of representation is Hanna Fenichel Pitkin. Pitkin (1967) offers four theories of representation: formalistic representation, symbolic representation, descriptive representation, and substantive representation. Based on Hobbes' view of representation, formalistic representation emphasizes the formal structures and arrangements that generate a representative government. The logic of formalistic representation is that representation automatically generates with proper forms and processes. There are two dimensions to formalistic representation: authorization (the means through which representatives get their position, office, or standing) and accountability (the responsiveness of the representative to their constituents or how constituents are able to punish their representatives). Symbolic representation is slightly different. Symbolic representation refers to the ways representatives create the perception that he/she shares and stands for the issues important to his/her constituents. This type occurs when something *visible* represents something that is *invisible*; resemblance or reflection is *not* required; symbolic representation is about what the representative means to the constituent he/she represents.

Two additional types of representation are substantive representation and descriptive representation. These types of representation are probably the most common metrics of representation. Substantive representation refers to the actions representatives take on behalf of constituents. This type of representation refers to what representatives *do* when in their office or position. Descriptive representation refers to the extent to which representatives *resemble* or *look like* those being represented. Unlike substantive representation, descriptive representation is about the *appearance* similarity between representatives and their constituents.

### Passive and Active Representation

Public administration research focuses on two types of representation in the bureaucracy – passive representation and active representation. Descriptive representation and substantive representation are often examined in the political context (i.e., elected politicians). Public administration research commonly examines passive and active representation. Similar to descriptive and substantive representation, the types of representation commonly examined in public administration research also involve the appearance of bureaucrats and what bureaucrats *do* when in a position. While passive representation is the extent that a bureaucracy is comprised of people from diverse demographic backgrounds, active representation refers to the pursuit of policies reflecting the interests and desires of people from different demographic backgrounds (Bradbury and Kellough 2007, 697). Scholars who examine these different types of representation often assess the level of representativeness by focusing on race and ethnicity of the bureaucrats. So what is the logic of focusing on minority bureaucrats? Do these bureaucrats adopt attitudes, behave, or have effects that are different from their White counterparts? The next section explores the importance and the theory behind viewing minority representation as a source of power.

## Why Is Minority Representation Important?

### Shared Socialization Experiences with Minorities in Society

Individuals are comprised of many different social identities. These identities affect our socialization experiences, and, in turn, our socialization experiences shape an individual's attitudes and the

behavior he/she engages in. Socialization refers to the continuous process where an individual acquires personality, learns norms, values, behaviors, and social skills. Social identities, such as race, have important influences on socialization and ultimately an individual's political attitudes and behavior. The shared socialization and experiences of minorities lead to minority representatives adopting similar attitudes and engaging in similar behavior as minority citizens; having someone acting on their behalf and pursuing the issues important to them means minority representation is a source of power for minorities in the public.

The *benefits* of minority representation make minority representation a source of power. Minorities in the public accrue these benefits in two ways: from seeing representatives who share a social identity with them in a position or because minority representatives pursue the interest of minorities in the public when they are in a position. The following sections discuss both of these avenues.

### The Theory of Representative Bureaucracy

This logic is captured in the theory of representative bureaucracy, which is a theory commonly examined in public administration research. The theory of representative bureaucracy suggests as the bureaucracy becomes more demographically diverse, policy outcomes will better represent the interests of groups in society. In other words, as it becomes more representative of the public, the bureaucracy will be more responsive to the public (Selden 1997). In the beginning the focus was on bureaucratic representativeness/responsiveness to the dominant class; scholars eventually expanded this focus to include more members of the *general* public. The theory of representative bureaucracy theory also connects passive and active representation by arguing passive representation (such as more racial minorities in the bureaucracy) leads to representation of the interests of racial and ethnic minorities in society (Thompson 1976).

### Linked Fate

The linked fate theory offers more insight on why minority representation is power. The basis for viewing minority representation as a source of power is the perception that when minority representatives gain a position, they will act/behave in a way that benefits minorities in the public. Socialization is one motivation for the premise driving this idea. A second reason we can expect this behavior from minorities is the linked fate theory. Put forth in Dawson (1994), the theory of linked fate argues that because of the dominance of race in shaping the experience of Black Americans, Blacks prioritize the well-being of other Blacks when determining their interests. The premise for this theory is that, given the treatment of racial minorities in the history of the United States, the life chances of individual Black Americans are inextricably tied to the well-being of the race as a whole. In other words, these minorities view their fate as linked to other members of their racial group. As a result of this view of "linked fate," Blacks are expected to vote in alignment with whatever is the best interest of the entire racial group. This sense of linked fate exists regardless of class, education, or income of Blacks.

## Are Minority Representatives a Source of Power? Promising Effects in Extant Literature

The effects of minority representation make minority representation a source of power. Up to this point, the theoretical effects of minority representation have been presented. Given the importance of understanding the effects of representation, there are countless studies devoted to this topic. Many of the studies offer support for the theoretical expectations of the effects of minority representation. The next section will review pieces of literature on minority representation.

### Effects of Descriptive and Substantive Representation

There is support for many of the expected benefits of descriptive and substantive representation. Descriptive representation refers to the similarity in descriptive characteristics such as gender, race, and ethnicity, while substantive representation

refers to representatives who pursue the interests of their constituents. Descriptive representation and substantive representation are often the focus of studies on elected political officials. Although descriptive representation does not *guarantee* substantive representation, descriptive representation often provides the foundation necessary for substantive representation to occur. Descriptive representation leads to higher assessments of government by minorities. Abney and Hutcheson (1981) find Blacks have higher levels of trust in their city government when the mayor of the city is Black than when the mayor does not share their racial identity. Minority political participation is larger in areas with high levels of descriptive representation. Focusing on party and race, Griffin and Keane (2006) find that Blacks who are liberal are more likely to vote when descriptively represented in their state legislature than Blacks who are moderate or Blacks who are conservative. Similarly, there are studies that find Blacks are more satisfied with their government with controls for the party affiliation of the legislator, voting record, seniority, and committee. Notions of linked fate are also confirmed with results that are particularly strong for Blacks and suggest Blacks share similar stances on policies, regardless of class divisions.

Many other scholars examine the effects of minority representation by testing the minority empowerment theory. This theory argues that when groups attain significant representation, members of the group will be empowered in a manner that influences their political participation (Bobo and Gilliam 1990). The General Social Survey (or GSS) asks respondents a plethora of questions regarding their social policy preferences, political attitudes, and opinions of government and politicians. Researchers commonly use GSS data. When there is a Black mayor in the largest city of a primary sampling unit in GSS data, there are increases in socio-political involvement, trust, and political efficacy of minorities in the public (Bobo and Gilliam 1990). Other benefits of descriptive representation are that Black voters are more likely to recall the name, contact, and say they approve of the performance of their representative when the representative is Black than when their representative is not Black (Banducci et al. 2004). Higher levels of minority representation also lead to improved assessments of government by minorities in the public (Abney and Hutcheson 1981); Blacks and Latinos are more likely to vote in state legislature elections in states with high levels of minority representation and higher levels of political efficacy. The effects of descriptive representation also seem to be long-lasting (Gilliam and Kaufman 1998). Similar benefits result from Latino representative; as the amount of Latino representation in state assembly, state senate, and/or US House increases, political alienation in Latinos decreases.

There is also support for the link between descriptive and substantive representation (Banducci et al. 2004; Mansbridge 1999). Descriptive representation not only has positive effects on assessments of government and the political participation of minorities, it also leads to substantive representation in many cases. For example, descriptive representation of Latinos leads to substantive representation of Latino interests. Descriptive representation also results in minority representatives being more responsive to requests for information when there are limited political incentives than White representatives.

P

### Support for Benefits of a Representative Bureaucracy

Similarly to descriptive representation, there are benefits from passive representation. Many studies examine the theory of representative bureaucracy by focusing on education policy. The research suggests there are many positive effects that result from passive representation. For example, minority teachers can serve as "role models" for disadvantaged students, and minority teachers have even been shown to affect how White teachers behave; outcomes also improve when levels of passive representation are high.

Many of the seminal pieces of work testing the theory of representative bureaucracy use educational data. The results of these studies offer

support for the representative bureaucracy theory as there are positive effects from passive representation and active representation, and there appears to be a link that commonly exists between the two types of representation. The connection between passive representation and active representation appear and is most likely to occur when minority representatives are in positions with *discretion*. Selden (1997) examines the effects of minority representation and finds that as the amount of minority teachers and administrators increases, there is a reduction in discrimination and improved student performance.

Similar benefits are found in more recent examination of representative bureaucracy theory. Many of the more recent studies examine the theory using educational data. Kenneth Meier and a host of coauthors have contributed seminal pieces of research in this area. Using data from Texas school districts, Meier et al. (1989) find increases in Black teachers and Latino teachers improve the academic performance of Black students and Latino students. Some examples of these effects include Black students being more likely to be referred for gifted courses when taught by a Black teacher, the benefits of minority representation exist in charter schools as well as traditional public schools, the effects of minority representation are strongest in the South, and the effects are particularly strong for Black teachers who teach lower grade levels.

There are also studies on the representative bureaucracy theory that move outside of the educational arena. When studies focus on administrators, findings generally suggest that Black administrators and Black citizens have very similar attitudes. There is more congruence between attitudes of Black administrators and Black citizens than the congruence between Black citizens and White administrators. The link between this type of passive representation and active representation is also supported as these Black administrators are more likely than White administrators and White citizens to support governmental action that addresses the issues important to the Black community. Many empirical studies confirm a link between passive and active representation for minority representatives, and there are times when the benefits of high levels of minority representation are experienced by nonminorities in society.

## Conclusion

Race is a salient social identity and shapes the life experiences and life qualities of members of societies. The experiences of minorities are marred with difficulties and disadvantage, but these experiences are often shared by members of the same racial group. The common socialization experiences give rise to many minorities sharing similar political attitudes and behavior and are the basis for viewing minority representation as a source of power. This has given rise to the linked fate theory and the logic that when elected to political office or in a position, minorities will *behave* in a manner that benefits minorities in the public.

This paper begins by presenting theories on representation, discussing the logic behind viewing minority representation as a source of power, and concludes with a review of literature on representation. First, models of representation from one of the earliest models (the delegate model of representation and the trustee model of representation) to models common in research on elected representatives (descriptive representation and substantive representation) to models common in research on the bureaucracy (passive and active models of representation) are reviewed. Given the importance of representation, there is an extensive line of research on the topic. The literature review presented here is by no means all-inclusive but covers seminal research as well as important, more recent works on minority representation.

These theories note the possibility for many positive effects from representation. After reviewing *theoretical* expectations, the results in studies in the literature are presented. Many of the benefits theoretically expected are found. Some of the benefits of minority representation include higher assessments of government, higher levels of trust for government, and in some cases increased political participation of minorities in the public.

The major take-away from this piece is that minority representation is a source of power. Minorities elected to political office and minorities in the bureaucracy both have important effects for minorities in the public. These benefits are the motivation for viewing minority representation as a source of power. Recent examinations, however, suggest that the effects of minority representation extend beyond individuals who share the racial and ethnic identity to minorities who do not share the racial or ethnic identity of their representatives and even Whites in some cases.

With the understanding that minority representation is a source of power, there are many promising directions for future research. First, the power of minority representation may actually be larger than the literature suggests. The effects of minority representatives have been examined in a narrow set of contexts, such as where minority interests are known or can be inferred, specific minority decision makers can be identified, and decisions on issues relevant to minority interests can be isolated and linked back to particular decision makers (Bradbury and Kellough 2007). Studying different environments will be beneficial for our understanding of the effects of minority representation.

Another promising direction for future research is further examination of when minority representation generates *negative* effects. Some scholars have already started examining this possibility or have found no effects from minority representation on the attitudes or outcomes of minorities in the public. Future research can build on this by focusing on when minority representation is more likely to result in negative effects than positive effects. Another promising direction for future research is studying what happens when considering more than one identity. In part, this paper presents the effects of one salient identity: race. Since individuals are comprised of more than one identity, another promising step for future research is examining whether minority female representatives are a source of power. A few scholars have started studying minority female representatives, and many scholars have called for greater consideration of interactive effects of race and gender. It would be promising for the future to continue this line of research.

# Power and Minority Rights

Nevena Nancheva
Politics, International Relations and Human Rights, Kingston University London, London, UK

## Introduction

Power and minority rights are inextricably linked. It is impossible to fully understand problems of minority rights without having mapped out the structures of power within the polity. This entry will discuss power and minority rights in order to outline their meaning within the organization of modern politics and to identify what shapes the relationship between the two. The entry will begin by mapping out the normative justification of power in modern public policy. Then it will frame the problem of minorities and minority rights within this normative justification. It will engage with issues of collective identity within the modern state, the construction of political community, the conceptualization of minorities, and the formulation of minority rights at national, regional, and international level. The entry will demonstrate why, in the normative context of globalization, increased mobility, and interdependence, it is problematic to establish institutions of power without considerations of minorities and their rights.

## Power and Political Community

**Definition: Political power is the ability to create and enforce policies on behalf of and for the community**. Political power is thus firmly rooted in a notion of community, and its realm is determined by the boundaries of that community. It makes little sense to speak of political power in general, without specifying the subjects and objects of power. Rather, political power should always be understood within the context of the political community within which it is exercised. Without a political community that accepts, or is forced to accept, the political authority formulating public policies, power becomes meaningless. It is therefore essential to outline what a **political community** is and how it is being enacted and constructed in the realm of public policy. The agency and construction of political community in the structure of the modern state is the key link to the minority problematique and the key justification for minority rights.

### The Westphalian System of Sovereignty

In modern politics, political community has been enacted and constructed on the basis of a particular arrangement which is often taken for granted but which, historically speaking, is rather recent. This arrangement came about at the end of an extended period of warfare in Europe in the mid-seventeenth century over political, economic, and religious autonomy within the context of the fragmenting Holy Roman Empire. The arrangement is rooted in a series of peace treaties signed in the Westphalian cities of Osnabrück and Münster and is often referred to as the Westphalian Peace. The system of understanding contained in this peace arrangement established, among other things, the principle of **state sovereignty** over governed territory, which became the basis of modern politics and international relations.

### Principle of Sovereignty and Self-Determination

Establishing the principle of state sovereignty as the governing rule of modern politics has two significant implications for the dynamics that governed the relationship between power and minorities. The first one is that the Westphalian arrangements created the normative basis for **self-determination**: the idea that political power should be exercised over willing political communities and in according to the expectations of these communities. In the context of seventeenth-century Europe, this referred mainly to the autonomy of local princes and principalities and the choice of religious affiliation. By the end of the eighteenth century, with the French Revolution, the idea of self-determination already referred to the will of *the people* as political actors. The people were seen as a clearly identifiable

community – the community of the governed, who had the right to determine the way in which they were governed. By the late eighteenth and early nineteenth century, that community was increasingly referred to as *the nation*. The **nation** gradually became the shorthand reference for political community within the modern state. And while scholars of **nationalism** have not been able to agree on a single story of the origins of nations (see debates between primordialists and modernists described in Mole 2007), they have managed to reach a broad consensus on the central role of the idea of nationhood in the construction and legitimation of modern **statehood**.

### Principle of Sovereignty and Noninterference

This is closely linked to the second important implication of establishing the principle of state sovereignty: the idea that others do not have legitimate (and legal) rights to interfere in the affairs of a sovereign over their territory. In the tumultuous eighteenth and nineteenth centuries which witnessed the fall of many European monarchs, the legitimacy of the sovereign became increasingly more closely intertwined with the will and expectations of the people who inhabited the governed territory. The need to identify and express the will and expectations of these people in a coherent manner is what laid the groundwork for the inaction and the construction of the **nation**. But not all groups could subscribe to the stories of self-identification that united the nation. Because of irreconcilable differences or because of antagonistic relations, some groups saw themselves marginalized in the process of **nation building**. The claims of nations over political power within their states meant that attempts of such communities to access political power were often seen as illegitimate. The rule of noninterference into the sovereign affairs of a state left non-titular groups with the alternative to either revolt against the holders of power or accept their marginalized position.

### National Political Community and Westphalian Sovereignty

Thus, on the basis of the agreements reached in the Westphalian peace treaties, political power in the modern world became firmly attached to a notion of political community that came to be expressed through the idea of nations and nationhood. Within this political community, solidarity was based on *national identity*. Those groups which could not identify with the nation became marginalized in the **power-sharing** arrangements within the state, as they could not legitimize their claims to power within the logic of national **statehood. National identity** became the ethical justification and legitimation of modern statehood as a form of political **self-determination** and as an expression of the sovereign will of the political community in the face of the nation. This is of central importance to understanding the place of minorities within the political community, their relationship to political power, and the formulation of minority-specific rights.

## National Statehood and Minorities

In the immediate aftermath of seventeenth-century religious wars and the subsequent redrawing of sovereign borders, political solidarity often referred to religious affiliation and place of residence. With the advent of **nationhood** as a common marker, these two criteria were supplemented by common (or similar) language, shared ethnic characteristics, common ancestry claimed on the basis of that, as well as, particularly outside of European mainland territories, shared racial features. These characteristics became the markers of a common collective identity that was described through the notions of **nation** and **nationhood** and belonging to which outlined the boundaries of the political community under the political power of the sovereign state. Within this normative framework sustaining modern **statehood** as a national political project, the place of minorities is rather peculiar.

**Definition**: On the basis of such understanding of statehood, **minorities are all communities under the territorial jurisdiction of a sovereign state that in some way differ or diverge from the common characteristics that outlined the identity of the political community represented by the sovereign state**. In Europe and many of the

dominions of European states across the globe, this identity was often described as **national identity**. This has become increasingly the case even if the basis of community in many parts of the non-Western world has been forged overwhelmingly on the basis of religious, tribal, ethnic, racial, or other shared identity, rather than national ideology. Since minorities can differ from the majority community on any of the common characteristics that outlined the common identity, ethnic minorities, religious minorities, linguistic minorities, etc., can be identified within the state.

### Minorities and National Minorities

The term "national minority" has widely been used to make a distinction between minority communities within a state that represent a majority in another state – which is their ***national*** state – and those minority communities that do not have their own state. An example of the latter are Roma communities in contemporary Europe. Historically, another example have been Jewish communities across the globe. Because of the different priority attached to different common characteristics, both analysts and practitioners prefer to distinguish between national minorities and, for instance, ethnic (such as the Rohingya in Myanmar), religious (such as the Yazidis in Iraq), or linguistic (such as Aramaic speaking communities in Syria) minorities around the world. As the significance of the national aspect of modern statehood has been decisive in the organization of politics today, the term "national minority" can be used in its broader meaning to describe all these communities within states dominated by the political communities of titular nations. In view of the practice of listing national minorities as one particular type of minorities (those that are a titular nation elsewhere), such usage needs to be explicitly specified.

### What Defines a Minority?

The usage of the term "national minorities" as either a general category to describe minorities within the national state or as only one type of minority community among others is relevant to the way minorities have been defined in legislation and the literature. This has been notoriously problematic, as is evident from the application of the term "national minorities" in legal instruments without including a legal definition (example is the 1995 Council of Europe Framework Convention for the Protection of National Minorities) or from the addition of narrower categories together with the term "national minorities" (example is the 1992 United Nations Declaration on the Rights of Persons Belonging to National or Ethnic, Religious, and Linguistic Minorities, henceforth UN Minorities Declaration). Academic literature has attempted to fill this gap by providing conceptualization of national minorities on the basis of objective criteria such as ethnicity, language, culture, religion, and race or on subjective criteria such as self-identification with a minority group. For a detailed overview of both legal and academic definitions, see Chapter II of Jackson Preece (1998).

### Inequality

What is important to highlight in all attempts at defining and conceptualizing minorities is the central role of the relationship between minorities and the holders of political power. By virtue of their very definition, minorities always hold a position of inequality in the context of that relationship. Political power is exercised over a political community within which minorities stand out as different from the majority. The reasons for that difference may be varied. Minorities may have been underrepresented numerically and prevented from equal participation in the processes that led to the construction of the common state identity (indigenous peoples of colonized territories may constitute such minority groups, which in **international law** have acquired their own standing). Minorities may have been deliberately ignored in these processes on the basis of their difference (examples include Jewish and Roma populations). They may have become a minority as a result of territorial border changes (in such cases, the term "national minorities" can be used in its narrower meaning to describe, for example, Hungarians living in Transylvania under the jurisdiction of Romania or Germans living in South Tyrol under the jurisdiction of Italy). Minority communities may have come into being as a result

of long-term migration settlement (such as Afro-Caribbean communities in the United Kingdom which settled in the 1950s–1960s in the context of decolonization). Minority communities may have been formed as a result of segregation on the basis of cultural and religious practices that gradually distinguished a group of people from the larger community within which it existed (e.g., the Haredi community within the Jewish population of Israel). Minority communities may have been created also as a result of political processes of state formation including two or more ethnically or linguistically distinct communities (such as the processes that led to the creation of the states of Belgium, France, Spain, the United Kingdom, etc., with their Walloon, Basque, Catalan, and Welsh communities, respectively). Irrespective of the circumstances in which a community found itself in a minority status within a state, what characterizes this status is the *unequal position* in terms of the exercise of political power. This is true even in cases when communities enjoy numerical parity with or advantage over the titular nation, as the example of African-Americans before the 1964 Civil Rights Act in the United States or the Blacks under the apartheid regime of South Africa demonstrates. This inequality is what characterizes most visibly the problematique of minorities and power, in terms of both the problems plaguing minority communities, and the measures taken to solve them.

## Minorities and Problems of Inequality

Based on the experience of minority communities worldwide, four major concerns can be identified that are rooted in the unequal position of minorities in terms of political power within the state.

### Survival and Existence

In the most extreme end of the spectrum of concerns stand the problems of **the survival and the existence** of minorities. The survival of the minority community is at stake when the holders of political power deny minorities a physical place in the political community of the state. This has often been the outcome of political projects which rely on homogeneity for the building of solidarity or whose success depends on narratives of victimization and practices of scapegoating. In their worst versions, such political projects have led to **ethnic cleansing** and **genocidal campaigns** aimed at a specific minority group. In most recent history, examples include the Bosnian Serbs' campaign of ethnic cleansing against the Bosniaks in Bosnia and Herzegovina during the war of 1992–1995 or the Hutu-dominated government's genocidal campaign against the Tutsi in Rwanda in 1994. Nonviolent political projects can also be aimed against the survival of a minority group, if they imply denying the existence of the minority as a separate community. France, for example, has maintained that no national minorities exist on its territories. Greece has claimed the existence of only one religious minority under its jurisdiction – the Muslims of Thrace. For minority concerns in so-called denial states, see Malloy (2014).

### Identity

Another problem linked to minorities' unequal position with regard to political power within a state concerns lack of appreciation for the minority group **identity** as a value in its own right. Since the basis of solidarity within national majority dominated states is the majority's identity, all divergent group identities may be neglected as irrelevant to the political community or, worse, threatening its stability. Where the group identity of minorities is not appreciated as valuable, the outcome is either gradual assimilation of the minority group within the majority community or increasing **segregation**. A prime example of this concern is the lack of appreciation of Roma communities' way of life within a series of European states.

### Inequality and Discrimination

A third problem in minorities' relationship to political power is the **inequality** of **access** to social goods and **discrimination** toward minorities in the public and private spheres of social life. Both aspects of this problem are often rooted in the very differences that distinguish members of the minority group from those of the majority. A segregated place of residence, a different

mother tongue, the use of religious symbols or pieces of clothing such as face- or head-covering scarves, and a distinctive diet can become impediments to equal access to social goods such as schooling, health care, social services, and employment opportunities. Such distinctive features can also be used as a basis for discrimination by providers of public services or by private sector employers.

### Nonparticipation

Finally, even if all of the above problems have been addressed by the holders of political power, and measures have been taken to prevent them, it still does not mean that minority groups can enjoy **effective and meaningful participation** in the political community of the state. The national makeup of the modern state has placed the titular majority community at the commanding heights of political power by virtue of the very processes of state formation and solidarity building within the state. Therefore, a deliberate legislative and public policy effort is often required to ensure effective engagement of the minority community in the exercise of power and meaningful **participation** of representatives of the minority in the public life of the political community of the state.

## International Minority Protection: Emergence and Features

Acknowledging the unequal position of minorities within the structures of power of the modern state has given rise to normative thinking about providing redress to such inequality. This occurred within the international political realm, since national politics found no normative contradiction between national sovereignty and the marginalized position of national minorities. This is how the idea of **international minority protection** was born. Gradually, international negotiations on minority protection created legal principles and established practices that became the basis of a **minority rights regime**. Unsurprisingly, the emergence of the minority rights regime has revolved around the four main areas of concern identified above. International minority protection currently includes measures ensuring the survival and recognizing the existence of minorities within national legislations, measures protecting the collective identity of the minority group, measures ensuring equal opportunities and providing guarantees against discrimination, as well as measures enabling effective and meaningful participation in all aspects of public life.

But these measures have neither been universally accepted nor meaningfully implemented by states around the world. Minority protection is seen as an issue of highest importance to the holders of political power worldwide, because it relates directly to the normative justification of sovereignty. It implies an acknowledgment of the normative shortcomings of national sovereignty and an agreement to curtail the dominance of the titular majority within the structures of sovereign power. This is why minority protection regimes have been so hard to formulate and to implement. It has variously been argued that no special minority protection is needed if the rights of everybody are guaranteed by national laws, that specific individual rights relevant to minorities are sufficient to ensure equality, that broader minority protection implies collective rights which are incompatible with the legal rights of nonminority citizens, or that guaranteeing **human rights** is the best possible way to provide equality for everybody in the modern state. These arguments have marked the emergence and implementation of the modern minority rights regime. Nevertheless, we can identify some of its defining features as they have been recognized in the interpretation and practice of minority rights in the realm of **international law**.

### Special Measures

Currently, it has been widely acknowledged that measures of minority protection often imply differential treatment of members of minority groups that aim at correcting existing inequalities and past injustices. Differential treatment in public policy is usually dressed in the form of **special measures**, which are envisaged by several international legal instruments, including the 1969 UN International Convention on the Elimination of

All Forms of Racial Discrimination. Special measures can be variously described as "affirmative measures," "affirmative action," or "positive action" and are temporary policies that aim to supplement the already guaranteed legal rights of members of minority groups as human individuals. The rationale behind such special measures is that often individual rights are insufficient to ensure adequate policy responses to all minority concerns, especially when taking into consideration the long-term position of inequality within the political community of the state.

### Individual Versus Collective Rights

The consensus within the international regime on minority rights that special measures are an adequate – and necessary – policy response to minority concerns, however, is a relatively recent development. It refers to the UN Minorities Declaration of 1992 (UN General Assembly Resolution 47/135) and the recognition that, to fully enjoy their individual rights, members of minorities also need, as a group, some targeted assistance on behalf of the state. This recognition opened the conceptual and policy debate on individual versus **collective rights** for minorities, undertaken by proponents of **liberalism** as political ideology (see Kymlicka 2000). Throughout the Cold War period, the general international agreement had been that it sufficed to guarantee individual **human rights** for everybody, including members of minorities. Any minority norms created within this period retained at all times their focus on the individual ("persons belonging to [such] minorities" instead of "minorities"), even if they conferred minority-specific rights. A prominent example is Art. 27 of the 1976 International Covenant on Civil and Political Rights which has been interpreted as containing a specific permanent right to individual members of minorities (to enjoy their own identity), in addition to the other rights they enjoy in common with everybody else.

### Collective Rights: From Religious to National Minorities

But the normative preference for individual rather than collective minority rights should also be seen from a historical perspective. In fact, most historical references to minorities discuss, in policy terms, **collective rights**. From the Westphalian peace agreements formulating rights to faith practices for religious minorities within Europe's redrawn boundaries to the millet system of non-Muslim confessional communities' self-governance within the Ottoman Empire, rights were granted to the minority community as defined by its chief identifying characteristic. In the times of empires, this used to be ethno-religious rather than ethno-national identity. Due to the nature of the imperial state, it did not make political sense to enact and construct the political community of the state as monolithic. So group identities within the state did not pose threats to political power, as long as they acknowledged its legitimacy. With the rise of **nationalism** as an ideological justification of political power, however, this started to change. Political organization along ethnic lines (whether on religious, linguistic, or other common basis) began to be seen as a threat to power, because of the claims to national **self-determination** and **sovereignty** that it implied. It is indicative that in the years preceding and following the First World War, minority concerns were very high on the international agenda, and minority clauses were the subject of extended negotiations among the Great Powers and between victors and defeated after the War. The system of treaties created as a result of the 1919 Peace Conference in Paris and within the framework of the League of Nations contained important minority clauses that address nationalist claims within a number of states. These clauses already clearly linked minority identities with state power by defining them as "national," even as their defining characteristics may have been ethnic, linguistic, or religious belonging. In this period, collective minority rights were still not seen as problematic within the international protection regime.

### Individual Rights: From Minorities to Human Rights

It was with the Second World War, the acknowledgment of the aggressive potential of ethnic

nationalism, and the spread of communism that **collective rights** began to be viewed with suspicion. The creation of a universal regime of **human rights** as the common project of humanity and the United Nations within the framework of the eponymous organization was upheld as a solution to inequality. In the context of universal human rights, discussions about minority rights soon became superfluous. But analysts argue that the universal human rights regime had been the sovereign nation-states' compromise on addressing minority inequalities within their borders by subscribing to grand universal agreements that had no binding legal force within national jurisdictions (see Mazower 2004). The Cold War bloc opposition made interference within sovereign borders highly problematic, thus reinforcing the point that attempts to enforce or even discuss minority rights were out of the question. It was only after the Helsinki process had gained speed and the communist bloc had started to disintegrate that minority rights as *specific* rights and as *group* rights returned to the international political agenda. The adoption of the UN Minorities Declaration came to indicate that.

## Sources of Minority Rights and Mechanisms for Protection

The UN Minorities Declaration is the main source of minority rights under the international human rights regime. It contains clauses that cover the full spectrum of concerns with minority inequalities: from physical survival through nondiscrimination to effective participation and representation in public life, including within the institutions of state power. Within the framework of the UN treaty bodies, mechanisms have been developed to address minority concerns, especially under the mandate of the UN Independent Expert on Minorities Issues established in 2005 and within the Forum on Minority Issues established in 2007. These mechanisms suffer from the widely recognized limitations of being dependent on nation-states' cooperation and being constrained by national sovereignty. However, their contribution to elaborating the international standard of minority protection should not be underestimated.

Within the international regime of minority protection and as a consequence thereof, effective regional minority frameworks have also been created. A good example is the system of minority governance established in Europe. In 1993 the Organization for Security and Cooperation in Europe assigned to a High Commissioner on National Minorities early warning and monitoring tasks with regard to minority grievances. The High Commissioner's work on creating guidelines on various aspects of minority protection has been unparalleled. Under the Council of Europe, the first international treaty with a multilateral, general protection regime for minorities was created: the 1995 Framework Convention for the Protection of National Minorities. The document mirrors the universal regime in that it upholds nonbinding standards and lacks sanctions for nonobservance. It has, nevertheless, been significant in sustaining minority protection in the region because it has created a framework within which minority-specific legislation could be adopted and special measures for substantive equality of minorities could be taken. It was this regional regime that the European Union upheld as its own standard, when it included minority protection as one of the conditions of membership. See Henrard (2004) for a useful overview of that process.

## Conclusion

The European framework is the best developed international system of minority protection. But it is also significant in its explicit focus on national minorities as a policy priority. Generally, the system understands national minorities, much in line with the UN standard, as defined on the basis of ethnic, religious, and linguistic difference. This does not mean that the European human rights framework does not engage meaningfully and effectively with minorities identified on the basis of gender, disability, or, indeed, race. But the elaborate focus on national minorities recognizes the significance of these

minority groups in terms of maintaining political solidarity within the modern **nation-state** – whose model has been forged in Europe. National minorities appear as an aberration from the logic of national statehood, by challenging the link between nationhood and the state. Yet, all nation-states contain communities different from their titular majorities. The processes of globalization seem to be reinforcing this fact, by creating new types of minority communities (the so-called new minorities) or by making minority grievances politically more visible. In the context of globalization, all states appear to be ever more **multicultural** (Parekh 2006). This is precisely what presupposes the need for explicit minority protection within the current organization of politics and determines the relationship between power and minority rights.

## Synonyms

Power: Capability; Control; Dominance; Force; Influence; Strength.

Peace: Balance of power; Concord; Development; Freedom; Goodness; Harmony; Human rights; Order; Social justice.

## Introduction

Throughout history, the concepts of "power" and "peace" have been dominating as well as widely talked topic in the academic and political arenas. Different nations in the long journey of history have showed consistent passion for seeking and exercising power. Human beings are equally peace loving and peace pursuers and, thus, have sacrificed a lot for the quest of peace. However, thousands of wars and an uncountable number of deaths have occurred in the different phases of history. For this scourge of wars and casualties, human beings have negotiated, compromised, and signed treaties between and among nations for establishing peace and security. This complex situation of wars and craving for peace have founded the concepts of "power" and "peace" across the disciplines, such as political science, sociology, public administration, international relations, and peace and conflict studies. This essay will discuss the conceptual development of both these terms – power and peace and their interrelationship.

## Definition

### Power

Power, as a complex and an elastic term, has been defined differently in various disciplines;

however, the core meaning of the power is the capacity and capability of different actors – from an individual to states – to influence the actions and behavior of another actor (Dahl 1957). Although power has been a core principle of discussion in the discipline of social sciences, there is no comprehensive definition of power yet. In a simple sense, power is the capability which is relatively enjoyed by few people over others. For example, a state is called powerful when the country has enough capability in terms of economy, military, and strategy to influence and control of at least a few or more number of states. The Webster's Third International Dictionary of the English Language defines power as "a position of ascendancy; ability to compel obedience; 'control' 'domination'" and is closely associated with this: "a military force and its equipment" and "ability to wage war" (Webster's English Dictionary 1981). This definition signifies the dominating and controlling characteristics of power which is perhaps the central concept in the literature of political science for determining the relationship between and among states. The Merriam-Webster Collegiate Dictionary similarly defines power as "possession of control, authority or influence over others" and "one having such power, *specif.* a sovereign state" (Merriam-Webster Dictionary 1996). Therefore, power is defined as control, dominance, possession, and influence which is applied describing relation between people and groups and even state to state relations.

### Peace

Peace is the "absence of violence" (Galtung 1969, p. 168). This is the most common definition of peace that refers to absence of all forms of violence, war, confrontation, and any kind of negative actions against people. However, the definition of peace demands more than the absence of violence. Like "power," peace is an elastic term that conveys comprehensive and varied meanings. Philosophers, religious thinkers, and political activists have defined peace and war from different perspectives since the inception of human history. The Oxford English Dictionary refers to peace as "freedom from or cessation of war or hostilities; freedom from civil commotion and disorder; freedom from disturbance or perturbation; freedom from quarrels or dissension between individuals" (In Rummel 1977). Peace in religious perspective is meant as serene, spiritual, and mental goodness of man. Pacifists define peace as the highest good of the society that can be attained through nonviolent social change. Peace is also conceded as the social order, social contract, and a state of social concord between nations. Early philosopher Saint Augustine defined peace as the "well-ordered concord between those of the family who rule and those who obey" (In Zwitter and Hoelzl 2014, p. 319). Peace is also meant as the harmonious state of mind and social relations. The medieval political philosophies, on the other hand, define peace as the social contract between the rulers and ruled. According to the legal, peace is legally binding peace treaty between and among the nations for limiting state behavior and avoiding confrontation and conflicts (Kant 1795). Peace is also viewed as the power, force, and coercion in an authoritative and persuasive manner to influence the violent behavior of the individual, groups, and the state for attaining peace. Peace is a balance of power among the nations or establishing equilibrium of power between and among the power blocks.

## Discussion of Power

Since the Greek city state power has been a central issue in analyzing the social and political relations in every nation state. From Plato and Aristotle through Machiavelli and Hobbes to Pareto to Weber, power has occupied a key position in the discussion of relations between group, nations, and states (Dahl 1957). Power in the ancient time was seen as the power of virtue and innate goodness of human being. Plato's seminal work "Republic" centralized the concept of justice and power. Plato's teacher Socrates believed that "justice cannot be seen as the unqualified good unless it is interlinked with the human power" (In Lycos 1987, p. 2). This is a reality in all social systems as human relation depends on the mutual understanding and exercising power. But the nourishing

of power in any given society should be used in such a manner so that all members of the society negotiate and satisfy with the values and behavior of other members. This is not the coercive imposing of decision over the majority people but a cooperative and consulting exercise of power. In early modern period, Hans Morgen thus, defined power as:

> When we speak of power, we mean man's control over the minds and actions of other men. By political power we refer to the mutual relations of control among the holders of public authority and between the latter and the people at large. (Morgenthau 1973, p. 26)

In the context of social relations, some political sociologists have defined power as the capability of individual person to influence the behavior of other people and members of a group. Max Weber demonstrates power as the probability that one actor within a social relationship will be in a position to carry out his own will despite resistance (Weber 1978). In this regard, the social relation is referred to a constructive social relation in where power should be exercised for ensuring security and benefit for all people in the society. Some sociologists have viewed this "security" as the absence of anxiety from the mind of the people in their social and political setting. Beyond the concept of "dominance," Foucault (1980) argued power as the relational force that helps all social beings to be united and come into the web of mutual influences (Foucault 1980). According to this view, power is constructive and productive force that permits all people in a social setting to come into a hierarchy and mutual social benefit for all. Giddens (1984) has given similar view about power by arguing that power is the "transformative capacity" and power is not always associated with conflict; rather, power obliges cooperation among people for their benefits (Giddens 1984).

With the development of sovereign nation, state power has been characterized as the capability and performing abilities of individual state within and beyond the boundary. Power in this context refers to military strength, economic sufficiency, performance of the governance to attain internal stability, and also the sustenance of the government to absorb pressures that come from outside of the border. In fact, the concept of powerful state laid down the philosophy of competition among the states to become powerful and keep dominance on other states. In nineteenth and twentieth century, some states in Europe had been engaged into an unholy struggle of capturing power for expanding their state boundaries. Military power was primarily used by the colonial masters to keep dominance and expand their territory. The United Kingdom, Germany, and Italy severely used military power and have been able to expand their boundaries occupying states all over the world. Morgenthau (1973) has termed this system as "the international system struggling for power" (Morgenthau 1973). Colonial expansion by the United Kingdom is regarded as the "Pax Britannica" or the British in the Europe and the world through dominance and hegemonic construction.

During the twentieth century, the concepts of collective power, cooperative power, or "shared power" have appeared in international system to redress and deter unwanted tyranny, aggression, and war. This type of power is grounded on the collective strength of at least few or many states who are ready to use force in case of emergency. The establishments of the League of Nations in 1920 and the United Nations in 1945 were the reflection of cooperation which laid down the concept of "collective power" and "collective security" for all nation states. Collective power is defined as the state power and capacity of the international community for the common benefits for the nations. Here, the common benefit is meant as the territorial integrity and ensuring peace and security for each and every nation. Johan Galtung (1985) defined power as "the power of a system is its influence potential, i.e., its potential to induce it will on other systems" (In Carroll 1972, p. 586). System is referred to the political system of a state that influences other political system in a rational manner.

Power in the modern period is demonstrated as the capacity of a state which is measured on the basis of some indices, i.e., population, geographical position, natural resources, national product, economic strength, military forces, and budget (Krasner 2009). The national character of a state,

quality of the government, national morale, diplomatic character, technological know-how, education, social mobility, and political and religious charters are also measured as the sources of power in current political situation (Carroll 1972, p. 587). However, peace researchers have suggested an alternative concept of power which considers power as the "collective form of power" bestowed upon the overarching institution for exercising through the consultation and compromise for attaining common goal (Singer 1963).

From the discussion of "power," it is evident that there are different forms of power such as dominance to cooperative, "soft power" versus "hard power," and destructive power to constructive power. Soft power or constructive power is a form of power required for reshaping the social system through cooperation, mediation, personation, balance, and negotiation between and among the people in a social setting, whereas "hard power" or power based on dominance, is the military might, economic dominance, and hegemonic construction. Power is also legitimate and illegitimate in nature. Legitimate power is derived from the constitution within the country which prescribes rules of business for the government to operate the functions of the state. In the international system, legitimate power is attained through establishing alliances or organizations where states confer upon their individual power for the collective benefits; on the contrary, illegitimate power is founded on the force and repression and exercised against the will of the people. In the international context, illegitimate power is referred to a system in which power is exercised out of the rules and regulations prescribed by the international organizations, like the United Nations and International Court of Justice.

## Discussion of Peace

Although peace has been defined in different perspectives, the development of peace research has been initiated to study peace systematically. Thereafter, peace is discussed in the negative and positive perspectives taking into account the violence and insecurity existed in individual state and international system. The negative peace is the absence of direct, intentionally organized violence, whereas positive peace is social justice, welfare, as well as absence of physical violence (Carroll 1972, p. 599). Johan Galtung has popularized the term peace in the academic discussion of political science, international relations, and peace and conflict research coining it with direct and structural violence. In analyzing the concept of peace, Galtung (1969) has mentioned three principles: peace is the social goal which should be agreed by the common people; the social goal is difficult, but it is not impossible to attain; and the last principle is the absence of all kinds of violence (Galtung 1969, p. 167). The core meaning of these principles is the perfect social order where violence, confrontation, and conflicts are absent. Galtung (1969) termed this concept as the negative peace which is attainable by eliminating human's personal drawbacks such as psychological and physical attacks; hindrance is absent (Galtung 1969). However, Galtung (1969, 1985) and other peace researchers have expanded the meaning of peace considering the social and political reality and growing needs for the human beings. Peace, under this context, is defined as positive peace which means presence of human rights, social justice, cohesion, and material benefit for the realization of human potential and development. Positive aspects of peace can be attained through the elimination of both direct and structural violence from the society and international system (Galtung 1985). Social justice replicates this peace for the attainment of mental and physical well-being of the people.

Jon Barnett argues that Galtung's positive peace concept is not clear to understand and comprehend peace comprehensively (Barnett 2008, p. 75). Therefore, peace has been associated with the meaning of development, sustainability, and human cooperation for achieving common goal. This is also called the "lasting peace," "green peace," or "sustainable peace." Barnett (2008) defines peace combining the theory of "absence of violence" (Galtung 1969) and presence of "human freedom" (Sen 2014). The absence of violence protects people from being physically harassed, and the presence of human freedom

ensures the realization of human potential and choice to do whatever people like. So, peace as a comprehensive concept is meant not only the absence of war, confrontation, exercise of any forms of violence in group, national and international perspective, but also presence of conductive social and political system where human potentials are fully realized and actualized. More specifically, peace refers to the presence of human rights, human freedom, sustainable development, and ensuring basic and fundamental needs of the people. Positive peace implies on overall environment of a society where people can flourish them without any hindrance. Peace is, therefore, broadly defined as the nonviolent social change, social justice, ecological sustainability, and popular participation of people in all domains of social and political relations.

## Interrelationship Between Power and Peace

The above definition and conceptual discussion denote that both the terms power and peace are closely related and at the same time opposite from each other. Power is perceived as the way or medium of establishing peace; on the contrary, power is considered as the main spoiler of peace and security of humanity. Therefore, question has come whether power is detrimental for peace or power promotes peace. One school suggests that exercising power hinders and hampers peace and security for all or at least for a section of the people over whom power is exercised. Power is destructive based on the dominance that undermines human potential and interrupts human progress. Another school suggests that peace is a normative idea which believes in promoting both human and social progress. Power does not promote comprehensive security and development for all people; rather, it brings security and prosperity for the few in expense of harmony and peace of the majority of people. Peace is a holistic approach and takes stance for opposing any kind of forces and power in the national and international system.

Power is closely associated with armament and ownership of the lethal weapons. Sophisticated weapons are considered as the symbol of modern power in many respects. Powerful states are heavily engaged in arm race, production, marketing, and the ownership of sophisticated weaponry system. Powerful states, blocks, or alliances perceive weapons and military technologies which are the only means of acquiring power and keeping dominance over the other states. On the contrary, peace researchers consider the weapons and military technologies as the main spoiler of peace as well as the main elements for damaging environment and development efforts. War and conflicts are inherently connected with the armament and arm race. Peace researchers also consider this arm race and sophistication of weaponry system of as "threat system," which encourages the use, production, and research on arms and ammunition in the world. This threat system is often blamed as the main instrument for threatening peace and security. In the domestic arena, the "threat system" is equally applicable as and when a government or ruling class imposes excessive power and dominance controlling the social institutions by the low enforcing agencies. Under this condition, peaceful situation and human rights condition are seriously hampered. The use of power by few and unequal distribution of power in the regional and international system also contribute to emergence of structural violence.

But modern peace researchers opine that power is a necessary instrument for establishing peace and security. Kenneth Boulding (1989) argues that power is the ability to change the future. Power promotes peace when people interact with each other and surrender their realistic power to cooperation power. Kenneth Building (1970) has termed this power as "exchange power" and "integrative power" which lies on the will of the people (Boulding 1970). Under this view, power has been presented as the constructive power which is the strength when people, nation, and states come forward to combine their power as a force against the tyranny, injustice, and any kind of odds against the humanity. History shows that lasting peace was established in different phases when nation states compromise their power and come into cooperation and common ground. Immanuel Kant (1795) mentioned that war is inevitable in the society; therefore,

"republican" constitution is essential for attaining perpetual peace in the society (Kant 1795). The example of Westphalian peace treaty in 1648 and creation of the United Nations in 1945 are the examples of how nation-states compromised and surrendered their individual power to the common power.

Buzan (1984) has depicted the objectives of power and peace in international system. Peace promotes the attention of eliminating all forms of violence in regard to the relations between and within states. The concept of peace argues that insecurity in any social system is existing for the anarchy and unequal power distribution; therefore, elimination of roots of wars and conflicts is extremely essential. On the other hand, concept of power gives priority to the individual state who can be controlled internally as well as pursue interest within the state system. The concept of power identifies the problems of insecurity and conflict within the unit level and thus urges to solve the problem using power rationally both within the country and international system.

## Conclusion

In sum, it can be concluded that power and peace are opposite in terms of meaning and application, but in some respect complement for each other. Power as dominance and control is used for waging war coming from the outside and managing resistance coming from within the state. Power in this case is being institutionalized for maintaining statuesque of the government or the state. This process according to the realist perspective is essential for peace and security of a country. However, exercising power for the goal causes sufferings and destruction instead of establishing peace and development in many places in the world. Even the liberal democratic countries exercise power over its citizen as a tool of capturing and exercising political power. On the other hand, power is also seen as a tool for establishing peace when it is exercised collectively or based on the internationally accepted norms and values. For this ground, people are still rethinking how best the power can be exercised for the sake of common benefit and well-being of the people in the universe.

# Power and Politics in the European Union

Imdat Ozen
Department of Political Science and Public Administration, University of North Carolina Charlotte (UNCC), Charlotte, NC, USA

## Synonyms

Confederalism; Exclusive EU competence; Federalism; Intergovernmentalism; Shared competence; State powers; Supranationalism

## Definition

The European Coal and Steel Community (now the EU) has grown in size to 28 member states that have joined together, with some others on the waiting list, to build a common economy, government, and culture. The European Union is the most successful experiment in international cooperation, but also the most complex system where powers and responsibilities are shared horizontally among interdependent institutions (European Commission, European Council of Ministers, European Parliament, European Council, and European Court of Justice) at the EU level and vertically between the EU and the member states (Hay and Menon 2007). The power or policy authority in this complex system is divided into three different categories such as exclusive EU competence, shared competence between the states and the EU, and the responsibility of member states. As McCormick describes, "Competence is a term used to indicate responsibility or authority in an area of public policy. Article 2 of the Treaty of Lisbon points out that Exclusive EU Competence in a policy area means that only the EU can legislate or adopt legally binding acts related to that area, and that the member states can only do this themselves if specifically empowered by the EU or in the interests of implementing an act of the EU. The EU has Exclusive Competence in only five policy areas-competition, customs, fisheries conservation, trade and- within the euro zone – monetary policy. Levels of competence in all other policy areas (except those where the member states have clearly retained their authority) are debatable" (McCormick 2015).

## Introduction

In the wake of World War II, statesmen such as Jean Monnet and Robert Schuman of France and Paul Henri Spaak of Belgium believed that a united Europe was essential to preserving peace and security and preventing another war in Europe. In their opinion, controlling coal and steel (building blocks of industry and raw materials for weapons of war) would ultimately result in the reconciliation of Europe. France and Germany, the two main rivalries of Europe, would combine their coal and steel production. They all agreed on the creation of a new body within which responsibility for coal and steel production could be pooled. In 1951, France, West Germany, Italy, and the Benelux countries (Belgium, the Netherlands, and Luxembourg) signed the Treaty of Paris that led to the creation of the Coal and Steel Community, a first step in the process of building the United States of Europe. The same six countries signed the Treaty of Rome in 1957, which established the European Economic Community. EEC's main goal was to create a single market which is a multistate economic area (known as a common or internal market) in which there is a free movement of people, money, goods, and services called four freedoms. Since then, in many areas of political and economic life, power has been gradually transferred from the member states to the European Union and its various institutions. For example, the European Court of Justice (similar to the US Supreme Court), which is one of the main institutions of the European Union, has weakened the sovereignty of member states of the EU by declaring that the laws of the European Union are supreme in relation to the laws of individual states in certain areas of public policy (Payne 2011). Although today's EU has its own military (Rapid Reaction Force), anthem (Beethoven's Ode to Joy), flag, holiday (Europe Day on May 9),

motto (Unity in Diversity), regulations, laws, and governing structures, the EU is not a single state yet, as is the United Kingdom and Germany. This status quo of the European Union creates a tension between intergovernmentalism (rights, interests, and powers of individual states) and supranationalism (rights, interests, and powers of the EU itself). While intergovernmentalism wants to retain the powers of the member states within the EU, supranationalism wants to take power away from individual states and invest the EU with greater authority (Kubicek 2012). The purpose of this article is to study and evaluate the politics and power distribution in the European Union.

## Politics and Power Distribution in the European Union

The European Union itself has an exclusive competence when it comes to making policy in competition, customs, fisheries conservation, monetary policy in eurozone, and trade, but the member states still have a higher degree of control over education, elections, defense, tax policy, postal services, local transport, land use, healthcare, policing, citizenship, broadcasting, and criminal justice. In most areas of policy, there is a wide overlap of powers called shared competence between the EU and its member states such as agriculture, cohesion, consumer protection, transport, trans-European networks, space policy, social policy, single market, research and development, development cooperation, energy, immigration, humanitarian aid, environment, external relations, freedom, security, justice, economic policy, employment policy, civil protection, culture, public health, etc. Therefore, the power or policy authority in the European Union can be divided into three different categories such as exclusive EU competence, shared competence between the states and the EU, and responsibility of member states. The concept of competence is the key to understand the division of powers in the European Union. As McCormick describes, "competence is a term used to indicate responsibility or authority in an area of public policy. Article 2 of the Treaty of Lisbon points out that exclusive competence in a policy area means that only the EU can legislate or adopt legally binding acts related to that area and that the member states can only do this themselves if specifically empowered by the EU or in the interests of implementing an act of the EU." As indicated above, the EU has exclusive competence in only five policy areas. Levels of shared competence in all other policy areas (except those where the member states have clearly retained their authority) are debatable. In policy areas where competence is shared, it is not always clear how far it is shared; in some areas the EU has authority only to support, coordinate, or supplement the work of the member states (McCormick 2015). Basically, outside the areas of exclusive EU competence, it is a matter of debate how much responsibility the EU has.

The power distribution of the European Union is similar to the governmental power distribution of the US federal system. Just like in the European Union, the governmental power of the USA is also divided into three different categories such as national powers (enumerated powers), concurrent powers, and state powers (reserved powers). While the federal (national) government and state governments share some powers, such as the ability to tax, make and enforce laws, charter banks and corporations, borrow money, and spend money for general welfare, each government is supreme in some spheres (O'Connor et al. 2011). In addition to the power distribution, the EU has some other qualities that make some scholars believe that EU is a federal system such as having one flag, one anthem, two levels of law (European and national), a separate executive branch (the European Commission), a separate legislative branch (the European Parliament and European Council of Ministers), and a separate court (the European Court of Justice) that coexist and share powers with their national equivalents, one currency (Euro), that is used by 19 countries in the EU. Since the European Union has not completed its evolution yet, the similarities between the EU and federalism are not enough to define the European Union as a federal system. Since the EU also has some qualities of confederation, international organization, regional

integration association, state, multilevel governance, quasi-federal polity, and cooperative federalism, nobody agrees on what exactly the European Union is. For instance, some scholars believe that the EU is a confederal system since it is a voluntary association and the member countries of the EU are free to leave the Union if they want; most citizens of the EU countries still have a higher sense of allegiance toward their national flags and national anthems; the EU institutions are weaker relative to national institutions than is the case in a conventional federal system; residents are citizens of the member states, not of the confederation; and they have a direct political relationship only with their state governments (McCormick 2015). Frederick Lister described the EU as a jumbo confederation whose members and governments continue to dominate the EU's institutions (Lister 1996). Moravcsik argued that, despite its few federal qualities, the EU is essentially a confederation of member states (Moravcsik 2007). McKay believes that we can think of the European Union as a species of federal state with some clear federal qualities and a trend over time to greater federalism (McKay 2001). Burgess argues that federal ideas have seeped into all the central institutions of the European Union, and he describes federalism as a constant reminder of a conception of Europe going well beyond mere intergovernmental cooperation (Burgess 2000). Several scholars have suggested that the EU is a hybrid system, containing features of both federalism and confederalism. While the number of federations has grown, there have been few examples in history of confederations such as Switzerland, Germany, and the United States, and none of them have ever lasted (McCormick 2015). Therefore, it is believed that the EU will end up becoming a federal system when it completes its evolution, and Tony Blair's following statements support this belief.

At one of the EU's summit meetings, Reid T. R. went up to Britain's prime minister and asked him whether these long, wordy sessions around the conference table were worthwhile. Based on Reid's description, Blair sounded bored and weary first, but then he came to life when started talking about the prospects for the EU's future. "You know, these summits makes sense if you try to have a sense of history. I mean, when the thing is getting tiresome, you have to remember what we are doing here. We are building a new world superpower. The European Union is about the projection of collective power, wealth, and influence. That collective strength makes individual nations more powerful-and it will make the EU as a whole a global power. Look, the United States is plainly the superpower of the world today, but the argument is that a single-power world is inherently unstable. I mean that's the rationale for Europe to unite. When we work together, the European Union can stand on par as a superpower and a partner with the U.S. The world needs that right now" (Reid 2004).

The following story of the blind men and elephant is a great example to understand the European Union:

> Several blind men approached an elephant and each touched the animal in an effort to discover what the beast looked like. Each blind man, however, touched a different part of the large animal, and each concluded that the elephant had the appearance of the part he had touched. Hence, the blind man who felt the animal's trunk concluded that an animal must be tall and slender, while the fellow who touched the beast's ear concluded that an elephant must be oblong and flat. Others of course reached different conclusions. The total result was that no man arrived at a very accurate description of the elephant. Yet each man had gained enough evidence from his own experience to disbelieve his fellows and to maintain a lively debate about the nature of the beast. (Puchala 1972)

With this universally known story, Donald Puchala is pointing out that nobody agrees on whether the European Union is a type of country or if it is a large and powerful international organization (EU Learning).

The European Union consists of five main institutions that were given power by twenty-eight member states in the European Union: the European Commission, European Council of Ministers, European Council, European Parliament, and European Court of Justice. On the one hand, the 28 member states of the EU are sovereign actors in the international system, with

territory, sovereignty, independence, and legitimacy. On the other hand, the member states have pooled or transferred their authority to the extent that it is no longer accurate or practical to think of them as independent political actors (McCormick 2015).

Starting with the Treaty of Paris that created the European Coal and Steel Community in 1951, the powers of the institutions of the European Union were expanded gradually. Although the European Union does not have a written constitution, it has several main treaties that empowered the Institutions of the European Union gradually. The following treaties of the EU specify the powers of the institutions and obligations of the member states: Treaty of Paris 1951, Treaty of Rome 1957, Treaty of Single European Act 1986, Treaty of Maastricht 1992, Treaty of Amsterdam 1997, Treaty of Nice 2001, and Treaty of Lisbon 2007. Before giving examples on how exactly these treaties empowered the EU and its institutions, it is crucial to understand the main structure and powers of the EU institutions.

## The Institutions of the European Union

**European Commission**: The European Commission is the executive branch and bureaucratic arm of the European Union. Its main components are the president, College of Commissioners, directorate-general and services, a network of advisory and executive committees, and the -secretariat-general. The president of the European Commission is proposed by the European Council using a qualified majority vote, and he or she must be confirmed by a majority vote in the European Parliament. The president of the European Commission is appointed by the European Council for renewable 5-year terms. Including the president of the European Commission, the College of Commissioners consists of 28 members who head the European Commission. Twenty-seven members are chosen by the president from lists submitted by governments of member states, and then the European Council either approves or rejects the final draft by a qualified majority vote. The European Parliament must also approve all nominees. The College of Commissioners serves a 5-year term, functions as a cabinet, and makes the final decisions on which proposals for new laws and policies should be sent to the European Parliament and European Council of Ministers for approval (McCormick 2008). The main powers of the European Commission are as follows:

- *Initiation*: It is the only institution tabling laws for adoption by the European Parliament and European Council of Ministers.
- *Implementation*: Together with the European Court of Justice, it ensures the correct application and implementation of EU legislation in all the EU member states (Bomberg et al. 2008).
- *Developing and managing EU budget*: It draws up annual budgets for approval by the European Parliament and European Council of Ministers, sets EU's spending priorities, and supervises how the money is spent (European Union a 2015).
- *Managing the EU's external relations*: Vets applications for full or associate membership from aspirant states and oversees the negotiation process with applicants, represents the EU in international trade negotiations, and coordinates the European Union's Official Development Assistance and Humanitarian Aid (McCormick 2008).

**European Council of Ministers**: It consists of the presidency, councils, Committee of Permanent Representatives (COREPER), working parties and committees, and the general secretariat. The European Council of Ministers is the quasi-legislative arm of the European Union, and it shares power with the European Parliament for discussing and passing EU laws. It also shares powers with the European Parliament for approving and adopting the EU budget. Since the Treaty of Maastricht in 1992 obliged the presidency of the Council of Ministers to consult with the EP on the development of the Common Foreign and Security Policy, with the consent of the European Parliament, it also concludes international agreements on behalf of the EU. Each

country of the European Union holds the presidency on a 6-month rotating basis, and the 28 members (government ministers from each EU country) under the councils constantly change depending on the policy area to be discussed (European Union b 2015).

**European Council**: It consists of 28 heads of governments of the EU member states. It is chaired by a president who is appointed by the members of the European Council for two and a half years, renewable once. The European Council meets at least four times a year and provides strategic policy direction for the EU. The European Council can be considered as a steering committee or a board of directors of the EU. It mainly discusses the broad issues and goals of the EU and leaves it to four other institutions of the European Union to work out the details. It has power to make nominations to several senior positions such as the president of the European Commission, High Representative of the Union for Foreign Affairs and Security Policy, and president of the European Central Bank. Till the Treaty of Lisbon, both the European Council of Ministers and the European Council had a presidency on a 6-month rotating basis, but the European Council is now headed by its own president (McCormick 2008).

**European Parliament**: It has the following five components: The president, Members of the - European Parliament (MEPs), the rapporteurs, the secretariat, and parliamentary committees. It is the legislative arm of the EU and shares powers with the European Council of Ministers. The European Parliament started life as a toothless, consultative body in a union with only six countries such as France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg. Today's European Parliament is directly elected by the citizens of the 28 EU member states and has a good deal of power (Noury and Roland 2002) There are 751 member in the European Parliament, and MEPs are distributed among the members states roughly in proportion to population of the EU countries, with Germany having 96 and Malta having six. Just like the European Council of Ministers, the European Parliament also has powers over legislation and the budget. It also has powers over other EU institutions such as having right to confirm or reject the European Council's nominees for president of the European Commission and High Representative of the Union for Foreign Affairs and Security Policy, approve the appointments to the College of Commissioners, and force the resignation of the College of Commissioners through a motion of censure.

**European Court of Justice**: The European Court of Justice is the judicial authority of the EU and consists of five components: The president, judges, advocates-general, General Court, and the EU Civil Service Tribunal. The court has 28 judges appointed for renewable 6-year terms of office. The president of the court is elected from among its judges for renewable 3-year terms. The court's main responsibility is to make sure that the treaties are correctly interpreted and national and European laws meet the terms and the spirit of the treaties, and the EU law is equally, fairly, and consistently applied throughout the member states. The court does this by ruling on the constitutionality of EU law, making judgments in disputes involving member states, corporations, individuals and EU institutions and giving opinions to national courts of the member states in cases where there are questions about the meaning of EU law or doubts on the interpretations of the treaties. EU law takes precedence over the national laws where the two come into conflict, but only in areas of EU Competence (McCormick 2008).

Each main Treaty of the EU has made an impact on increasing the powers of the EU and its institutions:

For instance, in its early years, the European Parliament was mainly limited to the *consultation procedure*, and it was the European Council of Ministers that had the final say over the adoption of EU laws, but the Treaty of Single European Act in 1986 changed the balance of power by introducing a new cooperation procedure that gave the EP a second reading for laws in environment, single market, regional policy, and European Social Fund. The Treaty of Maastricht (Treaty on European Union) in 1992 gave more power to the EP by extending cooperation to cover more policy areas and introducing a new *co-decision*

procedure that allowed for a third reading. The Treaty of Lisbon in 2007 renamed the co-decision procedure as ordinary legislative procedure, and this is the most common legislative procedure now used in the European Parliament. Ordinary legislative procedure gives the European Parliament and European Council of Ministers equal powers over proposals for almost all EU legislation. The Treaty of Amsterdam in 1997 also expanded the powers of the European Parliament, and EP was given the power of approval over the appointments to the College of Commissioners.

The Single European Act has given legal status to the meetings of the European Council, created a new Court of First Instance (General Court) to help the European Court of Justice with the growing legal caseload, and given more responsibility to the community over environmental policy, research and development, and regional policy. The Treaty of Maastricht has given new rights to the citizens of the EU member states and created an ambiguous citizenship allowing EU citizens to live wherever they want in the EU and to stand and vote in local and European elections. The Treaty of Amsterdam has created a new office of high representative of Common Foreign and Security Policy (CFSP), extended the EU policy responsibilities to health and consumer protection, and incorporated the Schengen Agreement into the EU treaties. The Treaty of Lisbon has allowed the members of European Council to appoint their own president, created a new office of High Representative of the Union for Foreign Affairs and Security under the European Commission, created a new formula for qualified majority voting in the European Council of Ministers, and formally recognized the freedom of a member state to leave the European Union. The Treaty of Nice has given each member state just one commissioner and left today's College of Commissioners with 28 members (McCormick 2011).

## Conclusion

Although the current EU institutions are weaker relative to the national institutions than is the case in a conventional federal system such as the USA, the EU and its institutions are definitely becoming more powerful, and each new EU treaty is taking the EU a step closer to becoming a federal system and the United States of Europe. Although the EU has become more and more supranational over time, it is still far from the point where one could talk about the irrelevance of 28 member nation states in the European Union today (Kubicek 2012). The tension between intergovernmentalism and supranationalism will continue to make an impact on the politics and power division in the European Union which is a complex system where powers and responsibilities are shared horizontally among interdependent institutions (European Commission, European Council of Ministers, European Parliament, European Council, and European Court of Justice) at the EU level and vertically between the EU and the member states (Hay and Menon 2007).

# Power and Politics: Basic Concepts

James Alexander
Department of Political Science, Bilkent University, Ankara, Turkey

## Synonyms

History of political thought; Political philosophy

## Introduction

It is no easy matter to discuss the basic concepts of politics. To do so requires both philosophical and historical reflection. Philosophical reflection considers such concepts in relation to truth; historical reflection considers them in relation to time. A basic concept of politics is one which enables us to state the problems of politics. "Liberty," "justice," "equality," "rights," and "democracy" are not basic concepts for this reason. They are the words for highly sophisticated answers proposed by some to the problems of politics. Anyone who takes any of *those* concepts to be basic is simply making a mistake.

The basic concepts of politics have been much written about in the western tradition of political thought. There are two types of basic concepts, those which clarify the questions raised by politics and those which attempt to state the answers to these questions. There are three sections in this chapter, one for the questions, one for the answers, and one for politics itself.

## The Questions

The basic questions of politics cannot be conceptualized simply. Politics is not a simple subject. So in the last century or so, these questions have come to be conceptualized in terms of six nexuses. A "nexus" is a tension between two features or elements of a human situation which can, at times, appear to be in contradiction but can be reconciled or overcome in some way or other. The six nexuses form a complete sequence taking us from a "state of nature" to the "state."

The first is the *nexus of sociability and unsociability*. Aristotle in *The Politics* thought humans were political animals, that is, naturally sociable; Hobbes in *De Cive* thought not. Both were right. Humans are, as Kant put it, characterized by *ungesellige geselligkeit*: they are "unsociably social" (Kant 1991, p. 44). We are continually coming together, to share our activities, before then departing, whether physically or imaginatively, all the while displaying and concealing our separate views of what should be done. This makes all shared human activity highly uncertain. The question is what arises when unsociably social humans try to act together sociably?

The answer is the *nexus of conflict and cooperation*. Since humans are both sociable and unsociable, when they come together there is a continual uncertainty about the nature of their

ability to do anything together and to do it for any length of time: each human reacts against others and reacts against him or herself. In this situation, while humans are together, they experience moments when their ends coincide and there is concord and moments when they do not and there is discord. At this stage "politics is the balance of conflict and co-operation between human purposes on any scale on which you care to look at it." (Dunn 2000, p. 361) But it is more than this, because the next question arises, what happens when humans come into conflict? Conflict is not, as it might be, the end of politics but one of its conditions.

The third nexus is the *nexus of coercion and consent*. The result of human conflict would be the continual threat of relapse into unsociability if it were not for this. For here humans impose their wills on each other and not only their wills but their imaginations. If I impose my will on you, in the first instance I coerce you, as if we are at war, by using force. This is a simple possibility, a fact of power. But humans are capable of understanding how they have consented to such coercion: and thus coercion becomes something other than coercion. Through consent coercion might even become concord. At this stage politics is the conversion of power, force, or violence into something else or, as Runciman puts it (2014, p. 11), "the control of violence." "What's specific to politics" – at this stage – "is the relationship over time between consensus and coercion" (p. 13). This nexus signals the end of any original condition of equality. Coercion creates inequality, after which consent enables us to justify inequality or even overcome it completely.

The fourth nexus is the *nexus of rulers and ruled*. The resolution of conflict by coercion and the subversion of coercion by consent mean that an order is established which divides a society into recognized classes, which means fundamentally into classes of rulers and ruled. A community is arranged into vertical hierarchies of classes or castes and acquires its distinctive culture and character through the mechanisms by which these hierarchies are established, sanctified, maintained, adjusted, and exploited. This is the most important of all the nexuses. It is here we find the traditional Greek constitutions of monarchy, aristocracy, and democracy. Grotius declared in the seventeenth century (1949, p. 130) that "a relationship of the parts that rule and the parts that are ruled" was the proper study of the *politicus*, or political scientist. Collingwood's remarkable *Three Laws of Politics* (1992, pp. 189–190) is the best characterization of this nexus. The first law is that "a body politic is divided into a ruling class and a ruled class"; the second law is that "the barrier between the two classes is permeable in an upward sense"; and the third law is that "there is a correspondence between ruler and ruled": the ruled are educated by the rulers so that they too can become rulers. At this stage power is no longer a mere flux dependent on sociability and unsociability operating through conflict and cooperation: it is a flux which is fixed at a center, even if only an imaginative center, and therefore a center of power emerges. Hence the fifth nexus.

The fifth nexus is the *nexus of center and periphery*. Unlike the fourth, which is vertical, this nexus is horizontal and is best understood abstractly in terms of the extension of power in space. A power is established at a center, the point at which rulers and ruled are distinguished. Maintaining, changing, and subverting vertical hierarchies consumes power, but it also unleashes greater power outward where it is used in maintaining and extending control at a distance. This power inevitably declines the further we move from the center outward to the periphery. The decay of power allows first outlaws and then other communities to exist, which are either ruled from their own centers or not ruled at all. If the previous nexus raises the question of the nature of the constitution, this nexus raises the question of how the body politic understands itself to relate to the world as a whole.

There are, formally considered, in terms of territory, three major ways in which a body politic can relate to the world. It may be a state, an empire, or a cosmopolis. If a power recognizes other equal powers and divides the territory of the world between them with the eventual acknowledgment of borders, then it will be a primitive state. The modern legal state of the last five centuries is simply this state brought into law

(Skinner 1989). It is fundamental to a state not only that it is, as Weber (1994, p. 326) put it, the possessor of the legitimate monopoly of violence within its territory but that it *recognizes* the existence of equally legitimate monopolies of violence beyond its borders (Lauterpacht 1948). Secondly, a power may refuse to recognize other powers but only its own power extended as far across the world as it can be extended, so there are no borders, and there is no recognized rival *de iure*, no matter what exists de facto. This is an empire (Münkler 2007, p. 5). Thirdly, a power may extend across the world and be recognized as justified, sublimated, existing in a total world order not by coercion but only by consent: this is – we still lack an agreed language for this – a cosmopolis. This last is perhaps unattainable, but it remains the ideal of a body politic of all humans: it is perhaps the telos of all political activity, even if impossible (Kant 1991).

The sixth nexus is the *nexus of past and future*. If the fifth nexus concerns space, this concerns time. It is simple enough. The establishment of order has a history, established in memories or canons of literature, including both continuities and discontinuities, which enables us to make sense of the past and anticipate the future. Traditions are established, forgotten, and recovered (Renaissance and Reformation) or criticized and extended (hence Enlightenment) – perhaps even invented (Hobsbawm 1983). Sometimes absolute revelations or epistemic insights convince us that we can establish fixity in the flux of time. There is no doubt that uncertainty about the relation between past and future is a major source of political anxiety. Almost all political philosophy is a meditation on the mortality of states. Even Hobbes's Leviathan, though a god, was a *mortal* god.

The discovery of these six nexuses is the achievement of Western political theory. They describe the difficulties faced by humans in attempting to create or maintain any sort of order on earth. The answers to those difficulties constitute politics. But politics is not simple. It is not one answer but a great set of contradictory answers. Four major paradigmatic concepts have emerged which enable answers to be offered to the question of politics. These paradigms are not just historical. All four still exist and still complicate everything we think about politics.

## The Answers

Of the four paradigms, or four paradigmatic concepts, in terms of which answers have been proposed to the questions thrown up by politics, the first is simple and already evident in what has been said so far. It is power. The other three are law, love, and commerce.

The four paradigms form a logical, as well as a historical, succession. Fundamentally, there is power. Law is antithetical to power, impersonal where power is personal, fixed where power is a flux. Love is the reconciliation of the two. It offers completion but perhaps only in unattainable form. So there is a fourth paradigm, an adjustment of power, so it is not merely imposed from above but discovered in human activity. Yet even this, so far from answering our questions about politics, puts them in amber, makes them eternally unanswerable. So we must consider all four paradigms.

Power is a fact of all life. All life exerts itself, strains for a "place in the sun": to somehow take some of the power of the sun, even if only indirectly. Plants exert themselves to cover the earth – they struggle for land (consider the epic struggle eight million years ago between the empire of trees and the empire of grass) – and animals struggle on the face of the earth, above it and below it, to maintain their modes of life, by conquering and consuming plants and other animals and by struggling against other animals, of the same and other species, to propagate themselves across the earth. Raymond Geuss (2008, p. 97) has recently told us: "If you want to think about politics, think first about power." But there are two ways of thinking about power. One of them is ancient, though it is still with us, and the other is modern. One is absolute, the other dialectical. The first is power in the form of power over others. Here power is a capacity belonging only to the stronger, the lord, the master, the king, the priest, the god. The second way of thinking about power sees power as everywhere, as a matter of relations and acting together, or as a capillary presence and situational

fact: not so much "power over," as "power with" or even "power throughout" – the power evident in a system (Foucault 2004). Such dialectical views are now standard; Hegel spoke of a "master–slave dialectic"; Nietzsche spoke of "slave-morality"; anthropologists now speak of "reverse dominance hierarchies." Such reversals explain why it is difficult to distinguish power from authority and influence. J. R. Lucas (1967, p. 16) distinguished them as follows: by *power*, if I say "let this happen," then it happens; by *authority*, if I say "let this happen," then it ought to happen; and by *influence*, if I say "let this happen," then others say "let this happen." This is a good formal distinction. In practice they are difficult to distinguish.

Some have returned to an absolute theory of power. The most famous theory is the one proposed by Steven Lukes (2007):

1. I have one sort of power over you if I can make a decision on your behalf.
2. I have another sort power over you if I can exclude the decision you want from the range of available options.
3. I have yet another sort of power over if I can control the means by which the decision is implemented or the conditions on which the decision depends, even if it is the decision you want.

No matter how dialectically it is understood, power of this sort remains an absolute fact. Since this is so, humans have sought to restrain it by various means. The primary means is law.

If power is a fact or a flux, then law is a frame for the fact or flux of power. The word "law" is derived from an old Teutonic word meaning "to lay something down." Law seeks fixity, stability, and security through the laying down of standards. Humans have never lived without standards, though these have not always been codified. Law brings with it subsidiary concepts like right or justice or legitimacy which are meant to stand behind any actual law, to make that law right or just or legitimate. Plato suggested a magnificent threefold about where we find law in a political order. There is:

1. A ruler who has the laws within him, is *nomos empsychos*, the spirit of the law.
2. A ruler who acknowledges laws that are outside himself.
3. A ruler who does not acknowledge laws.

Plato distinguished these in terms of knowledge. The first type of ruler has perfect knowledge, the second has imperfect knowledge formalized in law, and the third is ignorant and rules capriciously (Barker 1959, p. 175). Plato considered the second, which we would now call "the rule of law," a mere second best. But the Biblical writers, who understood how weak kings could be, considered Josiah, the king who discovered "the book of law," one of their greatest kings: and for a time suggested that on coming to power, a king should be locked away to study a copy of the law. This was a vision of politics of the second best: though the Israelites did not think of it this way, since for them the law was God's law. In the absence of God's law, it is unclear how to ground our trust in law. Is there such a thing as natural law? Or is there only positive law?

Behind these questions lies the greater question of one of the relation between law and power. Power is the realm of *is*. Law adds to *is* a beguiling second, *ought*. Power should be in accordance with law. But power is independent of and prior to law. "Naturally and thus originally *might*, not *right*, rules on earth and has the advantage over the latter of the *jus primi occupantis*. All that we can desire and demand is that it will always be on the side of, and associated with, right" (Schopenhauer 2000, Vol. 2, p. 248). Law requires a power acting on behalf of law to force all power, or all other power, to lie down with the law. As Schmitt (2015, p. 32) put it, power is a surplus. "Even in those cases where power is exercised with the full consent of all those subjected to it, it still retains a certain significance of its own, a surplus value, so to speak." Aristotle in the *Politics* could not decide whether to locate the ultimate *arche* in the *polis* in rules or a ruler. And power and law have remained the fundamental contradictory elements of politics. No one has succeeded in resolving them. Even in our time Michel Foucault and Noam Chomsky (2006)

have disagreed on the question of whether power is prior to law or law prior to power.

Justice has been a major concern of political philosophers from Socrates to Rawls. But belief in law and justice has always depended on some higher principle than the law itself. In the Bible (1 Timothy 1:9) it says, "The law is not made for a righteous man." The idea is that a righteous man, like Plato's statesmen, does not need the external imposition of law, because the law is within him because of his understanding of and sympathy with the principle of all things: in other words, because of love. This brings us to the third paradigm.

The case for love was stated in full in our tradition by Augustine (1998), who understood that Christianity had destroyed classical assumptions about politics once and for all. A *societas perfecta*, for all ancient philosophers, was one in which there was harmony, concord: a society of friends or of love, where we trusted our rulers, where we had faith in them. This trust or faith was usually lacking in practice, and the eventual verdict was that such a society could only exist by grace, by an act of God. Such a vision of political grace has almost always existed: it survived into modernity in utopias which looked forward, or in romantic visions of a golden age which looked backward, to a better society. Without such a vision, political philosophy lacks its telos, a good order or *eunomia*. According to such a vision, right is righteousness. We seek a complete harmony between man and world, and therefore all men. In religious terms this harmony is derivative. Humans can trust God and so can, by grace, by covenant, or even by imitation, trust each other. This paradigm completes the paradigm of law while not belonging to it.

This paradigm of political thought has depended on a multitude of expedients: covenants, oaths, contracts, prayers, sacrifices, priests, prophets, missionaries, and even a revolutionary vanguard. It has its own set of related concepts: faith, hope, charity, benevolence, and trust. All of these expedients were designed to make trust in other men possible. Rousseau's "general will" was the attempt to create a secular trust and was perpetuated in historicized form by Hegel into the nineteenth century where it existed to inspire Marx to his theories. It was adapted by anarchists: those who took it so far that they disavowed any dependence on God and assumed that humans by their own efforts, by imitation alone, could achieve a perfect society (Rocker 1998). Most philosophers, however, chose other paths. Their expedients – involving rights or any sort of calculus or, more practically, "democracy" (elective oligarchy in borrowed regalia) and "checks and balances" – were admissions of failure. The ideal could not be achieved: so we attempted to patch up the actual. Love was considered "not of this earth." The Catholic Church could not hold onto its claim to be a perfect society and was usurped by the state, which never pretended to be perfect. The state clothed itself in the paradigms of power and law – the languages of *Raison d'état* and *Rechtsstaat* – and finally clothed itself in the next paradigm to emerge: the commercial paradigm which was the contribution of the seventeenth and eighteenth centuries.

A political order constructed in terms of commerce is a political order constructed in terms of an adjusted theory of power. Where power formerly had always been understood to be "power over," here power is understood to be transactional, where the transaction is more significant than the status of the transactors. The revolution in consciousness which came about through the establishment of the commercial paradigm is still not understood as clearly as it should be. It is not that individuals engage in commercial transactions: it is that they fundamentally relate to each other in the manner of a commercial transaction (Hont 2015, p. 3). Without this there would have been no modernity: no enlightenment; no historical consciousness; no science of economics; no politics of gross domestic products, investment, and capital; no romanticism; no revolution; and no ideologies.

The nexus of sociability and unsociability had always caused problems for theorists. The compromise between Aristotle and Hobbes which was established by Pufendorf and taken up by Adam Smith and others was that "sociability was not an immediate and instinctive natural propensity but

rather a reciprocal transactional mechanism to repair the feeblest aspects of man's natural constitution" (Hont 2005, p. 41). It depended, as Smith (1991, p. 12) put it, on "the propensity to truck, barter, and exchange one thing for another." The commercial paradigm involves the claim that the establishment of order is an unconscious consequence of acts carried out with other purposes in mind. Passions are no longer condemned, and selfishness is no longer condemned: because, as Mandeville put it, private vices generate public virtues. Particular interests are the motive forces of universal history. This is Adam Smith's theory of the "invisible hand." Its discovery unleashed on the world a paradoxical question, the answers to which for a century or longer seemed to offer humanity answers to all the problems of existence. The question was: Until now we thought our achievements were conscious and intended. Now we know they were unconscious and unintended. But now we are conscious of *this fact* – what do we intend?

The commercial paradigm put everything in the older politics to the question. Yet modern politics has to be considered in terms of all four paradigms. Power has a very insecure hold on the future, even if it seems decisive in the present. Law offers more hold on the future, since it is static, fixed. Love offers security for this rather impersonal law yet also makes it secondary and perhaps seeks a perfection not to be found in politics. And the final hope is that the unconscious activity of humans engaged in commerce in search of their own satisfactions might by some invisible hand generate not only the order we seek but also that continued order we hope for. This is the hope of the enlightened modernity of the last few centuries, in which we still exist. After Hume and Smith, there was the French Revolution and Burke and Marx, and after the long nineteenth century of Bentham and Mill and other optimists, there was the First World War and all the fractured consciousness and modernism and skepticism of Heidegger, Barth, Oakeshott, Gramsci, Schmitt, and many others. The questions of politics are still open.

What is politics in particular?

## Politics

Politics, for Aristotle, was the word for the activity appropriate to the polis and also the activity of understanding the polis. Aristotle understood all too well that this science was an object of study which at any time could exercise control of the scientists conducting that study. He said at the beginning of the *Nicomachean Ethics* (1934, p. 5) that politics was the *ruling* science, "for it is [the science] that ordains which of the sciences are to exist in states." Interestingly, the word "politics" in medieval Europe always had a positive meaning: it was only used to describe the good order. For many, like Thomas Aquinas, politics was only found in republics, not monarchies. From the fifteenth century, some writers applied political language to monarchies (Rubinstein 1987). And then came what Maurizio Viroli has called "the revolution in the concept of politics":

> Before the revolution, the word politics had only a positive connotation. Afterwards, it acquired, for the most part, only a negative connotation. Having enjoyed for three centuries the status of the noblest human science, politics emerged from the revolution as an ignoble, depraved, and sordid activity: it was not longer the most powerful means of fighting oppression and corruption but the art of perpetuating them. (Viroli 1992, p. 477)

This shift is now associated with Machiavelli. But Machiavelli kept apart his reflections on how a prince should control the state from his reflections on good order. Careful readers of Machiavelli, like Bodin, Harrington, and, later, Arendt, saw that Machiavelli had wanted to restore classical political science. But things were no longer so simple: the light and dark were henceforth mixed. Harrington (1992, p. 8) had distinguished "ancient prudence" from "modern prudence": the former was "an art whereby a civil society of men is instituted and preserved upon the foundation of common right or interest," and the latter was "an art whereby some man, or some few men, subject a city or a nation, and rule it according to his or their private interest." But now both are part of politics.

Between the seventeenth and nineteenth centuries, the master concept of politics was "the

state." But since the late nineteenth century, political theorists have tried to define politics (or "the political") apart from the concept of the state. The most impressive of these are Schmitt ([1932] 1996), Collingwood ([1942] 1992), Arendt (1958), Oakeshott (1975), and Rancière (1999). Their definitions are so contradictory that there is reason to think that thinking about politics should now begin with reflecting on the contradictions between them (Alexander 2014). For instance, Arendt and Rancière begin with the singular view that "politics" cannot be associated with rule. The problem is that all major political philosophers from Aristotle through Hobbes to Hegel have understood that "politics is inherently concerned with rule" (Dunn 2000, p. 15). If we cannot ignore Arendt and Rancière, it is because politics is obviously much more than rule and is sometimes "much more" in a way which can seem antithetical to rule.

At the beginning of the twenty-first century, it seems that politics has a variety of meanings, which can be arranged in a scale of forms as follows:

1. Politics is, most simply conceived, rule.
   *But it is difficult to maintain the fixity of rule in a changing world, so*:
2. Politics, at a higher level of complexity, is the maintenance of rule by rulers in a changing world.
   *But it is not only rulers who disagree about how to do this; the ruled also disagree about it; and it is possible for disagreement to be incorporated into the system, so*:
3. Politics, at an even higher level of complexity, is the maintenance, adjustment, and subversion of rule, as well as deliberation about rule, by those who are in dispute about it.
   *But politics is not only a practical matter of dispute, it is also a theoretical matter of conceptualization, so*:
4. Politics, at the highest level of complexity, is the critical understanding or science of the maintenance, adjustment, and subversion of rule by those who are in dispute about it.
   *Where politics is understood in terms not only of time but of truth*.

## Conclusion

Politics is complicated by the six questions (nexuses) and four answers (paradigms). It is torn between an ancient prudence which values the common good and a modern prudence which values the individual good. It is very often a matter of "irrelevance, inadvertence and ambition" (Cowling 1963, p. 187). Yet it is also sometimes a matter of the highest ideals. This is why we may well agree with Mr. Pickwick, who said, in the fifteenth chapter of the *Pickwick Papers*, to a curious and studious foreigner, that "the word politics, Sir, comprises, in itself, a difficult study of no inconsiderable magnitude."

## Power Elites

Niilo Kauppi[1] and Mikael Rask Madsen[2]
[1]University of Jyväskylä, Jyväskylä, Finland
[2]iCourts, Centre of Excellence for International Courts, University of Copenhagen, Copenhagen K, Denmark

Sociologists have taken an interest in elites since the discipline started to take form in the nineteenth century. Alexis de Tocqueville's explorations of the formation of the United States and modern society clearly highlighted the key role played by legal professionals in this process and how they offered an important alternative to the landed elites who still dominated in Europe (Tocqueville 1842). Half a century later, Max Weber explored modern society by highlighting how the bureaucratization of the state via legal rationalization created a professional corps of jurists who effectively exercised (delegated) state power (Weber 1978). Moreover, the modern state and society developed a professionalization of politics which challenged other, previously established, forms of power and domination. Both authors were however very much aware that there was no complete transformation from older forms of power to a meritocratic and democratic society and its agency.

This tension between traditional elites (broadly speaking) and modern meritocratic and professional elites such as lawyers and economists remains central to understanding contemporary processes of globalization and the formation of power elites (Kauppi and Madsen 2013a, 2014). Scholars have shown how an often ambiguous combination of transnational professionals and more traditional powerholders (supranational capitalists, hegemonic states, etc.) not only dominate international affairs but also largely define the very territory of what is typically referred to as the international. This challenges more formalist ideas of the delineation of the international sphere and its agency by situating processes of internationalization as prolongations of the struggles over power and domination which characterize the national level (Dezalay and Madsen 2009). The dichotomy between the national and the international is largely erased, and most of the processes in question are indeed more transnational in scope, that is, encompassing several national and international spaces – and so are the elites in question: They are global in outlook, and their actions help produce global fields. They are, in the words of Jeffrey Jackson, *globalizers* (Jackson 2005).

Following Tocqueville and Weber, elites are as a select group of agency that can be defined as

This chapter in large part reprints the analysis in Kauppi, N. and M. R. Madsen (2016). Global Elites. *Routledge Handbook of International Political Sociology*. X. Guillaume and P. Bilgin. London, Routledge.

elites by virtue of them being superior in terms of competence (knowledge and know-how) and/or because they enjoy a superior status (socially, economically, or intellectually). Elites are in other words either *relatively* defined (they are superior to the rest of their group) or *materially* defined (they possess more of a given (material or symbolic) asset than others). Importantly, they are in both cases in a position to exercise significant power with regard to global processes – and more power than nonelites. Approaching elites this way helps capture, for example, both transnational capitalists and transnational professionals under the same overarching notion of global (power) elites. This is important as to avoid distinguishing too sharply between new transnational professional elites and what could be defined as old more traditional international elites. The first reason for this is that these groups in some cases are interchangeable and often tacitly use the different professional and social venues they have access to (Dezalay 2004). The second reason is that research into global power elites should not limit itself to an extension of the sociology of professions. Instead, it should be concerned with the sociological properties of these groupings with the goal of explaining the political and social consequences of their rise to dominance for the broader social and political figurations of emerging global society.

## Theories of Global Elites

This way of delineating elites differs from most studies in the area. In a previous study, we coined the notion of *transnational power elites* with the goal of identifying our object as the agents of new forms of power and global change triggered by powerful transnational agency (Kauppi and Madsen 2013b). Thereby we sought to remedy what we saw as a flaw in existing literature which primarily has described global elites by emphasizing how they are denationalizing themselves. Samuel Huntington's "Davos Man" is one example of the latter. In his account, global elites are above all posing a threat to the coherence of the State, in his case the "American creed" (Huntington 2005). More recently, David Rothkopf has gone further and analyzed what he terms the global "superclass" (Rothkopf 2008). This new power elite, he estimates, has some 6000 members who are all defined by the fact that their connections to one another are more important than their connections to their home countries. Following this definition, the Pope and leading global terrorists are all members of the same global "superclass." Using a less glossy vocabulary and drawing on more substantiated theory, in this case global system theory and Marxism, Leslie Sklair's *The Transnational Capitalist Class* provides a striking account of a social group and structure which seeks to further the interest of global capital in ways no nation-state – or other social group – does or could possibly imagine (Sklair 2001). Sklair insists on the fact that this transnational social group is a class when defined in respect to the means of production and distribution. It is capitalist because it owns or controls – individually or collectively – the means of production. Thus, a transnational capitalist class is sustained by its interlocked agencies, ranking from business, bureaucracy, and professions – or, as we suggest by drawing on Mills, by a complex of interrelated transnational power elites.

A related sociological study is found in an analysis of development workers entitled *The Globalizers* (Jackson 2005). In his analysis of three decades of state building in Honduras, Jeffrey T. Jackson shows how the development community functions as a close-knit network of state building assistants who themselves have become policy makers. They clearly have in common with the "Davos Men," the global "superclass," and the "transnational capitalist class" in some traits of an epistemic community – they share international beliefs and goals within their community. Such a view ultimately draws on Peter M. Haas' seminal work on epistemic communities (Haas 1992). What makes the community particular is its episteme, that is, its adherence to a certain set of values and modes of validity. One might question whether the transnational capitalist superclass of "Davos Men" is as much an epistemic community as that of development workers. What is certain, however, is that they are all globalizers.

The question we raise is however whether global elites can simply be understood in terms of denationalized globalizers as suggested particularly by Huntington and Rothkopf. In a way, these approaches seem to primarily add an elite component to existing theories and ideas of global civil society or cosmopolitanism. The approach we suggest has more in common with Sklair's approach. However, we reject the strong global system perspective, as well as we moderate the Marxist metaphors. In practice, our approach is closer to the work of Yves Dezalay and Bryant Garth (2002). Whereas Dezalay and Garth might at first glance be seen as protagonists of the view of global elites as denationalizing elites, at closer examination, the "legal cosmocrats" they have studied in diverse settings and subject areas – politics, economics and human rights – are closely connected to national structures. Pierre Bourdieu, when commenting on the earlier work of Dezalay and Garth on international commercial arbitration, wrapped it up nicely: "Since lawyers and others are trained nationally, and for the most part they make their careers nationally, it is not surprising that they seek as a matter of course to deploy their ways of thinking and practicing in the construction of international institutions" (Bourdieu 1996a). In a similar fashion, global elites, like their historic national counterparts, are neither entirely international nor national but rather transnational and relying, to varying degrees, on both national and international resources and capitals. It is for these precise reasons they are often in a key position to impact globalization.

## The Global Power Elites

Emphasizing how global elites move and influence globalization raises the question of what is power. Power, of course, is by no means a clear-cut social scientific concept and necessarily has to be understood in multiple ways and combinations when analyzing global elites: as expert power, cultural power, network power, economic power, etc. Power is a relational social resource (Dahl 1961) that some individuals and groups have access to or that some groups and individuals have the right to use in specific ways following often implicit and informal conventions and rules (Bourdieu 1996b). These resources are all linked to mechanisms of recognition of their value. They consist of a variety of different types, from the most codified like collective organizational assets tied to organizational structures and division of labor or of financial means to more nebulous varieties of symbolic power (Kauppi 2005). Since global elites come in different forms – from experts to financial dynasties – very different forms of power are being exercised by these agents.

Expert power refers to the technical and political role of individuals and groups involved in the formulation and implementation of global policies. Cultural power refers to the models of organization that shape institution building (Meyer et al. 1997). Through institutional isomorphism, the same institutional patterns and modes of decision are being adopted and adapted in very different social and economic contexts. Network power, for its part, refers to the global networks of individuals and organizations in which resources are embedded. These include family networks as well as epistemic cultures that unite professional groups sharing a common interest. Finally economic power refers to the financial muscle of certain groups. Power evolves in all these different networks and spaces where diverse types of agents operate. For this reason, it is important to briefly examine the social scientific theories that seek to define more generally what kinds of groups global (power) elites are and what kinds of social resources they have access to and deploy.

As already indicated, scholars however disagree on who elites are. According to the pluralist theory expounded by, for instance, Talcott Parsons and Robert Dahl, social power (polyarchy) is dispersed and divided. The development of society is determined by democratic competition between a variety of elites, economic elites, trade unions, churches, and so on. The outcome of this competition will be equilibrium between these different interests that share a certain conception

of the political game. While this perspective takes into account the variety of interests, it paints a rather harmonious picture of political life. Joseph Schumpeter's 1950 concept of democratic elitism however seeks to unite the analysis of power with that of democratic principles (Schumpeter 2013). Democracy has evolved from a system of direct popular government into a system of competition between elites for the control of the state. As in the pluralist perspective, this theory reflects the situation in the United States, excluding from analysis the private sector and legitimizing the status quo. But in contrast to the polyarchy perspective, it introduces classes and inequality in the analysis of politics and ultimately law.

The dimension of class is even more present in elite theories that underline the concentration of power and social resources in the hands of a few who are then independent of ordinary citizens. In the classical elite theories of Pareto, Mosca, and Michels, psychological differences distinguish the elites from the masses: the elites are, so to speak, more intelligent. Elite formation is a functional necessity. Organizational complexity requires a leader. Power is situated in the key political and economic institutions of a given society. Following Michels, every organization is by definition elitist: it requires specialized personnel, usage of specialized structures by the leaders, and specific psychological attributes (charisma). In Max Weber's theory of bureaucracy, the state has a quasi-autonomous role in society. Weber understands power as the capacity to realize one's will even if others oppose it. The state has the monopoly of expertise, but contrary to Michels and his iron law of oligarchy, the state is not totally autonomous. Rather, the state is tied in a multitude of ways to society's socioeconomic structures. More recent elite theories include that of C. Wright Mills, particularly his landmark study on the American power elite. In contrast to Weber's individualistic conception of power, for Mills power was essentially institutional, for instance, military, political, or economic (Wright Mills 1956). C. Wright Mills defined the elites as being composed of upper middle class individuals. Powerless, the masses are conversely manipulated and exploited. Another American sociologist, William Domhoff, sought to fuse theories of class together with theories of power elites. A superior class that controlled the large enterprises governed the United States (Domhoff 1970). The governing class was an American business aristocracy. French sociologist Pierre Bourdieu has developed this idea of dominant elites in his numerous works on French society (Bourdieu 1996b).

While these studies show the mechanisms by which some groups of individuals succeed in staying in power, they tend to minimize the importance of electoral politics and public opinion. The complexity of society is further simplified to an extreme, as being composed of dominant or dominated classes. In revealing the mechanisms of institutional power, most of these approaches create an impression of inevitability: the elites are unified, and the relationships they entertain with the masses are unchanging. Compared to pluralist and power elite theories of elites, Marxist theories however underline the links between the economic system and the political system. Those who control the means of production govern society. According to Ralph Miliband, economical dominance tends to instrumentalize political power to further its own ends (Miliband 1982). Political conflicts are conceptualized in terms of class conflict, and the dominant classes form the ideas that make up the conscience of the masses.

## Conclusion

All these theories of power and elites attempt to answer one major question: how does the unequal distribution of resources between types of elites and elites and masses affect democracy – and society? Except for some forms of Marxist theorizing, answers have been sought at the level of the nation-state. The challenge today is to further develop both theoretically and empirically approaches that concentrate on power but this time in a much broader context. Inequalities are produced at the global level and competition for institutional political power cannot be confined to nation-states.

# Power Politics in the Governance of Bengal Sultanate

Md. Shariful Islam
Institute of Business Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Bengal Sultanate: Sultanate of Bengal, medieval period of Bengal, medieval Bengal; Ghiyath al Din Azam Shah: Ghiyas-ud-Din Azam; Muslim scholar: Shaikh, religious leader

## Introduction

Many of historical events of medieval period of Bengal remains disputed among modern scholars because of lack of contemporary commentary from Bengal. What we know about Bengal today are based mostly on numismatic evidences and stone inscriptions. Commentaries of contemporary foreign historians and travelers also have been used as reference. Most quoted contemporary commentaries that have descriptions about Bengal are Ain-i-Akbari, Tabaqat-i-Akbari, Tarikh-i-Firishta, and travel of Ibn Battuta (Ali 1985; Sarkar 1948). But in those sources, Bengal came as a short reference when there was an incidence of Delhi or other sultanates with Bengal or when the respective traveler had a visit to Bengal. Therefore, those historical records cover a very small part of the whole history of medieval period of Bengal. Reaz-us-Salatin by Salim (1788) is considered as the first comprehensive text on the history of Bengal sultanate that broadly covers medieval period of

Bengal. But still Reaz-us-Salatin was not as complete as it was required. That was caused by very small number of numismatic evidences and stone inscriptions available at hand to Salim (1788) when he wrote his said book. That also resulted into controversies among modern scholars that has been discussed later in this chapter. Further discovery solved many, not all, of those controversial issues. Therefore, numismatic evidences and stone inscriptions have played a vital role in the process of construction and reconstruction of the history of medieval period of Bengal.

A controversial character of that time in Bengal is Raja Ganesh who was a Hindu in religion. In a crucial period of Bengal sultanate, Raja Ganesh wanted to seize power of Bengal from Muslim rulers. Later he had to convert his son to Muslim which has an implication to governance in Bengal sultanate. Current chapter presents this extraordinary but controversial event in the history of Bengal. This part of history of Bengal remains enigmatic as modern historians are divided in presenting the role of Raja Ganesh in change in power of Bengal during his time. A group presents him as wicked, while another group depicts him as a clean character. Here also history of Bengal depends on numismatic evidences and stone inscriptions. This chapter covers the period of usurpation of Raja Ganesh from Muslim sultans where commentaries of historians have been moderated by available numismatic evidences.

## Early Muslim Rulers of Bengal

The Muslim conquest of Bengal dates back to the beginning of the thirteenth century. In the year 1201 AD/597 AH, a troop of 19 soldiers of Malik Ikhtiyar al Din Muhammad Bakhtiyar Khilji attacked suddenly and captured Nudia palace (West Bengal) of King Rai Lakshman Sen, a Hindu ruler of Bengal from Sen Dynasty. Bakhtyar Khalzi completed his conquest of the Varendra, which was one of the ten administrative divisions of Bengal, with the historic city of Gaur (East Bengal) during 1204 AD/600 AH. After the assassination of Bakhtyar Khalzi in August of the year 1206 AD/601 AH, Bengal was dividedly ruled by several Muslim rulers. Coins of Bengal reveal two sultans, one from East Bengal (Fakhr al Din Mubarak Shah, 1334–1349 AD/734–750 AH) and the other from West Bengal (Ala al Din Ali Shah, 1339–1345 AD/740–746 AH), simultaneously at almost same time showing a divided Bengal. It was Shams al Din Ilyas Shah (1342–1357 AD/743–758 AH) who successfully unified East Bengal and West Bengal and became sultan of unified Bengal (Bangala) that included Sonargaon, Satgaon, and Lakhnauti. He is regarded as the first independent Muslim ruler in Bengal sultanate. Reign of Ilyas Shahi dynasty took place in two periods. First reign continued until 1414 AD/817 AH. Shams al Din Ilyas Shah was succeeded by his son Sikandar bin Ilyas (1357–1389 AD/758–792 AH), grandson Ghiyath al Din Azam Shah (1389–1410 AD/792–813 AH), and grand grandson Saif al Din Hamza Shah (1410–1412 AD/813–815 AH). After Hamza Shah, Bengal sultanate saw a political crisis that was led by a Hindu usurper known as Raja Ganesh, as claimed by contemporary and modern historical records.

## Political Rise of Hindu Raja in Muslim Bengal

According to Reaz-us-Salatin (Salim 1788), Raja Ganesh conspired in killing Ghiyath al Din Azam Shah. His able minister Khan-i-Jahan Yahya was also murdered shortly after the death of the sultan Ghiyath al Din Azam Shah, which brought Raja Ganesh in the forefront of the struggle of power (Ali 1985). That may also indicate that there might be active role of Raja Ganesh in the killing of Khan-i-Jahan. After the death of Ghiyath al Din Azam Shah, his son Saif al Din Hamza Shah (1410–1412 AD/813–815 AH) was murdered followed by the killing of usurper Shihab al Din Bayazid Shah (1412–1414 AD/815–817 AH), who was a slave of Hamza Shah, and Bayazid's son Ala al Din Firuz Shah (1414 AD/817 AH) who wanted to overpower Raja Ganesh in the struggle of power in Bengal sultanate. According to historians of Bengal sultanate, Raja Ganesh had a role in conspiring all these subsequent murders (Ali 1985; Salim 1788).

Though it was assumed that Raja Ganesh ensured full control after Ala al Din Firuz Shah, it was evident from the analysis of a few coins of Qutb al Din Azam Shah and a single specimen of coin of Siraj al Din Sikandar Shah that struggle of power was continued between Raja Ganesh and other contestants even after the death of Ala al Din Firuz Shah. It is observed from coins in the catalogue of Goron and Goenka (2001) and from personal collections of different collectors that the *al musta'in billah wa'al musta'an* legend has been used in the coins of only three rulers of Bengal such as Qutb al Din Azam Shah, Siraj al Din Sikandar Shah, and Ghiyath al Din Nusrat Shah. Coins of Ghiyath al Din Nusrat Shah bear date 837 AH (1432/1433 AD), while the coins of Qutb al Din Azam Shah (Coin 1) and Siraj al Din Sikandar Shah (Coin 2) do not bear date.

**Reverse**: *al musta'sim billah nasir amir al-mu'minin khallada mulkahu*

**Power Politics in the Governance of Bengal Sultanate, Coin 2** Image of coin of Siraj al Din Sikandar Shah

Year 837 AH (1432/1433 AD) is also a year of political conflict in the history of Bengal sultanate when the power of Bengal went back to the descendant of Ilyas Shah, Nasir al Din Mahmud Shah (832 AH/1427 AD and 837–864 AH/1433/4–1459 AD) from the family of Raja Ganesh. But the type of coins of Siraj al Din Sikandar Shah and Qutb al Din Azam Shah is different than that of Ghiyath al Din Nusrat Shah and also they don't have dates. Therefore, the coins of Siraj al Din Sikandar Shah and Qutb al Din Azam Shah have been placed in the time of usurpation of Raja Ganesh by present scholars (Karim 2012; Nasir and Islam 2014). According to Karim (2012), Qutb al Din Azam Shah was a contestant of Bengal sultanate during 1412/13 AD or 815 AH to 1415/16 AD or 819 AH. The same author also anticipates that Qutb al Din Azam Shah was a minister of Ghiyath al Din Azam Shah. After the murder of Hamza Shah, he fled to East Bengal and revolted in some times against conspiracy of Raja Ganesh. As there was no other evidence of survival of Qutb al Din Azam Shah as Sultan of Bengal and because of rarity of his coins, it is presumed that this contestant of Bengal sultanate was later killed by Raja Ganesh. On the other hand, Nasir and Islam (2014) concluded that Siraj al Din Sikandar Shah whose name was found in Reaz-us-Salatin (Salim 1788) as an appointed chief judge (Qazi) in the court of Ghiyath al Din Azam Shah fled to East Bengal after Raja Ganesh dethroned Hamza Shah and later rebelled against Shihab al Din Bayazid Shah or Raja Ganesh. Similar to the fate of Qutb al Din Azam Shah, it can be presumed that the rebellion of Siraj al Din Sikandar Shah also ended up as a failure and he was also killed by Raja Ganesh or Shihab al Din Bayazid Shah. Later, as it has been said earlier, Raja Ganesh killed Shihab al Din Bayazid Shah and his son Ala al Din Firuz Shah. Probably after all these, Raja Ganesh finally got ultimate supremacy in Bengal.

## Trade-Off of Religion for Power

After securing his power in Bengal, Raja Ganesh continued elimination and persecution upon the

Muslims (Ali 1985). According to Reaz-us-Salatin (Salim 1788), Raja Ganesh continued oppression over and bloodshed of Muslims to make his power more secured. He killed many Muslims and Sufis or scholars of that time. Muslim scholar Shaikh Badr al Islam and his son Farid al Islam were killed by Raja Ganesh as they persistently refused to acknowledge his supremacy in Bengal (Ali 1985; Blochmann 1968; Salim 1788). It is claimed that Raja Ganesh conspired to kill a large number of Muslim scholars by ordering the drowning of a boat where Muslim scholars were on board (Blochmann 1968; Salim 1788). He also demolished mosques and massacred Islamic establishments.

All these oppressions by Raja Ganesh led Nur Qutb al Alam, the leading Muslim scholar (Shaikh) of the time, to invite neighboring Jaunpur sultan, Ibrahim Shah Sharqi, to invade Bengal. As Raja Ganesh was facing opposition of Muslims from inside Bengal, he did not have the strength or courage enough to fight against Jaunpur sultan. According to Sarkar (1948), the invaders, on the other hand, who came from dry land could not maintain their hold or keep their force fit in the wet climate of Bengal as monsoon started. Finally a truce was reached after Raja Ganesh submitted to Nur Qutb al Alam. Shaikh took this opportunity and agreed to accept proposal of truce on the condition of his conversion to Islam. Raja Ganesh saved his religion by offering his elder son, Jatmal Jadu, to convert to Islam and enthroning him as sultan of Bengal. Nur Qutb al Alam accepted this proposal, converted Jadu to Islam, and gave him a Muslim name Jalal al Din Muhammad Shah (Blochmann 1968). After that Jalal al Din Muhammad Shah was placed on the throne of Bengal sultanate (1415–1416 AD/818–819 AH as first reign) as was negotiated between the two parties. On this event, Ibrahim Shah of Jaunpur Sultanate ordered withdrawal of his force from the border of Bengal. Coin 3 is a numismatic evidence of the first year (818 AH/1415 AD) of first reign of Jalal al Din Muhammad Shah. On the reverse of the coin, Jalal al Din Muhammad declares him as *nasir al Islam wa'al muslimin*, translated as *the helper of Islam and the Muslims*.

**Obverse**: *Jalal al dunya wa'al din abul muzaffar Muhammad Shah al sultan*

**Reverse**: *nasir al Islam wa'al muslimin Khallada mulkahu*
Date 818 (٨١٨) AH on margin

**Power Politics in the Governance of Bengal Sultanate, Coin 3** Image of coin of Jalal al Din Muhammad Shah

Nur Qutb al Alam died in 1416 AD/819 AH. Raja Ganesh was probably waiting for this time, and he immediately dethroned his son Jalal al Din Muhammad Shah and declared himself as Raja of Bengal taking the title *shri shri Danuja Mardana Deva*. Raja Ganesh again started repression over Muslims. This time the oppression of Raja Ganesh reached to the climax. Blochmann (1968) mentioned Raja Ganesh's reign as "the oppressive rule" and dubbed him as a "monster." Raja Ganesh arrested and later killed Shaikh Anwar, son of Nur Qutb al Alam (Ali 1985; Blochmann 1968). He ruled Bengal from 1416 AD/819 AH to 1418 AD/821 AH (Saka 1339–1340) and introduced a new series of coins with Bengali inscriptions. He replaced Islamic religious legends with Hindu religious legends. In addition to this, he introduced Sakabda dates on his coins replacing Hijri calendar dates. Coin 4 is an example of coins issued by Raja Ganesh.

As said earlier, on his coins Raja Ganesh took the title *Danuja Marddana Deva*. On the obverse of the coin at the center within a multifoil, the Bangla inscriptions have been read as *shri shri danuja marddana deva*. On the reverse of the coin, Raja Ganesh introduced religious legends showing respect to Shri Chandi, a name of Hindu goddess Durga. The inscriptions at the center of this coin have been read as *shri chandi charana parayana* that has been translated as *obedience to the feet of Shri Chandi*. Margin of

the reverse bears the date and mint of the coin. The mint is not on the flan and so not readable. But the date on this coin is read as 1339 (Sakabda). Raja Ganesh died in 1418 AD/821 AH. According to the statement of a few historians, he was killed by officers of his son Jalal al Din Muhammad Shah (Ali 1985; Blochmann 1968).

After the death of Raja Ganesh in 1418 AD/821 AH, his younger Hindu son Mahendra Deva became Raja of Bengal for a short period of time (1418 AD/821 AH/Saka 1340). His coins (Coin 5) continued to bear the same Hindu legends as introduced by his father Raja Ganesh. He was later dethroned by supporters of his elder Muslim brother Jalal al Din Muhammad Shah who was enthroned to Bengal Sultanate for the second time after this event in 1418 AD/821 AH. The second reign of Jalal al Din Muhammad Shah brought into stability in Bengal Sultanate which lasted for a significantly longer period of time. He ruled Bengal till 1432/33 AD/837 AH. Shams al Din Ahmad Shah (1432/33 AD/837 AH), a son of Jalal al Din Muhammad Shah, was the last sultan from successors of Raja Ganesh. Coin 6 is an example of coins of Jalal al Din Muhammad Shah of the first year (1418 AD/821 AH) of his second reign. Coin 6 bears the same title of the sultan and legends as it was in Coin 3 of first reign.

It is claimed that Ganesha after becoming Raja of Bengal wanted to convert Jalal al Din Muhammad back to Hindu religion (Blochmann 1968; Salim 1788). But numismatic evidences reveal that his effort was not successful. From Coin 6 it is evident that in the first year of his second reign Jalal al Din Muhammad Shah declares him as *nasir al Islam wa'al muslimin*, the helper of Islam and the Muslims. As stronger evidence, the reverse of a few types of his coins bear kalima-i-shahada, which is the foundation of Islam. Coin 7 is one of such examples.

Year 1421 AD/826 AH falls in his second reign. On this type of coins, the inclusion of kalima-i-shahada indicates that Jalal al Din Muhammad Shah was converted to Islam wholeheartedly. Another evidence of this argument is that his son's name was Shams al Din Ahmad Shah, indicating that he was also a Muslim. Ahmad's coins also bear kalima-i-shahada. Coin 8 is one of the examples of coins of Shams al Din Ahmad Shah with kalima-i-shahada on the reverse.

## Reconstruction of Ganesha's History by Sarkar (1948)

Sarkar (1948, pp. 125–128), a modern historian of Bengal, offers a "modern reconstruction of the history of Ganesha and his sons" where he rejects most of the claims made by Salim (1788) by calling them as "pious frauds." According to Sarkar (1948), Raja Ganesh was "a baron of Dinajpur." His ability, experience, and material resources helped him to become the most powerful man in the court of Ghiyath al Din Azam Shah. These also made him natural de facto ruler of Bengal after Ghiyath al Din Azam Shah. He set Saif al Din Hamza Shah, a minor prince, to throne as a puppet of him. Raja Ganesh did it in concert with certain widow queen. This led other dowager queens and disappointed nobles in plotting against Raja Ganesh that ended up in a civil war. At this stage the puppet king was somehow lured into rising against the force of Raja Ganesh but later was killed.

When Ala al Din Firuz Shah was assassinated by regent of Raja Ganesh, the latter assumed the crown himself. According to Sarkar (1948), this led Islamic theologians and "unruly and ambitious" Shaiks to invite Ibrahim Shah Sharqi, the sultan of Jaunpur, to invade Bengal. Later a truce was reached, the Jaunpur force went back "for a money consideration," but Raja Ganesh converted his son "Jadusen" to Islam to make him sultan of Bengal.

Sarkar (1948, p. 127) disagrees with the claim of Salim (1788) that Raja Ganesh attempted to uproot Muslim scholars instead claiming that he tried to "reduce the overgrown and unruly Muslim monastic orders to obedience and to squeeze out of them a portion of vast treasures they had accumulated by beguiling sultan Ghiyas-ud-din Azam in his old age. . . ." He adds that Ganesha was not murdered by his son Jalal al Din Muhammad. Instead he died peacefully in his old age. Sarkar (1948) also turns down possibility of any civil war between Jalal al Din Muhammad and his younger Hindu brother, Mahendra Deva, who succeeded his father for a short reign.

## Criticism of Sarkar's "Reconstruction" by Ali (1985)

Ali (1985) criticizes Sarkar's (1948) "modern reconstruction of the history of Ganesh and his sons" by calling it as "attempted apologies for the Raja" based on Sarkar's "historical imagination." Ali (1985) calls Raja Ganesh's natural position of de facto ruler after Ghiyath al Din Azam Shah simply because of the weakness of infant rulers, which has been claimed by Sarkar (1948) as "obviously far too much of an apology for him." According to Ali (1985, p. 156), "all the extant sources rather show clearly that he came to occupy the position which he did by clever machinations resulting in a series of murders." He also questions source of claim made by Sarkar of Ganesha's having recourse to bribery that led Jaunpur sultan to withdraw troops from Bengal.

Ali (1985) also criticizes Sarkar's (1948) claim that Raja Ganesh died peacefully in old age and was not murdered by his son Jalal al Din Muhammad as Sarkar (1948) indicates this as piously imagined event by Salim (1788) on the "gossip of some" (ba qaul-i-ba'ze). Ali (1985) introduces contemporary historian Al-Asqalani (in Habashi, 1971) who unequivocally mentioned that Jalal al Din Muhammad Shah revolted against his father Raja Ganesh and killed him. Hence Ali (1985) instead claims that Sarkar's (1948) indication was his "pious imagination" instead. Further, Ali (1985) also criticizes Sarkar's (1948) effort to hide Ganesha's oppressions over Muslim scholars as claimed by Salim (1788) by calling it as Sarkar's (1948) "labored apology" for Raja Ganesh.

## Conclusion

There is disagreement with the conspiracy theory, developed based on the commentary of Salim (1788), of Raja Ganesh against Ghiyath al Din Azam Shah and his successors. There is disagreement also on how Raja Ganesh died. But there is no controversy on the fact that Raja Ganesh agreed to convert his elder son Jadu to Islam who was later given a Muslim name Jalal al Din Muhammad Shah. Historians also agree on the role played by Nur Qutb al Alam, a Muslim religious leader, in power politics of Bengal Sultanate. There is also no disagreement among historians that Jalal al Din Muhammad Shah came back in his second reign as a Muslim ruler. Contemporary coins of Bengal act as a series of evidence of the agreed events in the history of Bengal.

It is true that numismatic evidences do not tell anything about how Raja Ganesh died or whether the sultan of Jaunpur went back in money consideration or not. But two recently identified sultans of Bengal, Qutb al Din Azam Shah and Siraj al Din Sikandar Shah, who have been placed by modern numismatists in the crucial period of usurpation of Raja Ganesh, indicate a series of conflict between Raja Ganesh and contemporary Muslim leaders who struggled for power against each other. Contemporary Muslim leaders challenged usurpation of Raja Ganesh, while the latter ultimately defeated them to establish himself as supreme power of Bengal. It has also been observed from numismatic evidences that Jalal al Din Muhammad Shah did not hesitate in discarding trend of coins that carry Hindu images, which was introduced by his father and reinstating Islamic coins in Bengal. This move of Jalal al Din Muhammad Shah indicates sign of no respect for his Hindu father. After the death of Raja Ganesh, enthronement of his younger son Mahendra Deva instead of elder son Jalal al Din Muhammad Shah puts a question mark on the claim of Sarkar (1948) that there was no conflict of power among sons of Raja Ganesh. The short reign of Mahendra Deva, rarity of his coins, and continuation of Hindu legends on his coins that were introduced by his father in contrast to Islamic coins of Jalal al Din Muhammad Shah indicate conflict of power between siblings of two religious beliefs.

In conclusion it is evident that Raja Ganesh wanted to establish him and his family in the power of Bengal. He also wanted to uphold his religious belief, Hinduism, over Islam. Raja Ganesh challenged sultans of Ilyas Shahi family, while afterward was challenged by Muslim religious leaders of Bengal. Raja Ganesh successfully placed him and his family in power of Bengal by outperforming Ilyas Shahi family. But he was defeated at the prudence of religious leader Nur Qutb al Alam, who above all wanted supremacy of Islam in Bengal. Raja Ganesh established his family in power, but Nur Qutb al Alam at that time saved Islam in Bengal.

# PPPs and SDGs, the Missing Stakeholder Is Civil Society

Raymond Saner
CSEND, Geneva, Switzerland

## Synonyms

Multistakeholder assessment of PPP alignment with SDG principles (transparency, inclusiveness, participation)

## Definition

Implementation of SDG 17.17.1- effective public, private, and civil society partnerships, inclusive strategies of partnerships.

## Introduction: The Intentions of the 2030 Agenda Versus the Reality of SDG-PPP Partnership Implementation

The UN General Assembly adopted a resolution called "Transforming our world: the 2030 Agenda for Sustainable Development" on 25 September 2015. The resolution consists of 17 Goals and 169 Targets covering crucial areas of the global development agenda that countries have agreed to implement at the General Assembly meeting in New York. The 17 SDG goals are expected to be achieved in an integrated manner focusing at the same time on social, economic, and environmental sustainability and be implemented in a transparent, inclusive, and participatory manner.

In order to achieve these 17 goals, a very substantial financial investment will be required. Early on at the start of the 2030 Agenda, the United Nations Conference on Trade and Development (UNCTAD) estimated in its 2014 World Investment Report (WIR) that approximately $4 trillion will be required every year in developing countries alone for the SDGs to be achieved by 2030. Given the current levels of investment in all SDG-related sectors by both public and private bodies, developing countries face a funding gap of $2.5 trillion/year (http://www.unece.org/fileadmin/DAM/ceci/documents/2014/PPP_Newsletter/newsletter_06_content_2_WEB.pdf).

However, in view of the severe negative impact of the covid-19 pandemic, there is now already and will be in the near future a serious downturn of economic growth and most likely a related decrease of investment in SDG implementation. As stated by the World Bank:

> Every region is subject to substantial growth downgrades. East Asia and the Pacific will grow by a scant 0.5%. South Asia will contract by 2.7%, Sub-Saharan Africa by 2.8%, Middle East and North Africa by 4.2%, Europe and Central Asia by 4.7%, and Latin America by 7.2%. These downturns are expected to reverse years of progress toward development goals and tip tens of millions of people back into extreme poverty. (Shertok 2020)

It is unlikely that government budgets of DCs and official development aid (ODA) will be able to compensate fully for the ensuing funding gap. Even before the start of the covid-19 pandemic, many developing countries faced fiscal constraints and most donor aids were often channeled toward their current spending needs and not into infrastructure development. Therefore, investments by the private sector are and will be crucial to ensure the realization of developing countries' SDG strategies.

SDG Goal 17 aims to strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development through the development of inclusive institutions at all levels (Resolution adopted by the General Assembly on 25 September 2015, http://www.un.org/ga/search/view_doc.asp?symbol=A/RES/70/1&Lang=E). These partnerships are defined by Goal 17 target 17 as consisting of the following:

> 17.17 Encourage and promote effective public, public-private and civil society partnerships, building on the experience and resourcing strategies of partnerships. (pp. 27, 35)

Whether the solution will be public, public-private, or civil society partnership or all combined, the solutions should build on the experience (past) and the resourcing strategies of partnership – which as stated above – should be transparent, inclusive, and participatory.

The SDG 17 on partnerships also highlights the risks of indebtedness.

> 17.4 Assist developing countries in attaining long-term debt sustainability through coordinated policies aimed at fostering debt financing, debt relief and debt restructuring, as appropriate, and address the external debt of highly indebted poor countries to reduce debt distress.

In other words, whether public, private, public-private, or society based – all financing of SDG goals carry the risk of indebtedness if countries do not carefully assess the potential short, medium, and long-term risks of indebtedness.

## Developing PPP Standards by UNECE

Several international organizations are involved with PPPs for more than 20 years, for instance the World Bank Group, the European Investment Bank, and the Multilateral Development Banks. However, none of these international organizations nor the UNECE, has ever conducted a comprehensive evaluation of PPPs to establish clear factors leading to success or failures of PPPs. UNECE has been active in the field of PPPs and at the sixth session of the "UNECE Team of Specialist on Public-Private Partnerships" held in Geneva in June 2014, an agreement was reached to develop international PPP standards and to create an innovative structure for producing PPPs.

A new UNECE International PPP Centre of Excellence (ICoE) was subsequently created with the intention of it becoming a project-driven, goal-oriented body that produces standards that are both relevant and effective in the evolving PPP landscape. The ICoE was also given the mandate to work in close collaboration with other international organizations including the World Bank and the World Economic Forum to develop standards that will enable the realization of the SDGs (http://www.unece.org/index.php?id=36228).

UNECE's PPP activities are part of its Committee on Innovation, Competitiveness, and Public-Private Partnership (ICOC) and its International PPP Centre of Excellence. UNECE offers to help governments address many of mankind's most pressing development problems, including the greening of the economy and mitigating the effects of climate change, and to discover what partnerships in the world constitute excellence and have the most beneficial impact on development (http://www.unece.org/ceci-welcome/areas-of-work/public-private-partnerships-ppp/icoeppp.html).

In 2014, UNECE launched a new program to develop international PPP standards. The standards and drafting groups which produce the standards consist of the following domains. All the current PPP standards and their development stage are described on UNECE's website (https://www2.unece.org/wiki/display/pppp/PPP+Standards+Development+Process).

## Organizational Structure of UNECE's PPP Centre of Excellence

The organization of UNECE's PPP initiative consisted of a secretariat led by Mr. Geoffrey Hamilton supported by three professional staff and two administrative assistants, a Bureau called the UNECE Team of Specialists on Public-Private Partnerships (TOS PPP) and a UNECE PPP Business Advisory Board.

**Bureau**: As of February 2021, the members of the UNECE Bureau of Specialists on Public-Private Partnerships (TOS PPP) were 14 men and 4 women with geographical backgrounds from Western Europe (7), Eastern Europe (2), North America (2), Japan, Turkey, Morocco, Lebanon, and Uganda. The author was member of the Bureau from November 2018 to November 2021 and together with a colleague from Western Europe was of academic background.) The leadership of the Bureau was shared by 3 co-chairpersons and 15 vice-chairpersons.

**Advisory Board**: From 2014 to December 2020, there was also the UNECE PPP Business Advisory Board which consisted of 24 members mostly from consulting companies and banks.

The objectives of the Business Advisory Board were to advise on the elaboration of international best practices and standards and to assist member states with the implementation of

international PPPs through high-level consultative meetings.

In summary, UNECE's PPP structure consisted of a Bureau of 18 PPP experts and an Advisory Board of 24 PPP advisers. The composition of both entities showed an over-representation of the private sector and of developed country governments and private sector PPP experts. Applying the SDG principles of multistakeholder participation, the composition of the Bureau and of the Advisory Board lacked stakeholders from civil society such as trade unions, consumer groups, and NGOs following the example of the Major Groups of non-state actors who represent well-established interest groups and who participate in the annual High-Level Political Forum of the SDGs (https://sustainabledevelopment.un.org/mgos). The PPP unit of UNECE has continuously made efforts to broaden its membership and to include CSOs to succeed in achieving full multi-stakeholder representation with no success so far.

A new Bureau was constituted on November 30, 2021 consisting of only seven members which are all representing UNECE countries except one who represents Japan. There are five men and two women; four lawyers, two engineers-urban planners, and one from finance. Of the seven members, three are government officials, two are academics with functions in government, and two are in private practice. There is no representation from Civil Society; hence, the current compositions does not live up to the SDG criteria of multi-stakeholder representation.

## The PPP Standard Setting Process and Economic Cooperation

In 2015, UNECE created the **Committee on Innovation, Competitiveness, and Public-Private Partnerships (CICPPP) whose goal is to** help all countries in the UNECE region to promote a policy, financial, and regulatory environment conducive to economic growth, innovative development, and higher competitiveness in and of the ECE region. In its work, the Committee responds to the needs of Governments and considers the needs of the private sector, consumers, researchers, and civil society. It contributes to the economic cooperation and integration, as well as sustainable development of the ECE region (https://unece.org/economic-cooperation-and-integration, accessed on 15 Feb 2021).

While initially focusing on the region covered by UNECE (Europe, North America, and Central Asia), the CICPPP expanded its mandate by focusing on Public-Private Partnerships (PPP) in various social and economic sectors at a global level thereby going beyond the traditional UNECE territorial boundaries. In order to avoid conflicts of influence and overlapping of mandates with the other UN economic commissions such as ECA, ESCAP, ECLAC, and ESCWA, a solution was found to keep the central policy making at UNECE in Geneva while creating knowledge or competence centers in different parts of the world.

In order to further institutionalize the PPP initiative, UNECE created an International PPP Centre of Excellence, a PPP specialist center, which developed PPP standards and recommendations and guidelines, case studies, and readiness assessments (https://www.uneceppp-icoe.org/people-first-ppps/) as well other useful information pertaining to the international PPP networks.

Key areas of work have been achieved over the last 3 years namely the development of PPP standards such as the Zero Tolerance Approach to Corruption in PPP Procurement (2018, ECE/CECI/WP/PPP/2017/4), Standard on Public-Private Partnerships in Railways (2019, ECE/CECI/WP/PPP/2017/4), Standard on Public-Private Partnerships in Renewable Energy (2019, ECE/CECI/WP/PPP/2018/7), Standard on Public-Private Partnerships in Roads (2019, ECE/CECI/WP/PPP/2018/8), and Guiding Principles on People-First Public-Private Partnerships in support of the United Nations Sustainable Development Goals (2019, ECE/CECI/2019/5). (https://unece.org/ppp/standards).

## Better Alignment of the PPPs with the SDGs

The Addis Ababa Action Agenda (Financing for Development) held on 13–16 June 2015 emphasized the importance of infrastructure investment for achieving the SDGs. It notes "that both public and private investment have key roles to play in infrastructure financing, including mechanisms such as public-private partnerships" (paragraph 48, Addis Ababa Action Agenda, http://www.un.org/esa/ffd/wp-content/uploads/2015/08/AAAA_Outcome.pdf).

As an important follow-on to the Addis Ababa Action Agenda (AAAA) and the signing of the SDGs in September 2015 in New York, an Inter-Agency Task Force meeting on Public-Private Partnerships (PPPs) was convened on 16th December 2016 in New York. Participants at the meeting included approximately 20 Task Force members such as UNECE, World Bank, UNDESA, IMF, UNESCAP, UNCTAD, OECD, as well as representatives from national governments (Haiti) and from civil society (EURODAD, Oxfam, IHRB, academia and the private sector (PWC, EY, AIG).

The meeting generated a lot of suggestions on how to structure PPPs in general and how to align PPPs with the SDGs. The report was made available for consultation (http://www.un.org/esa/ffd/wp-content/uploads/2017/02/Summary-of-IATF-meeting-on-Public-Private-Partnerships-16-December-2016-Final.pdf) as well as a Scoping Study on Public-Private Partnerships by Motoko Aizawa in February 2017 (FFDO/UNDESA, working paper series, February 2017, http://www.un.org/esa/ffd/wp-content/uploads/2017/02/Scoping-Study-on-Public-Private-Partnerships_FfDO-working-paper.pdf). Both publications are excellent sources of information for instance in regard to what the different agencies have developed in regard to PPPs and what kind of ability and competencies are important for government agencies responsible for PPPs and in general about capacity building for PPP and SDG implementation.

## Making UNECE PPP aligned with the 2030 Agenda

Criticisms of PPPs became prevalent in the UK, France, and the EU leading some UNECE member countries to decide not to renew the mandate of the BAB. On the other hand, they did not agree to a broadening of the membership to include CSO representatives. As a reaction of lingering old-style PPP practice and rationales, a group of six PPP experts under the guidance of the author wrote and published a study titled "Making PPPs fit the 2030 Agenda" to make the point that the traditional concepts of Value for Money should be enlarged to include Value for Society and Value for the Future Generation. UNECE PPP has started to develop the second form of values calling it People-First-PPPs aiming at SDG compatibility, but much more needs to be done to ensure alignment with the SDGs.

However, more information on the success and failures of PPPs are still missing. A lot of key data remain either dispersed or are not publically available. Scholars and policy makers alike should access the information mentioned above but should also go beyond collecting of "how-to-do" lists and guidelines made available by organizations involved in PPPs. It would for instance be useful to read constructively critical publications such as the one by Jomo et al. (2016) and to respond to their criticism. It would also be important to consult the publication mentioned above to better understand the risks of corruption as well as the potential difficulties of conceiving PPPs in case of market and government failures (http://www.csend.org/images/articles/files/Raymond_Saner_Interview_Seoul_2015.pdf).

This author has suggested at previous conferences of the UNECE PPP unit that an observatory should be created that would focus on analyzing past and current PPPPs. Such an observatory could collect and make available to the public case examples describing success or failure of PPPs from developed and developing countries, offer capacity building training programs, conduct scholarly research on PPPs, and offer neutral third-party assessments of planned PPPs projects without

though being part of the commercial transactions nor being part of PPP projects. Board membership of such an Observatory could be organized similar to the CERN "Scientific Information Policy Board" which requires members to be knowledgeable and independent of vested interests (http://library.cern/about_us/policyboard).

The author recommended that UNECE reassesses the compatibility of its PPP approach with the SDGs principles and ensures that the PPP standard setting process complies with the SDGs goals and targets. In view of the dominant representation of the government sector on the UNECE PPP Bureau, a reorganization is called for that helps democratize the PPP process by inviting consumer-based civil society groups as well as other stakeholders such as trade unions and professional associations from developed and developing countries to partake in the elaborations of standards and best case examples.

Citizens from all UN member countries are entitled to be informed of the strengths and weaknesses of PPPs and be given the right to contribute to the discussions as to whether the PPP approach to financing social and physical infrastructure should be conceived as a public good or not, whether private financing is called for, and whether PPPs contribute to equitable provision of public services for the aging and the young generation.

As a step toward closer application of SDG principles to PPP, the author developed an assessment grid (Figure 1) which was used during UNECE's conference in April 2016. The grid was used by three scholars to assess 20 case examples of PPPs as to how close they were to the principles of the SDGs (inclusiveness, transparency, and participation) and the sustainable development goals of the 2030 Agenda consisting of the three interdependent dimensions namely sustainable economic, social, and environmental development. A copy of the grid is annexed. More work needs to be done by the community of PPP scholars and experts to fine tune the measures and weights attributed to the different goals, but an initial step has been done which will be useful for implementation of the SDGs through PPPs.

## Conclusions

There is more to PPPs than inviting financial wizards to rescue governments short of money or unable to collect sufficient taxes to invest in their social and economic sector as seen adequate and appropriate based on realistic needs assessments of their citizens' current and future needs. PPPs means getting money today to be paid back in the future by the next generation. Similarly to the climate change discussion, it is not right to backload the due payments without giving the citizens and the young generation the ability to take part in the decision-making process.

The SDGs suggest the achievement of sustainable economic, social, and environmental goals (triple bottom line) for each member country of the United Nations. To implement the SDGs, each government is supposed to set its triple bottom line goals, communicate them to their citizens, make the goal setting inclusive and participatory, and provide for means to review and monitor the implementation of the SDGs from 2015 to 2030.

The UNECE PPP standard setting process is too crucial for the future of our societies to be left to private sector providers (construction companies, financial brokers) and government offices often short of democratic legitimacy. Without the inclusion of the civil society actors like consumer groups, cooperatives, labor unions, academic scholars, and teaching faculty, the risk of misguided investment decisions and related rent-seeking behavior by private and public sector actors is too high to be left to experts alone, however competent they might be. What is needed is a PPP Observatory which could add information on PPPs that are often missing or not fully reliable. Such a PPP Observatory could support UNECE and other international organizations but also governments and civil society stakeholders involved in PPPs. A PPP Observatory could help the PPP-SDG process stay on course and ensure that the implementation of PPPs is aligned with SDG principles such as inclusiveness, participation, and transparency.

## Annexe 1

SDG-PPP assessment grid developed by Raymond Saner, 2016

| **Title of the PPP project:** | |
|---|---|

**Overall remarks on evaluation of the case:**

| |
|---|
| |

| Criteria | Comment |
|---|---|
| PPP is in concurrence with SDGs | Yes/No |

| Assessor's name | Criteria | 1 | 2 | 3 | 4 | 5 | Total Score |
|---|---|---|---|---|---|---|---|
| | (Threshold) | 25 | 10 | 10 | **10** | **10** | |
| | | | | | | | |

| General Criteria (1) | Score | Remarks |
|---|---|---|
| (threshold ≥ 25) | (0-40) | |
| ▪ Increases **access** to essential services like health, education, water. | | |

**PPPs and SDGs, the Missing Stakeholder Is Civil Society, Fig. 1** (continued)

| | | |
|---|---|---|
| • Improves **efficiency** and filling the capability gap in the public sector that exists in the country | | |
| • Promotes **equity** and a less unequal society both in terms of income and in terms of women's empowerment | | |
| • Makes services **affordable** to the poor while at the same time generating a reasonable ROI to private sector investor | | |
| • **Enables Replicability** (a characteristic of a project) which allows for scalability and real impact | | |
| • **Provides** capacity building by the company inside its project and outside among critical stakeholders including consumers | | |
| • Contributes to making the planet **sustainable**, mitigating the risks and creating a resilient infrastructure | | |

**PPPs and SDGs, the Missing Stakeholder Is Civil Society, Fig. 1** (continued)

| Specific Criteria | | Remarks |
|---|---|---|
| **People (2)** (threshold ≥ 10) | **Score (0-15)** | |
| **Provides** capacity building (training) by the company inside its project and outside among critical stakeholders including consumers | | |
| Ensures consumer protection at the project site as well as externally | | |
| | | |
| **Prosperity (3)** (threshold ≥ 10) | **(0-15)** | |
| Includes small projects that provide opportunities for local SMEs to provide goods and services | | |
| Offers benefits to local government in terms of taxes and levies in a transparent manner to limit possible corruption | | |
| | | |
| **Planet (4)** (threshold ≥ 10) | **(0-15)** | |
| Project is of low carbon emissions and low agriculture GHS | | |
| Project includes alternative energy technology as much as possible and feasible | | |
| | | |
| **Peace (5)** (threshold ≥ 10) | **(0-15)** | |
| | | |
| Project promotes understanding and respect among all parties | | |

**PPPs and SDGs, the Missing Stakeholder Is Civil Society, Fig. 1** (continued)

| | | |
|---|---|---|
| Project promotes a safe and faire environment that will lead to stability needed to attract private investors (long term peaceful co-existence) | | |
| | | |
| **Partnership (6)** **(threshold ≥ 10)** | **(0-15)** | |
| | | |
| Project promotes the development, transfer, dissemination and diffusion of environmentally sound technologies | | |
| Project respects each country's policy space and leadership to establish and implement policies for poverty eradication and sustainable development | | |

# Practical Aspects of Emergency Management

Melissa Pinke
Jacksonville State University, Jacksonville, AL, USA

## Synonyms

Feasible; Practical-applied; Realistic; Useful

## Definition

Useful ways to plan for respond to and recover from potential or actual disasters

## Introduction

With the many regulations and directives currently in place, it is easy to see how emergency management can become a complicated process, driven by the need to create written plans to meet requirements. In the process of meeting requirements, it is essential the practical aspects of emergency management are not overlooked. Once the bird's-eye view of emergency planning has been done, it is time to get into the weeds so to speak and determine how emergency planning will play out during a real event. This paper will look at some of the practical aspects to consider regarding emergency management.

## Why Is Emergency Planning Needed?

The first determination that must be made is why emergency planning is being done in the first

place. If meeting a requirement is the main reason, then think again. Emergency planning just to meet a requirement provides a check in the box, but it is unlikely to meet the intent of the requirement. Saving lives and property while maintaining and/or returning to business quickly are the reasons regulations exist. Employees and customers must feel safe in order to continue to provide or use goods and services during an emergency or disaster. Therefore, the safety of your staff and customers should be the first priority when planning to weather an event and remain in business afterward.

Before, during, and after a disaster, some goods and services are not likely to be needed, while others are in high demand. Patients often cancel routine medical visits, while others experience life-threatening or urgent conditions caused by the event or other medical issues need to be seen regardless of what is going on. Snow shovels seem to fly off the shelves right before a snowstorm, and sump pumps are hard to be found when there is flooding. If an organization provides basic needs, there is an opportunity to both serve and flourish during a disaster. This will require maintaining some business functions. Knowing what goods and services customers will need and when will guide businesses in determining how long they will need to stay open or reopen before, during, or after an emergency.

## Planning Considerations

It does no good to survive a disaster, but to have everything lost afterward. Taking into account the potential for employee injuries and compliance issues, planning and preparedness can reduce liability and losses. OSHA requires employers provide a workplace free of recognized hazards likely to cause death or serious harm (Lockwood 2005). Safety violations contributed to the Deepwater Horizon oil spill in 2010. Two supervisors on board the oil rig were indicted of involuntary manslaughter due to gross negligence of conditions which contributed to the explosion and deaths of nine workers, while a third executive was charged with obstruction of congress and making false statements while overseeing response of the spill (EPA 2016). British Petroleum pleaded guilty to 11 counts of manslaughter (EPA 2016). How a company is seen caring for its employees and customers will impact its reputation and public perception (Lockwood 2005). Company image can be improved or damaged by your actions and can make or break sales and revenue and will influence stakeholder confidence in an organization after a disaster (Lockwood 2005).

It is more important to put more emphasis on planning rather than a plan document (Perry and Lindell 2003). The idea of planning is to reduce risk through hazard assessments, vulnerability assessments, and risk reduction; these are the actions to identify and decrease the level of danger and identification of resources necessary to get to acceptable levels, so include the experts available (Perry and Lindell 2003). Preparedness is a state of readiness to respond to threats; it is not simply the possession of a written plan (Perry and Lindell 2003). The application and steps are documented in the plan and revised as the plan is tested and updated (Perry and Lindell 2003).

Keep in mind that planning and management are different; planning is part of preparedness, while management is performance-implementing assessment and corrective, protective, and coordinating actions identified in the planning stage (Perry and Lindell 2003). While the same people that are a part of planning may be part of the response leadership, the abilities to rapidly assess, make decisions, and work well with others are key characteristics needed. Actions should be based on accurate knowledge of threats and the likely human responses (Perry and Lindell 2003). It is more important to act on valid information rather than quick information (Perry and Lindell 2003). This may require the need to look at and address interorganizational coordination and how each unit or divisions missions, structures, operational styles, capabilities, and limitations work and may need adjusting when responding to emergency events (Perry and Lindell 2003).

In planning, it is necessary to incorporate both high-tech and low-tech options for response and recovery (Bond 2007). The Internet and

computers are most valuable for managing events off-site, but when technology is unavailable, basic methods must be used. Going back to sending faxes, handwriting orders or talking face to face could be necessary. Review these methods with staff to increase confidence and to reduce errors.

## Emergency Response Leadership

In selecting emergency response leadership, individuals that cannot step up and take charge are best in important support roles rather than leading, regardless of their position. This is sometimes difficult when organizational structures get in the way. Having emergency response personnel on staff can be highly beneficial as they are professionals trained to evaluate situational contingencies and act in accordance with those assessments rather than political agendas (Perry and Lindell 2003). Choosing those to lead during difficult times requires strength, capabilities, knowledge, and ability to look at the big picture; make sure leadership can perform in this manner.

For larger buildings, it will take more than one person to coordinate and implement emergency response procedures. Establish a location emergency action plan team and include safety wardens on each floor to clear areas, direct people, keep lines moving, coordinate special needs, and conduct a headcount to ensure everyone is safe. While it is best if people volunteer, management is ultimately responsible to ensure emergency procedures are in place.

## Emergency Plans

Requirements often dictate lengthy sections in the written plan on organizational vision, mission, roles, responsibilities, and other areas that document how the emergency management program shall be administered. While these are necessary components for planning and preparedness, during emergencies, it is the annexes that detail specific response actions, contact information, and maps which are most needed during response (NFPA 2016). Plans must be created in a useful format; so needed information is quickly accessible. Information must be familiar to those that have responsibilities in the plan. The use of tabbed sections can greatly improve finding important items when seconds count. Having action verbs describe actions, such as "activate alarm systems" or "announce instructions," is much clearer than vague statements such as "the person in charge will determine what to do." Criteria should also be included to determine "triggering" events or what are the conditions for activating various responses. The use of checklists is also highly recommended to make it easier to remember what to do and not miss any important steps (Bond 2007). However, a checklist does little good if the reader has never seen the information before or understands how to apply it.

It is important that not only are appropriate authorities given to those identified in the plan but that they have actual authority to enact provisions they are responsible for. While a position may be named to initiate certain steps, if in real life, they need permission from someone else, then that person needs either to be named or true authority given to the individual. Another consideration is to identify where emergency plan document is physically located. Plans must be immediately available, especially if notification of an event occurs after hours. Anyone with designated responsibilities in an emergency should keep a hard copy or an electronic version of the plan with them at all times. Having direct access to the plan will improve response time. It may also reduce the chance of having to go to the office, delaying response. Plans must also be reviewed at least annually and kept up to date. People leave; phone numbers change; technology evolves; and locations may change. Make sure changes are accurately reflected in the plan and those responsible are made aware of the changes.

## Facility Issues

Facility safety is paramount for considering evacuation plans for all employees, visitors, vendors, and contractors. Within each of these groups are those with special or functional needs that may

require assistance with hearing notifications, reading instructions, speaking English, or exiting upper floors, so contingencies will be needed ahead of time to avoid confusion and delays. Determine all evacuation routes, assembly areas, and hazardous areas along with any places that can create confusion or challenges. Conduct a risk assessment of the facility using one of the many available tools. Take steps to reduce vulnerable situations such as poor lighting, shrubbery to conceal items or people, or relocating electrical devices such as computers off the floors, especially on lower levels. Identify and correct any situations that increase hazards, such as crossing a busy street to go to an assembly area or if the assembly area is located next to flammable material storage.

Employee behavior at assembly areas is also something to consider ahead of time. If there are delays in returning back into the office, determine if employees are free to wander or if they must remain in place. Another potential problem to address is smoking at the assembly area while people are waiting to go back in. While people are waiting or are nervous, they are likely to light up outside. If there are any flammable materials involved, this can turn out to be dangerous. Clear policy and communication regarding smoking during emergencies can reduce issues ahead of time. Typically employees are not on break during an evacuation unless they are given one. Further actions may be necessary, so employees should remain reasonably quiet and ready for further instructions.

## Evacuations and Sheltering

While there is an expectation under the Life Safety Code to evacuate a building in 4 min, it is important to determine if policies and procedures allow this to occur. Not only must people evacuate but also accountability for employees, visitors, and contractors must be established and reported to the emergency coordinator in case someone is left behind. Determine how you will account for employees and visitors, and perform it until it is flawless. The more employees practice, the more reality will impose and identify any wrinkles in emergency plans. Take the time to do after action reviews to identify problems, address deficiencies, and improve response.

Employee identification is becoming more commonplace nowadays. Perpetrators have pulled the fire alarm and then entered the building with the rest of the employees returning. Checking everyone for identification upon reentry should also be considered.

Identify multiple off-site shelter areas to relocate personnel from potentially damaging weather such as rain, cold, or high winds. The building next door is a great idea if it is large enough to hold employees and the building is also not impacted. If this is a larger community event, such as flooding, buildings nearby may also be impacted along with many of the streets across town; so a location out of the area should be found as well.

If severe weather like a tornado hits or there is chemical infiltration into the building, a plan and procedure is needed to protect people inside. Determine safe areas within the building people can move to. For severe winds and tornados, people should be moved to the lowest areas of the building away from doors and windows, so debris does not break through causing further injuries. Consider how to notify occupants and assist those with special needs. These plans need to be practiced to determine how long will it take to get everyone there and identify any bottlenecks that occur and if successful accountability is achieved. There must be provisions in place to quickly shut down air handling systems to avoid drawing in or spreading airborne contamination through the building. This must also include who is responsible and that proper access can be gained quickly.

Practice for these basic response steps is necessary and can point out challenge areas or conditions that need to be streamlined. While most people conduct drills on a sunny day, the reality is it may be raining, snowing, or very hot or cold. Start out simple, but be prepared for bad weather.

## Emergency Communications

It is necessary to determine how to communicate with employees, customers, and vendors before, during, and after a disaster. Establish notification and communication methods to activate your location emergency action plan team and to provide information to people in the building on-site and off-site. Develop and maintain lists of employees, partners, customers, vendors, contractors, and repair services for the physical plant. Include multiple ways to contact individuals, especially during off hours. Consider programming the numbers into cell phones.

Evaluate the existing physical communication systems that can be used to reach others, intranet home page, hotline, bulletin board, password-protected Internet site, or emails, and determine if it is acceptable (Lockwood 2005). The communication plan must clearly spell out who is authorized to create and approve these messages. Have approvals in place ahead of time for all notices. These systems must be immediately accessible, 24/7 by those who are authorized. Emergencies do not pay attention to work schedules. Considerations must include how long does it take to sign in, create your message, and send them. Regular testing will verify how quickly messages will be delivered. A message to evacuate is not very effective if it takes 3 h or more to reach the approver and get an answer. Consider a mechanism for recipients to confirm receipt of the message, so it is clear the message went out and was received. Be sure to test the system at different times of the day, from both inside and outside of the facility to ensure it works. Develop backup methods for access and delivery. The sender should include their contact information in all messages to verify when and how it was sent. All employees authorized to deliver messages need to practice regularly and frequently. Passwords fail, firewalls can block access, and multiple users during a crisis can bog down systems. Anticipate these problems and plan accordingly.

Communication messaging related to an emergency should be clear, with information on both the situation and direction for what actions people should take. People are more reluctant to comply with suggested emergency measures that are vague or incomplete (Perry and Lindell 2003). Using multiple delivery mechanisms will ensure people receive the message and promote the urgency for compliance. Use as many methods as possible and practical for the situation.

Also, make sure communication works between team members when responding. When coordinating an evacuation or other response, consider the use of handheld radios. Test them out before purchasing if possible to ensure they work in all areas of the building or if a repeater is needed. Ensure there is enough and maybe a spare or two in case one breaks. They must be charged and periodically tested to ensure they work and staff maintains competency in using them. Radios can either be assigned to team members or kept in a designated location. There are pros and cons to both. Especially in large buildings, team members need to reach each other and the leader; situations can change and everyone needs to both give and receive critical information quickly. Ultimately communications rely on tools. Ensure people have immediate access to the tools needed.

## Alternate Locations

If you do direct employees to alternate locations, they must know where they are and how to get there. Policy should address additional travel time and how expenses are reimbursed. Don't assume employees know where the alternate locations are or how to get there. Directions should be published and given at the time of the notification to avoid confusion.

Another factor to consider is transportation issues for your staff, visitors, and customers. Consider if it is too dangerous to drive or if public transportation shuts down, how many employees will be able to still make it in. Many times during emergencies and disasters, local officials will direct the public to avoid all unnecessary travel, so consider what does this mean for your

employees and your business. Determine ahead of time if there are critical functions that must continue to serve the public or your customers, the necessary staff needed to perform those functions, and ensure these employees have plans in place at home to ensure family is safe so they can work. If employees must travel, ensure they have identification on them to show they are critical staff and must report. Moving large amounts of people through an area that has travel restrictions during severe weather should not be taken lightly. Consider if existing employees can remain in place until the bad weather is over before traveling. If people do not have to travel during the worst of the weather, try to avoid it.

## Finances

Another critical resource that must be managed during an emergency is money. Develop a plan to maintain financial transactions. Ensure employees can be paid and critical items can be purchased if power or Internet goes down. If banking transactions cannot occur, having cash on hand may be a necessary resource. If employees are unable to work due to a disaster, determine if they will be paid or be required to use vacation time. If employees have to work extra hours, be sure overtime policies are clear and are reviewed. Be prepared to address expenses employees accrue for traveling or hotels.

Financial management needs to factor in multiple variables when facing disasters; the more resources and expenses needed will cost more money, leaving the questions of how is it getting paid for. The more answers are determined ahead of time will reduce additional decision-making and stress at the time of the event.

It is also essential to conduct a review of your organizations insurance policies (Shaw n.d.). Verify what types of events are and are not covered and how is damaged goods or lost revenue compensated. Deductibles and replacement coverage are important things to consider. Exclusions for acts of war seem far-fetched, but damages might not be covered from a terrorist event. Make adjustments to policies based on risks, coverage, and ultimately cost, but more importantly know where the organization stands ahead of time. Do not rely on FEMA reimbursement. It is never enough nor is it quick enough to get back in business immediately. Make sure risks are managed.

## Management Commitment

Everyone has heard it is necessary to establish commitment for the emergency management program by the top leadership (State Farm 2015). Senior management must communicate the priority and support needed for emergency management. Create measurements to track performance of departments and employees for participating in training and exercises and reward them accordingly. Employees will see quickly if leadership supports emergency preparedness by their actions as well as their words. If leadership does not support the program, it will most likely not work when you need it to.

## Training

It is necessary for everyone involved in the organization, including leadership, to participate in emergency preparedness training. Employees must know their roles (Perry and Lindell 2003). People need to know what is expected of them, what is likely to happen, and what the organizations can and cannot do for them (Perry and Lindell 2003). Ensure people understand the information and can execute actions when it is necessary. Therefore practice should be a part of training. It is also necessary for teams to train together for operability, understanding each other's roles and priorities in realistic scenarios, including community partners on a regular basis (Bond 2007). Provide training, drills, and exercises to develop team competency. Throwing a team of experts together does not make an expert

team (Burke et al. 2004). Trust and competencies must be developed together in order for good performance during emergencies.

Determine what professional responders can and will do for your facility in various scenarios during planning. Don't assume the police will search your building if a bomb threat is called in. Police may not even say it is safe for people to return to the building, so work with them ahead of time to determine how this will be handled.

Conduct action reviews after each drill, exercise, or potential or actual event. Look for what worked well and what needs to be changed. Have a process to ensure corrective steps are taken and assign accountability. While many businesses may rely on 911 to handle emergencies, during a disaster, highest priority calls are taken first and basic response may be up to facility staff. It is best to be as self-reliant as possible.

## Conclusion

In order for effective emergency management, it requires planning, training, exercising, acquisition of equipment and resources, and the need to include outside partners. Planning is a process of analysis, development, and maintenance of individual and team performance skills achieved through training, drills, and critiques (Perry and Lindell 2003). While this paper has attempted to cover many practical aspects of emergency management, it is certainly not inclusive of all of them. A good philosophy to go by is if it can be planned for, it can be prepared for. Better decisions will be made when management and responders, both internal and external, can plan ahead by discussing various scenarios, response actions, and outcomes ahead of time. Response will be much better than waiting to make decisions with the pressure of an event unfolding.

Many of the lessons identified in this paper were learned through drills, while some were unfortunately learned through actual events. Take the opportunity to critically examine procedures and expected outcomes now while the sun shines, in order to make emergency management run smoother during a disaster. Practice for real-life events is what makes an emergency plan practical.

# Pragmatism Matters in Chinese Public Hospital Management and Doctor-Patient Relationship

Shaozhuang Ma[1], Xuehu Xu[2], Virgínia Trigo[1] and Nelson J. C. Ramalho[1]

[2]Department of Gastrointestinal Surgery, The Third Affiliated Hospital of Guangzhou Medical University, Guangzhou, China

## Synonyms

Chinese Hospital Management; Commitment HR practices; Doctor-patient relationships (DPR); Pragmatism; Turnover intention

## Definition

Pragmatism is defined from an individual point of view as putting considerations of utility (for oneself) above any other type of consideration when making professional decisions.

## Introduction

Healthcare management policymakers are currently concerned about tackling the deteriorating doctor-patient relationship (DPR). The tension of DPR has contributed to an increased turnover intention among Chinese doctors (Lin et al. 2014). A solution may reside in the growing evidence that human resource management (HRM) is an important tool for improving employee well-being and delivering high-quality patient care in China (Cooke and Bartram 2015). Especially commitment HRM should be given priority because they may positively impact DPR and lower turnover (Ma et al. 2016).

However, previous findings might not always be replicated in Chinese healthcare contexts due to the cultural value of pragmatism, because in a pragmatism-based situation, decision-making is mostly of a transactional nature, a situation common in current Chinese hospital settings (Cooke and Bartram 2015). This study challenges this assumption by testing a boundary condition of commitment HRM policies in healthcare settings in China. Using a sample of 508 doctors from 33 tertiary public hospitals in Guangdong, China, this study examines the moderator effect of pragmatism on the relationship between commitment HRM policies and turnover intention via DPR. The study reveals that commitment HR practices are positively associated with the DPR and that overall DPR is negatively related with turnover intention. Furthermore, our results suggest that pragmatism moderates the association between DPR and turnover intention in the model.

## Chinese Healthcare Reforms and Pragmatism Model of Doctor-Patient Relationship

Along with China's opening-up policy at the end of the 1970s, the Chinese healthcare system has undergone two major phases of reform: the first round is a market-oriented reform from the early 1980s to 2002, and the second is a comprehensive reform from 2003 to the present. An important outcome of the marketization reforms was the continuous reduction of government subsidies to less than 10% by 2000 (Ramesh and Wu 2009). As a result, the marketization prompted by healthcare reforms since the 1980s in China turned public hospitals into "for-profit" organizations by maintaining their survival and development through user charges and pharmaceutical markups (Dong et al. 2014). Hospitals encourage doctors to overprescribe drugs, medical tests, and treatments in order to meet the expenses of their own personal pay and hospital revenues (He 2014), creating serious ethical violations, corruption, and injustice in the society at large. The overdiagnosing and overprescribing make patients and families pay out-of-pocket fees and then lead to mistrust of doctors.

Cooke and Bartram (2015) argue that when individuals bear high costs, as consumers they, in turn, have high expectations of services from the medical staff and hospitals at all levels. "Patients' poor experiences and often unmet expectations can accumulate, result in doubt into an individual doctor's treatment and a general distrust in health care professionals and finally may break out into open doctor-patient conflicts" (Hu and Zhang 2015: 1651). Since doctors are afraid of being accused of misdiagnosis, they resort to defensive behaviors, particularly by overprescribing to avoid making a mistake. Such defensive behaviors further increase the distrust and anger against doctors and result in the increasing tension in DPR, thus creating a vicious circle.

This pragmatic approach of DPR in which public hospitals act as for-profit businesses and "patients" as "consumers" has also brought suffering to doctors (Ma et al. 2017). For example, a study by Lin et al. (2014) showed that violence against doctors resulted in doctors' burnout, job dissatisfaction, and turnover intention.

## Institutional Change and Turnover of Doctors in Public Hospitals

Until the 2009 reform, the healthcare sector was one of the few areas that remained under the planned economy system, and public hospitals were run as part of the government administration. For example, senior hospital managers were typically appointed by local governments with attached official ranking status. Medical staff were given budgeted posts instead of signing employment contracts with the hospital in the same manner as any other government employees, and almost all Chinese doctors were employed full time and not allowed to work for any other medical organization. Therefore, the mobility and turnover of medical professionals in public hospitals in China were constrained to a very low level under the planned economy approach. This situation has changed since 2009, with the emergence of private hospitals and with new medical policies giving extended rights to certified doctors.

As part of the reform initiated in 2009, the Chinese government encouraged non-governmental entities to invest in hospital services. As of the end of April 2017, while private hospitals increased to 16,876, public hospitals continued to decrease to 12,602, accounting for 43% of all hospitals in China – a 15% decrease compared with 2012 (National Health and Family Planning Commission 2017). The decrease in the number of public hospitals coupled with the decentralization of their personnel management system, as well as the emergence of joint-ventured and private hospitals, contributes to a substantial rise of medical staff turnover rate, particularly of senior professionals in China's public hospitals (Zhang et al. 2016). A more recent initiative of this round of healthcare reform is to allow doctors to offer medical services at multiple sites by pushing a multi-site medical practice in an attempt to increase doctors' motivation and resource sharing by different healthcare units. In 2014 the *Notice on Developing and Standardizing Multi-site Medical Practice of Certified Physicians*, issued by the National Health and Family Planning Commission, endorsed this provision.

At the same time, the Chinese government has been decentralizing and deregulating the hospital management system. Public hospitals have become legal entities with rights to independently recruit, allocate, and manage employees and with the autonomy to establish internal incentive mechanisms. Gradually, the personnel management of China's hospitals has been transformed from a national and unified employment model to an autonomous employment system in which hospitals have independent rights to recruit clinical talent and design positions according to human resource planning. Along with this institutional change, clinician turnover has emerged as an issue due to the "pull force" of opportunities in the medical market and the "push force" of escalating tensions and conflict between patients and doctors in public hospitals.

## Doctor-Patient Relationship and Turnover Intention of Doctors in Public Hospitals

Doctors' turnover in recent years has been on the increase with strong evidence that tense relationships between doctors and patients, and workplace violence punctuated by medical disputes, play a significant role in their decision (Lin et al. 2014). Due to the insufficient investment in healthcare, doctors in Chinese public hospitals are chronically overworked while receiving low pay and little or none of the recognition they deserve from society. The frequent occurrence of violent attacks and bodily injuries make personal safety a top concern of China's doctors since they often become victims of violence. For example, Wang's research (2012) found that personal safety and social respect were the top concerns of 65% of the doctors surveyed, in contrast with 53% who asserted that their utmost priority was to cure patients' diseases. Similarly, Ding et al. (2014) argue that doctors who have suffered workplace violence are twice as likely to foster turnover intention as those who have not. Thus, the tension and conflict in DPR turn out to be the "push effect" for turnover behavior of doctors in public hospitals. These study results suggest that DPR is negatively associated with turnover intention in the overall sample. That is, the lower is the level of perceived DPR by doctors, the higher is the turnover intention.

## Commitment HR Practices and Doctor-Patient Relationship

A commonly used solution to tackle high turnover in China is to promote commitment HR practices (Ma et al. 2016), and in recent years Chinese hospitals have been increasingly exploring different HR approaches to cope with the competition. Strategic HR scholars contend that control and commitment HR practices represent two different HR styles (Ma et al. 2016). While control HR imposes compliance with rules and regulations on employees, the commitment approach focuses on motivating employees to contribute higher levels of discretionary behaviors through participation in decision-making and teamwork (e.g., Collins and Smith 2006). Recent studies suggest that China-based HRM systems consist of both control and commitment (Ma et al. 2016). This study applies the concept of commitment HR that focuses on practices such as participation in decision-making, internal communication, and teamwork (Xiao and Tsui 2007). The current study reveals that there is a positive association between commitment HR practices and DPR. The overall findings demonstrate the value of commitment HRM in improving patient care like DPR and in retaining senior hospital managers and doctors by reducing turnover intention.

These findings imply that turnover intention might be reduced by introducing commitment HR practices to improve DPR. The results are consistent with the arguments that HRM focused on participation and empowerment might improve patient care quality. The finding suggests that Chinese healthcare organizations should value teamwork, effective collaboration, and open communication. Therefore, this study argues that commitment HR practices characterized by participation in decision-making, good internal communication, and teamwork can be the "one stone" to "kill the two birds" of the deteriorating DPR and turnover issues faced by many Chinese hospitals.

## Pragmatism and Individual Values

The effectiveness of HRM policies should be considered in its societal context. One important cultural value that pervades Chinese society and determines both ethical and heuristic behaviors is its embracement of pragmatism. This orientation has been present for centuries in Chinese philosophy and culture and has been extensively studied from different perspectives, but to the best of our knowledge, it has never been approached from the viewpoint of how it may

affect employees' decisions to stay or leave an organization.

In organizational studies, Hofstede's fifth cultural dimension, "long-term orientation" (first named Confucian dynamics), was introduced in 1988 after an extensive survey conducted with Chinese subjects. This dimension reflects how extensively societies seek to face future challenges through solutions that have been used in the past (Hofstede and Bond 1988). Short-term-oriented societies are normatively based, while long-term-oriented societies are pragmatic (as they favor more relativism). Traditional Chinese scientific thinking is recognized as being deeply pragmatic (Li and Wu 2016; Stephens 2009). Although this cultural characteristic was briefly rejected in the 1950s because it favored incremental change through education (reform) over radical change (revolution) as a way to improve societies, it was revived in the 1980s, along with the reform and opening which endorsed pragmatism, openness, and economic liberalization. The most well-known expression of pragmatism from this period came from Deng Xiaoping's thought on the white or black cat – "Never mind whether the cat is black or white, so long as it catches mice."

The emergence of individual-focused pragmatism in healthcare, expressed in consequentialism, can change the logic of group relationships and translate into instrumental opportunism. This corrodes the moral grounds that ensure the primacy of collective interest, and an instrumental-based ethical climate may foster corruption in hospital settings (Stachowicz-Stanusch and Simha 2013). Following this perspective, pragmatism is defined in this study from an individual point of view as putting considerations of utility (for oneself) above any other type of consideration when making professional decisions.

All in all, pragmatism may be an important dimension to consider when studying organizational behavior because of its potential to change outcomes from value-based variables such as commitment HR practices. This study suggests that individual pragmatism moderates the relationships between commitment HR, DPR, and turnover intention in such a way that DPR plays some role in explaining turnover intention only for the low-pragmatism condition.

First of all, this study reveals significant differences in means for DPR and turnover intention, in which the low-pragmatism group reports lower commitment HR, lower level of DPR, and higher turnover intention. This could be an expression of a stronger sensitivity and disappointment with prevailing consumerism and opportunism in hospital settings, as low-pragmatism individuals will be keener to rely on value-based criteria. Also, high pragmatism individuals are more aligned and benefit from the emerging pragmatic system and thus quite understandably report the higher commitment HR, the higher level of DPR, and the lower turnover intention. This can be taken as a dynamic that will favor high pragmatism in healthcare and drive low-pragmatic individuals out of the system.

In addition, this study shows there is a striking contrast between the high and low-pragmatism groups for the relationship between DPR and turnover intention. The high pragmatism group shows a nonsignificant relationship, while there is a significant negative relationship for the low pragmatism. This lends support to the existence of a moderation effect of pragmatism. When taking the sample as a whole and disregarding the pragmatism level, findings follow the expected path from commitment HR practices to DPR to turnover intention.

Pragmatism, as shown in this study, might be a two-edged sword, because having it to some degree would be necessary to withstand the pressures of organizational change. Too little will create rigidity and prevent the necessary flexibility, but too much would push the individual into the utilitarianism grounds, which may lead to sacrificing professional mission as a doctor to save lives and protect physical well-being, creating ethical challenges in a healthcare setting. However, a competing interpretation will state that high pragmatic individuals are those who are more effective in resisting poor DPR, as it does not push them into wanting to quit. This apparent resistance can stem from several

reasonable causes such as focusing more on personal benefits, being less emotionally engaged with patients and patients' relatives, or being more "looking-to-oneself" instead of being concerned with the overarching logic of the system. An alarming implication of this finding for the ongoing healthcare reform in China is that should consumerism and opportunism in hospital settings continue, fewer low pragmatic individuals will stay and serve in hospitals, while more high pragmatic ones will stay and continue the "for-profit" mentality, thereby worsening DPR. This has systemic implications that should not be overlooked by policymakers.

## Implications

These findings have two implications: (1) commitment HR practices can be an effective tool to implement policies that counter deteriorating DPR in the Chinese healthcare sector, and (2) commitment HR practices will have a different influence on turnover intention via DPR whereby only the low pragmatic individuals will be less likely to quit from their hospitals.

Additional implications concern deciding first about the extent to which DPR is important in preventing turnover intention and, second, whether pragmatism should be taken as a critical variable. Findings suggest that DPR can be managed to prevent turnover in low pragmatic individuals, but managers will lack this tool for high pragmatic individuals. So, findings indicate that pragmatism matters for managers and policymakers. From HRM ethics and stakeholder perspective, HR managers should be cautious in recruiting and placing high pragmatic individuals in clinical positions in order to ensure the interests of patients are respected.

In conclusion, pragmatism has a significant moderation effect in the paths established from commitment HR practices to DPR and turnover intention in such a way that, in the low-pragmatism sample, commitment HR practices are associated with better DPR, while DPR is associated negatively with lower turnover intention.

# Prayer in Implementing Social Policy

Bill Dudley
U.S. Department of Defense, Virginia Beach, VA, USA

## Synonyms

*God*: Almighty; Authority; He; One; Provider

## Definition

*Objective Moral Standard* Merriam-Webster (www.meriam-webster.com) defines moral as "considered right and good by most people: agreeing with a standard of right behavior." When combined with an object (God) from which the standard is provided there is a reference point to where authority, integrity, and morality combine in governance over the subjective will of man.

## Introduction

The ultimate goal of social policy is the mitigation of an identified need for the better good of the people. Deciding what social need is warranted and then legislated, funded, and supported must be validated against some sort of standard. This work assumes some moral standard in each and every endeavor. At issue is the diverse moral standard among society that elicits division and animosity. So there must be an objective moral standard that is the guideline for setting policy. If there is a moral standard, then there must be an entity that provided the wisdom, intent, and applicability of the standard. In applying that standard there must be an acknowledgment of the provider and an attempt in knowing and following the wisdom of that origin. There must be a relationship that is established with the provider, which this endeavor submits as God, which enables the public servant to captures God's wisdom and intent in meeting the societal need. That relationship is established and maintained via communication in which the vehicle is prayer. While it is evident in a diverse society that some will vehemently oppose that supposition, governments have throughout history sought that very relationship.

The purpose of this entry is not to determine if God exists. Rather, the concern here is the role prayer plays in the implementation of social policy. Prayer is examined in its personal form (through devotion), its professional form (through servant leadership), and its public form (in practice, perception, and provision).

## Why the Discussion?

Diversity has become a key principle, rightly so, in which policy makers must consider when enacting or developing agents of delivery to meet an acknowledged need. However, within that framework of diversity are distinct and unique culture and belief systems that come in conflict with that very diversity. So how is the decision, to implement policy, decided when those diverse systems of belief and culture conflict in purpose and scope? Is it majority wins? Some would think. Yet many hot topic policy decisions have been made that support only the smaller fraction of some members of society. Is it monetarily driven? In some cases and in others it is a political power move. Other

examples could be cited but not necessary to the argument. Is it always the greater good of society that many would like to cite as justification? If it is, who decides what is good? Again, what is the moral standard?

Currently there is contention in respect to the intention of religious liberty mandates in numerous countries. There are many that believe religious influence in any way has no right or benefit in the public domain. There is strong sentiment from numerous organizations to have prayer of any kind banned in the governmental platform. This becomes interesting as countries where this struggle rises to notice are demographically religious by large percentages. Those in that religious demographic believe in prayer for wisdom and guidance. Do the wants of a substantially less numbered constituency culture trump the needs or wants of the much larger demographic? Every policy presents a solution that has winners and losers. Who decides? The answer of course is not easy.

Within this battlefield of opinion are curious ethical irregularities. Is it permissible for presidents, kings, and leaders to call for prayer in each and every disaster, whether they are by natural divine providence, or by psychopaths, intent on causing harm? No matter the political party there are calls for prayer and condolences. Many of those same legislators and leaders reject the premise of the need or utility of prayer in conducting daily governmental tasking. When dignitaries or celebrity lives have come to their end, these same leaders send prayers and best wishes to the families in very public declarations.

In the very founding documents of the United States, numerous references to the Almighty are evident. Numerous early monuments of the capital city declare commandments, writings, and scripture on the institutional building architecture. Currently a small constituency seeks to have those inscriptions removed and prayer banned in those buildings once free to all ideals. The argument may be that we need to remain neutral. That is a very subjective term, for no one is really neutral in any position. Even those that call for tolerance and diversity seek heavily to have their opinion (belief structure) as the statement of truth. Every policy-maker comes from a paradigm of belief that directs their worldview and subsequent action.

When deciding on actions affecting those large religious (believers in an Almighty) demographics, why is it so wrong to invoke the wisdom of the Almighty? When the Almighty is left out the standard then is man who has proven to fall short time and time again. When moral and ethical decisions are being made, why is it wrong to involve the One that instituted those moral and ethical standards? Does diversity and tolerance demand the abstinence of religious thought and action? If so, is that really diversity and tolerance in action? While no one religious dogma should control or coerce others into subjection, the open acknowledgment of the Almighty on occasions of needed wisdom should not be excluded.

## Prayer That Is Personal

Relationships are at the heart of every endeavor of life. The family relationship is one of utmost importance and has a dramatic influence on all other relationships. The interaction, cooperation, communication, and compromise that are needed in the family relationship guide and direct the further expansion of relationship into the community. Each of the character traits of the individual are molded and reinforced within the family structure. One of the more important skills learned within the family context is conflict resolution. How does the individual face relationship struggles, health issues, financial hardship, or the myriad of other challenges of daily life? There must be a developed sense of direction and purpose that leads to effective problem-solving.

The direction and purpose of an individual has a foundational base in the moral principles displayed and promoted within the family structure. Yet, there must be an authority for the moral fiber of the relationships. For a large demographic, their morals, purpose, and direction are learned and reflected via the personal relationship with the Almighty. Certainly the parental leadership has a huge influence, but belief in an Almighty cannot be coerced. A behavior model can be coerced but character and internal morality

cannot be forced. It is the result of experience and evidence that the individual prioritizes via relationship with the Almighty. As evidence is presented in the divine documents, and experienced thru principles validated in real world situations, it is the personal communication with the Almighty and the witnessed response that builds the trust and reliability on the Almighty.

Altruism and the desire to serve others is not a natural predisposition. The opposite is actually the natural desire. Most would have to admit the selfishness and self-adoration that exists within. That is overcome only as the individual realizes there is a greater purpose to serve. The personal development of that purpose comes through the vehicle of prayer as the wisdom, love, and direction of the Almighty is sought. Volumes have been written on individuals who once sought selfish gain, but whose heart was turned by a relationship with the Almighty that resulted in a passion to impact and serve others that had worldwide change and utility for many. Mother Theresa and her dedication to ease the plight of the poor, William Wilberforce and his passion to have slavery abolished, the Salvation Army and the millions touched by their generosity all have their roots in an individual who sought the wisdom, love, and direction of the Almighty as a result of the touch upon their heart through the purposed communication provided through prayer. Prayers that were done in secret, tears that were shed, sorrows that were shared, and hopes that were expressed were all done in the privacy of the home. It was the personal activation of faith that produced the changes. It was the personal, prayerful relationship that was built with the Almighty, unseen by the masses, which impacted the world. Had these individuals chosen to remain private in their purpose, and withheld the wisdom provided through the hours of prayer, many a life would have remained in despair waiting on relief for their sorrow and pain.

Purpose, character, and initiative are personal and developed with family, friends, community, and the relationship with the Almighty. Those relationships spark the drive for individuals to seek public service and influence in order to participate in the change for the greater good of society. It is the personal prayers that lead to that expression in the professional workplace through leadership and involvement in policy advocacy.

## Prayer That Is Professional

A glance into the biography of a stellar achiever or one that has presented a legacy of superior service will reveal strength in leadership and an acknowledgment of personal integrity. While leadership is developed in certain roles within the family context, much more is learned and honed in the execution outside the family unit. Yet the character and moral development resultant from prayer and the family relationship is the foundation that many leadership qualities are built upon. Servant leadership principles find their success in individuals who learned that leadership is all about serving. That serving principle, tied back to the altruistic spirit, again goes against the natural grain. It would be ignorant to express that only servant leaders get things done. Certainly, despots through centuries achieved phenomenal works done through coercion and fear. While many would say governmental policies could fall into that category, the assumption this work makes is that public servants really are trying to advance the good of the people.

What then defines the separation between the despot and the servant leader? The answer is found in the attitude of the heart and the integrity of purpose. The despot is driven by greed and personal grandeur. The servant leader is purposed to make a difference in the lives of those they serve. The despot seeks and serves self. The servant leader seeks the will of God and the hope of using the wisdom and skills learned to make a change that benefits society. One accomplishes through fear what the other accomplishes through the empowerment of others willing to follow because of the sincerity expressed and demonstrated by the servant leader. While the followers may not share the same moral and ethical principles of the servant leader they follow because of the integrity displayed. While subordinates may not pray or believe in prayer, they respect the servant leader that does knowing that the result is not self-centered but others centered. Why pray to an Almighty for self-fulfillment? Why pray for

wisdom if it is already inherent within the individual? Is it then wrong that subordinates or customers see a leader pray if that same prayer is not forced upon them? Within the work environment many ideas and cultures are expressed through pictures on desks, slogans on shirts, conversations, and actions that run the gambit of ethical and moral boundaries. Each occurrence is a direct representation of a worldview or culture of belief. Certainly there is diversity, and there is tolerance, but why only for those that choose not to believe in God?

Public service is not easy; sometimes, it is not even pleasant. Trying to meet the needs of such diversity comes with challenges. It demands the public servant to invest and commit their time and talent all for the edification of others. In every policy endeavor, moral and ethical decision are made. The professional public servant that makes decisions based on their own volition or some coerced allegiance to an outside entity will quite often create problems rather than find solutions for the contingency they serve. As stated, every policy that finds funding and implementation will always have a negative effect on some. Sometimes, it is in accountability for wrongdoing, at other times it is the unintentional impact upon certain individuals. Certainly, wisdom is needed to mitigate the unintentional impacts.

While the leadership contingency draws wisdom and ideas from other leaders, the wisdom and intent of the Almighty will always find the best solution for all. The servant leader that has learned to utilize prayer to not only seek the wisdom of God, but to also put in check any selfish desire, can rest knowing that the integrity of the decision was based on others and not on selfish gain. That professional decision is the outcome of communications starting with the personal prayers in the family unit. Why would anyone not want that as part of the professional decision-making process? Would a better process be the self-absorbed individual bent on fame and fortune?

## Prayer That Is Public

Transparency seems to be a catch-phrase for the politically correct. Society demands integrity and character of its leaders if trust is to be developed. That trust is built upon observance of integrity in action. Those claiming transparency often fall prey to modern technology that catches the hypocritical practices of leaders who promote one set of morals in public, but in private demonstrate the opposite. Trust is built by those that display the same moral standards in public that they live in the private and professional environment. Why should the spiritual servant leader be required to hide the very foundation of faith that provides the bedrock of success that led to the beneficial policies that flow from the conversation with the Almighty? Many of the United States presidents have volumes of personal letters and communication which cited the deep passionate guidance received from the vehicle of prayer with the Almighty. Why the rush to abandon that process today? To be transparent is to reveal the driving passion that makes the servant willing to put the needs of others first and to be a good steward of the responsibility laid upon their shoulders. So in practice, prayer seems a logical response to God to start any endeavor.

Certainly, there will never be the utopia of consent by all individuals in any societal setting. The hope is that the contingency sees the intention of pure motive when decisions are being made. Respect can be given to an opposing view if the intent of the heart is perceived to be focused on trying to do the right thing. Integrity once was a driving principle in compromise for reaching decisions that were beneficial to the contingency. The perception of honor was based on the observance of the actions of the leader in their public and personal lives. In decades and centuries past, it was perceived to be honorable to pray and ask for guidance of the Almighty. Certainly there are those that used the generosity of trusting individuals and presented the façade of being spiritual to get votes and power; but the dishonesty of those chameleons should not be used as the excuse to be rid of prayer for those that earnestly and sincerely rely upon the Almighty for wisdom. The perception of prayer is favorable in times of disaster, chaos, and in the death of cherished public figures; even sought after, but now there is reluctance and a forced abolition in the public demonstration. This is a detriment to the better good of society.

The forced abolition will lead to the self-centered decision-making of power brokers intent on personal gain. That perception is already evident and prevalent in many governmental dealings.

## Conclusion

Finally, the performance of prayer provides the transparency, perception, and professional consideration while seeking the greatest possible resolution for the problems that place such high demand upon public servants. No single individual possesses the intellect or wisdom greater than the Almighty that graced the creation of this universe and placed the differing cultures that bring beauty to life. There is no need to hide or cast out such a great tool to bring success in the public arena. Prayer should neither be feared or coerced but part of the dialogue of differing ideas and cultures that result in wisdom that has led so many to provide great change and benefit to society. The personal devotion, the professional dedication, and the public display resultant from the communication with God will lead to altruism and integrity that will impact lives and bring honor to the public servant and those they serve.

# Preparedness Measures' Implementation in Crisis Management

Melissa Pinke
Jacksonville State University, Jacksonville, AL, USA

## Synonyms

Feasible; Practical-applied; Realistic; Useful

## Definition

Useful ways to plan for respond to and recover from potential or actual disasters.

## Introduction

With the many regulations and directives currently in place, it is easy to see how emergency management can become a complicated process, driven by the need to create written plans to meet requirements. In the process of meeting requirements, it is essential the practical aspects of emergency management are not overlooked. Once the bird's-eye view of emergency planning has been done, it is time to get into the weeds so to speak and determine how emergency planning will play out during a real event. This paper will look at some of the practical aspects to consider regarding emergency management.

## Why Is Emergency Planning Needed?

The first determination that must be made is why emergency planning is being done in the first place. If meeting a requirement is the main reason, then think again. Emergency planning just to meet a requirement provides a check in the box, but it is unlikely to meet the intent of the requirement. Saving lives and property while maintaining and/or returning to business quickly are the reasons regulations exist. Employees and customers must feel safe in order to continue to provide or use goods and services during an emergency or disaster. Therefore, the safety of your staff and customers should be the first priority when planning to weather an event and remain in business afterward.

Before, during, and after a disaster, some goods and services are not likely to be needed, while others are in high demand. Patients often cancel routine medical visits, while others experience life-threatening or urgent conditions caused by the event or other medical issues need to be seen regardless of what is going on. Snow shovels seem to fly off the shelves right before a

snowstorm, and sump pumps are hard to be found when there is flooding. If an organization provides basic needs, there is an opportunity to both serve and flourish during a disaster. This will require maintaining some business functions. Knowing what goods and services customers will need and when will guide businesses in determining how long they will need to stay open or reopen before, during, or after an emergency.

## Planning Considerations

It does no good to survive a disaster, but to have everything lost afterward. Taking into account the potential for employee injuries and compliance issues, planning and preparedness can reduce liability and losses. OSHA requires employers provide a workplace free of recognized hazards likely to cause death or serious harm (Lockwood 2005). Safety violations contributed to the Deep Water Horizon oil spill in 2010. Two supervisors on board the oil rig were indicted of involuntary manslaughter due to gross negligence of conditions which contributed to the explosion and deaths of nine workers, while a third executive was charged with obstruction of congress and making false statements while overseeing response of the spill (EPA 2016). The British Petroleum pleaded guilty to 11 counts of manslaughter (EPA). How a company is seen caring for its employees and customers will impact its reputation and public perception (Lockwood). Company image can be improved or damaged by your actions and can make or break sales and revenue and will influence stakeholder confidence in an organization after a disaster (Lockwood).

It is more important to put more emphasis on planning rather than a plan document (Perry and Lindell 2003). The idea of planning is to reduce risk through hazard assessments, vulnerability assessments, and risk reduction; these are the actions to identify and decrease the level of danger and identification of resources necessary to get to acceptable levels, so include the experts available (Perry and Lindell 2003). Preparedness is a state of readiness to respond to threats; it is not simply the possession of a written plan (Perry and Lindell 2003). The application and steps are documented in the plan and revised as the plan is tested and updated (Perry and Lindell 2003).

Keep in mind that planning and management are different; planning is part of preparedness; and while management is performance-implementing assessment, corrective, protective, and coordinating actions are identified in the planning stage (Perry and Lindell 2003). While the same people that are a part of planning may be part of the response leadership, the ability to rapidly assess, make decisions, and work well with others are key characteristics needed. Actions should be based on accurate knowledge of threats and the likely human responses (Perry and Lindell 2003). It is more important to act on valid information rather than quick information (Perry and Lindell 2003). This may require the need to look at and address inter-organizational coordination and how each unit or division missions, structures, operational styles, capabilities, and limitations work and may need adjusting when responding to emergency events (Perry and Lindell 2003).

In planning, it is necessary to incorporate both high-tech and low-tech options for response and recovery (Bond 2007). The Internet and computers are most valuable for managing events off-site, but when technology is unavailable, basic methods must be used. Going back to sending faxes, handwriting orders, or talking face to face could be necessary. Review these methods with staff to increase confidence and to reduce errors.

## Emergency Response Leadership

In selecting emergency response leadership, individuals that cannot step up and take charge are best in important support roles rather than leading, regardless of their position. This is sometimes difficult when organizational structures get in the way. Having emergency response personnel on staff can be highly beneficial as they are professionals trained to evaluate situational contingencies and act in accordance with those assessments rather than political agendas (Perry and Lindell 2003). Choosing those to lead during difficult

times requires strength, capabilities, knowledge, and ability to look at the big picture; make sure leadership can perform in this manner.

For larger buildings, it will take more than one person to coordinate and implement emergency response procedures. Establish a location emergency action plan team, and include safety wardens on each floor to clear areas, direct people, keep lines moving, coordinate special needs, and conduct a headcount to ensure everyone is safe. While it is best if people volunteer, management is ultimately responsible to ensure emergency procedures are in place.

## Emergency Plans

Requirements often dictate lengthy sections in the written plan on organizational vision, mission, roles, responsibilities, and other areas that document how the emergency management program shall be administered. While these are necessary components for planning and preparedness, during emergencies, it is the annexes that detail specific response actions, contact information, and maps which are most needed during response (NFPA 2016). Plans must be created in a useful format; so needed information is quickly accessible. Information must be familiar to those that have responsibilities in the plan. The use of tabbed sections can greatly improve finding important items when seconds count. Having action verbs describe actions, such as "activate alarm systems" or "announce instructions," is much clearer than vague statements such as "the person in charge will determine what to do." Criteria should also be included to determine "triggering" events, or what are the conditions for activating various responses. The use of checklists is also highly recommended to make it easier to remember what to do and not miss any important steps (Bond 2007). However, a checklist does little good if the reader has never seen the information before or understands how to apply it.

It is important that not only are appropriate authorities given to those identified in the plan but that they have actual authority to enact provisions they are responsible for. While a position may be named to initiate certain steps, if in real life, they need permission from someone else, then either that person needs to be named or true authority given to the individual. Another consideration is to identify where emergency plan document is physically located. Plans must be immediately available, especially if notification of an event occurs after hours. Anyone with designated responsibilities in an emergency should keep a hard copy or an electronic version of the plan with them at all times. Having direct access to the plan will improve response time. It may also reduce the chance of having to go to the office, delaying response. Plans must also be reviewed at least annually and kept up to date. People leave; phone numbers change; technology evolves; and locations may change. Make sure changes are accurately reflected in the plan, and those responsible are made aware of the changes.

## Facility Issues

Facility safety is paramount for considering evacuation plans for all employees, visitors, vendors, and contractors. Within each of these groups are those with special or functional needs that may require assistance with hearing notifications, reading instructions, speaking English, or exiting upper floors, so contingencies will be needed ahead of time to avoid confusion and delays. Determine all evacuation routes, assembly areas, and hazardous areas along with any places that can create confusion or challenges. Conduct a risk assessment of the facility using one of the many available tools. Take steps to reduce vulnerable situations such as poor lighting, shrubbery to conceal items or people, or relocating electrical devices such as computers off the floors, especially on lower levels. Identify and correct any situations that increase hazards, such as crossing a busy street to go to an assembly area or if the assembly area located next to flammable material storage.

Employee behavior at assembly areas is also something to consider ahead of time. If there are delays in returning back into the office, determine

if are employees free to wander or if they must they remain in place. Another potential problem to address is smoking at the assembly area while people are waiting to go back in. While people are waiting or are nervous, they are likely to light up outside. If there are any flammable materials involved, this can turn out to be dangerous. Clear policy and communication regarding smoking during emergencies can reduce issues ahead of time. Typically employees are not on break during an evacuation unless they are given one. Further actions may be necessary, so employees should remain reasonably quiet and ready for further instructions.

## Evacuations and Sheltering

While there is an expectation under the Life Safety Code to evacuate a building in 4 min, it is important to determine if policies and procedures allow this to occur. Not only must people evacuate, but also accountability for employees, visitors, and contractors must be established and reported to the emergency coordinator in case someone is left behind. Determine how you will account for employees and visitors, and perform it until it is flawless. The more employees practice, the more reality will impose and identify any wrinkles in emergency plans. Take the time to do after action reviews to identify problems, address deficiencies, and improve response.

Employee identification is becoming more commonplace nowadays. Perpetrators have pulled the fire alarm and then entered the building with the rest of the employees returning. Checking everyone for identification upon reentry should also be considered.

Identify multiple off-site shelter areas to relocate personnel from potentially damaging weather such as rain, cold, or high winds. The building next door is a great idea if it is large enough to hold employees and the building is also not impacted. If this is a larger community event, such as flooding, buildings nearby may also be impacted along with many of the streets across town; so a location out of the area should be found as well.

If severe weather like a tornado hits or there is chemical infiltration into the building, a plan and procedure is needed to protect people inside. Determine safe areas within the building people can move to. For severe winds and tornados, people should be moved to the lowest areas of the building away from doors and windows, so debris does not break through causing further injuries. Consider how to notify occupants and assist those with special needs. These plans need to be practiced to determine how long will it take to get everyone there and identify any bottlenecks that occur and if successful accountability is achieved. There must be provisions in place to quickly shut down air handling systems to avoid drawing in or spreading airborne contamination through the building. This must also include who is responsible and that proper access can be gained quickly.

Practice for these basic response steps is necessary and can point out challenge areas or conditions that need to be streamlined. While most people conduct drills on a sunny day, the reality is it may be raining, snowing, or very hot or cold. Start out simple, but be prepared for bad weather.

## Emergency Communications

It is necessary to determine how to communicate with employees, customers, and vendors before, during, and after a disaster. Establish notification and communication methods to activate your location emergency action plan team and to provide information to people in the building on-site and off-site. Develop and maintain lists of employees, partners, customers, vendors, contractors, and repair services for the physical plant. Include multiple ways to contact individuals, especially during off hours. Consider programming the numbers into cell phones.

Evaluate the existing physical communication systems that can be used to reach others, intranet home page, hotline, bulletin board, password-protected Internet site, or emails, and determine if it is acceptable (Lockwood). The communication plan must clearly spell out who is authorized to create and approve these messages. Have approvals in place ahead of

time for all notices. These systems must be immediately accessible, 24/7 by those who are authorized. Emergencies do not pay attention to work schedules. Considerations must include how long does it take to sign in, create your message, and send them. Regular testing will verify how quickly messages will be delivered. A message to evacuate is not very effective if it takes 3 h or more to reach the approver and get an answer. Consider a mechanism for recipients to confirm receipt of the message, so it is clear the message went out and was received. Be sure to test the system at different times of the day, from both inside and outside of the facility to ensure it works. Develop back up methods for access and delivery. The sender should include their contact information in all messages to verify when and how it was sent. All employees authorized to deliver messages need to practice regularly and frequently. Passwords fail, firewalls can block access, and multiple users during a crisis can bog down systems. Anticipate these problems and plan accordingly.

Communication messaging related to an emergency should be clear, with information on both the situation and direction for what actions people should take. People are more reluctant to comply with suggested emergency measures that are vague or incomplete (Perry and Lindell). Using multiple delivery mechanisms will ensure people receive the message and promote the urgency for compliance. Use as many methods as possible and practical for the situation.

Also, make sure communication works between team members when responding. When coordinating an evacuation or other response, consider the use of handheld radios. Test them out before purchasing if possible to ensure they work in all areas of the building or if a repeater is needed. Ensure there is enough and maybe a spare or two in case one breaks. They must be charged and periodically tested to ensure they work and staff maintains competency in using them. Radios can either be assigned to team members or kept in a designated location. There are pros and cons to both. Especially in large buildings, team members need to reach each other and the leader; situations can change and everyone needs to both give and receive critical information quickly. Ultimately communications relies on tools. Ensure people have immediate access to the tools needed.

## Alternate Locations

If you do direct employees to alternate locations, they must know where they are and how to get there. Policy should address additional travel time and how expenses are reimbursed. Don't assume employees know where the alternate locations are or how to get there. Directions should be published and given at the time of the notification to avoid confusion.

Another factor to consider is transportation issues for your staff, visitors, and customers. Consider if it is too dangerous to drive or if public transportation shuts down, how many employees will be able to still make it in. Many times during emergencies and disasters, local officials will direct the public to avoid all unnecessary travel, so consider what does this mean for your employees and your business. Determine ahead of time if there are critical functions that must continue to serve the public or your customers; the necessary staff needed to perform those functions, and ensure these employees have plans in place at home to ensure family is safe so they can work. If employees must travel, ensure they have identification on them to show they are critical staff and must report. Moving large amounts of people through an area that has travel restrictions during severe weather should not be taken lightly. Consider if existing employees can remain in place until the bad weather is over before traveling. If people do not have to travel during the worst of the weather, try to avoid it.

## Finances

Another critical resource that must be managed during an emergency is money. Develop a plan to maintain financial transactions. Ensure employees can be paid and critical items can be purchased if power or Internet goes down. If banking transactions cannot occur, having cash on hand may be a necessary resource. If employees are unable to

work due to a disaster, determine if they will they be paid or be required to use vacation time. If employees have to work extra hours, be sure overtime policies are clear and are reviewed. Be prepared to address expenses employees accrue for traveling or hotels.

Financial management needs to factor in multiple variables when facing disasters; the more resources and expenses needed will cost more money, leaving the questions of how is it getting paid for. The more answers are determined ahead of time will reduce additional decision-making and stress at the time of the event.

It is also essential to conduct a review of your organizations insurance policies (Shaw n.d.). Verify what types of events are and are not covered and how is damaged goods or lost revenue compensated. Deductibles and replacement coverage are important things to consider. Exclusions for acts of war seem far-fetched, but damages might not be covered from a terrorist event. Make adjustments to policies based on risks, coverage, and ultimately cost, but more importantly know where the organization stands ahead of time. Do not rely on FEMA reimbursement. It is never enough nor is it quick enough to get back in business immediately. Make sure risks are managed.

## Management Commitment

Everyone has heard it is necessary to establish commitment for the emergency management program by the top leadership (State Farm 2015). Senior management must communicate the priority and support needed for emergency management. Create measurements to track performance of departments and employees for participating in training and exercises and reward them accordingly. Employees will see quickly if leadership supports emergency preparedness by their actions as well as their words. If leadership does not support the program, it will most likely not work when you need it to.

## Training

It is necessary for everyone involved in the organization, including leadership to participate in emergency preparedness training. Employees must know their roles (Perry and Lindell). People need to know what is expected of them, what is likely to happen and what the organizations can and cannot do for them (Perry and Lindell). Ensure people understand the information and can execute actions when it is necessary. Therefore, practice should be a part of training. It is also necessary for teams to train together for operability, understanding each other's roles and priorities in realistic scenarios, including community partners on a regular basis (Bond). Provide training, drills, and exercises to develop team competency. Throwing a team of experts together does not make an expert team (Burke et al. 2004). Trust and competencies must be developed together in order for good performance during emergencies.

Determine what professional responders can and will do for your facility in various scenarios during planning. Don't assume the police will search your building if a bomb threat is called in. Police may not even say it is safe for people to return to the building, so work with them ahead of time to determine how this will be handled.

Conduct after action reviews after each drill, exercise, potential, or actual event. Look for what worked well and what needs to be changed. Have a process to ensure corrective steps are taken and assign accountability. While many businesses may rely on 911 to handle emergencies, during a disaster, highest priority calls are taken first, and basic response may be up to facility staff. It is best to be as self-reliant as possible.

## Conclusion

In order for effective emergency management, it requires planning, training, exercising, acquisition of equipment and resources, and the need to include outside partners. Planning is a process of analysis, development, and maintenance of individual and team performance skills achieved through training, drills, and critiques (Perry and Lindell). While this paper has attempted to cover many practical aspects of emergency management, it is certainly not inclusive of all of them. A good philosophy to go by is if it can be planned for, it can be prepared for. Better decisions will be

made when management and responders, both internal and external, can plan ahead by discussing various scenarios, response actions, and outcomes ahead of time. Response will be much better than waiting to make decisions with the pressure of an event unfolding.

Many of the lessons identified in this paper were learned through drills, while some were unfortunately learned through actual events. Take the opportunity to critically examine procedures and expected outcomes now while the sun shines, in order to make emergency management run smoother during a disaster. Practice for real-life events is what makes an emergency plan practical.

# Preparedness to Retire by Malaysian Civil Servants

Singaravelloo Kuppusamy and Shirley-Tan Sok Kit
Faculty of Economics and Administration, University of Malaya, Kuala Lumpur, Malaysia

## Synonyms

Civil servants; Financial literacy; Preparedness; Retirement; Retirement planning

## Definition

Retirement planning involves preparation made by an individual to face life in retirement after the individual leaves employment. This encompasses decisions and actions taken to ensure the availability of sufficient resources to support life after the individual leaves formal employment. Civil servants represent all individuals who are employed by the government. Preparedness to retire shows the adequacy of skills an employee has in taking measures to transit into life in retirement (Nyoro and Otieno 2016).

## Introduction

By each day, more people are enjoying longer life span with improved quality of life. A report by World Health Organization (2018) showed that global life expectancy has increased gradually over the years from an average of 66.5 years in 2000 to an average of 72.0 years in 2016. United Nations (2019) reported that one in six people in the world will be over 65 years old by 2050

compared to one in 11 in 2019. These figures are alarming as they imply that the world is inevitably moving toward aging population and much debate continues on whether the world is ready for it.

To address the socioeconomic needs of older population, most countries have set statutory retirement age where individuals reaching a certain age will be eligible to receive old-age benefits in accordance with national laws and regulations. Globally, there are countries without statutory retirement age while some other countries impose flexible retirement age by gender and type of labor. Countries such as Canada (the Ontario's Human Rights Code 1990) and the US Equal Employment Opportunity Commission (Age Discrimination in Employment Act 1967 (Amendment 1986)), for instance, do not set any mandatory retirement age in support of age equality in employment.

In anticipation of retirement, it becomes a growing concern for an individual to secure adequate financial protection to support life in retirement. However, the significance of proper financial management and retirement planning may not be well addressed by the people since it is often perceived that retirement planning is personal-choice dependent (Grace et al. 2010).

Civil service in most countries can be regarded as the largest employer. Any policies and regulations introduced by the public service shall have extended impact on the civil servants and the general public as a whole. It is notable that social security packages and schemes affect the well-being of everyone in the country as the implications of the policies extend from pre-employment till the post-employment phases. In Malaysia, the civil service has undergone development in the social security benefits for its employees. Ever since Independence in 1957, pension scheme and job security have been the main attractions for one to be employed in the government sector. While the retirement age in 1957 was 55 to commensurate with life expectancy then which was only 58 (Fernandez et al. 1975), the government instituted increases in statutory retirement age to 56 in 2001, 58 in 2008, and 60 in 2013. These commensurate with rising life expectancy which was 74.8 years in 2013 and 75 years in 2018. With that, the Pensions Act 1980 (Act 227) stipulates that an employee shall retire from the public service when he/she attains the age of retirement of 55, 56, 58 or 60 years. The option to choose the retirement age is left to the employees to decide when the government introduces a new statutory retirement age. Besides, there is also flexibility in allowing the employee to opt out of employment in the civil service without losing his/her pensionability, provided a formal application is made at certain age and subjected to approval of the authorities. Unlike in say 1957 when the average life in retirement is only about three years, it currently spans about 15 years. With this prolonged time in retirement, there is strain on their funds including savings that are likely to be used to manage their deteriorating health which often involve costly treatments.

Employees in the private sector are subjected to monthly contributions in the Employee Provident Fund (EPF) scheme while the employer contributes a certain proportion determined by the government. Unlike this, contribution into the EPF is only performed for the first few years for employees in the civil service, beyond which they are moved into the Retirement Fund Incorporated (KWAP) under the Retirement Fund Act 2007. This, however, excludes the armed forces. Once moved into this scheme, only the employer contributes into KWAP which dispenses pension once the employee retires. Occasionally, due to erratic changes in policies, there are instances when new recruits into the civil service are only offered the EPF scheme.

This entry discusses the key factors that contribute to the preparedness of Malaysian civil servants to retire.

## Preparedness of Civil Servants to Retire

Among civil servants, there is a general view that the pension they will receive upon their retirement will be sufficient to meet their needs. As such they believe they could sustain their life in retirement with their pension. A study by Singaravelloo, Abdul Talib, Mohd Kamil, Yong, Abdullah, and Mansor (2020) on preretirement civil servants of support staff category who are still in service find that they are confident that their pension would be

sufficient to sustain them in retirement. However, 60% of them were unsure about the actual amount of pension they will receive in retirement. Furthermore, their study also finds that there are little individual efforts to strengthen their spectrum of financial sources to prepare them for life in retirement. Using a Retirement Preparedness Scale, UPM (2018) finds that civil servant respondents will only set their retirement goals when the time is ripe, indicating the subject as being given less attention. The same study also noted that the pre-retirees only save occasionally. Singaravelloo et al. (2020) also find that almost six in ten respondents are ill-prepared to retire. Preparedness of the civil servants to life in retirement is dependent on various factors such as financial literacy, effectiveness of employee's retirement planning, and awareness about retirement.

### Financial Literacy

Financial literacy has been broadly defined by many scholars and there is no one universal definition on it. The term "financial literacy" is often used interchangeably with financial knowledge as it is commonly understood that individuals who are financially literate have financial knowledge to help make better economic decisions especially when the knowledge was acquired at a younger age. The OECD reported in 2015 that those with low financial literacy generally lack understanding of the need for retirement planning which often lead to delayed retirement or poorly managed life in retirement. Financial literacy therefore can be regarded as the basic foundation required by an individual to make sound financial planning and decisions. As such, being financially literate allows an individual to plan a manageable life in retirement.

As most countries are slowly shifting toward aging population with declining birth rate and improved life expectancy, the progressive change in population pattern is inevitable and this creates challenges in the new millennia particularly on social security. Following this, much of the current literature has emphasized on the issues concerning financial literacy and retirement planning. A number of studies such as by Almenberg and Säve-Söderbergh (2011) and Bucher-Koenan and Lusardi (2011) have found that both constructs are interrelated. A person who retires will not only require sufficient savings for daily consumption expenses but also need adequate funds to cover rising health-care costs, inflation, and other contingent costs which are also expected to rise over time. As such, understanding the concept of financial literacy helps explain individuals' financial preparation for retirement. Lusardi and Mitchell (2011) and Atkinson and Messy (2012) report that employees with low income and in the younger age categories are more likely to be financially illiterate. Level of formal education of Malaysian employees is found to influence extent of financial literacy (Ali 2013). In support, Tan and Singaravelloo's (2020) study on management and professional category employees in the Malaysian civil service found that over 85% of them have good level of financial literacy.

### Effectiveness of Employee's Retirement Planning

Do civil servants plan well to prepare for their retirement? Ideally, retirement planning should start quite soon after an individual enters work force, that is when they are aged around late twenties. However, retirement planning receives little or no importance at an early age. This is coupled with the problem that no one can tell specifically the right sum of funds a person requires to retire in comfort. Each individual may have different retirement needs due to different societal background, health concerns, and a series of other factors. Despite the term "retirement planning" is being generally perceived as about old-age problem to be planned while still in employment, any decision made during early years of employment will greatly influence individual's well-being positively in retirement. Often, however, many young employees see retirement planning as not too important to indulge into too soon in the beginning years of their employment. As many civil servants are overdependent on the pension they would receive, Singaravelloo et al. (2020) showed that many are in illusion that their expected income in retirement would be able to meet their expected expenditure.

In fact, the study also showed that a large proportion have no inkling as to what their expenditures would be in their retirement. Combined with little knowledge about their expected pension amount and expected expenditure, their state of financial well-being in retirement is certainly worrying. Nevertheless, the higher the salary, the higher is the tendency to have a good plan that matches their retirement needs (Singaravelloo et al. 2020). As support staff makes the large proportion in the civil service, their meager monthly income can be expected to be insufficient to meet their requirements in retirement.

An individual civil servant's financial planning and social well-being can be made in pre-retirement through a variety of initiatives. These include voluntary and forced savings, investment in the equity market, endowment insurance policies, and participating in annuity schemes. Nonetheless, as described earlier, lower income civil servants do not commit to most of these as they fantasize that their pension they would receive after their retirement would be sufficient. As a result, there is a high likelihood that retirees from the civil service would face serious mismatch between their total income in retirement and expected expenditures. Consistently, Singaravelloo et al. (2020) find that at least half of the current civil servants are likely to look for employment in their retirement. Apart from earnings from pensions and employment, inclusive of those on part-time basis, in retirement, lower income civil servants are expected to explore entrepreneurship, part-time jobs, rental or assets, and trust funds. This is not surprising as the government as the employer encourages its support staff to seek additional income after work without jeopardizing quality of their main work. With such experience, some retirees would easily adapt into entrepreneurship to earn a living in retirement.

### Government Efforts in Retirement Planning for Civil Servants

In civil service, employees in general think that their life in retirement will be well taken care of by the government. How much efforts have the government taken to offer social security welfare to its employees? In most instances, an employee's retirement preparedness is very much dependent on the governmental efforts in helping the employees prepare for retirement financially and psychologically. Existing retirement policies may need to be revamped in order to address different needs of employees.

One governmental effort that could possibly affect the retirement preparedness of civil servants is the timeliness and exposure on the importance of financial and retirement planning provided to its employees. These are reasonably weak in Malaysia. In this context, it is suggested that the earlier the employees are exposed to proper financial and retirement planning, the more ready they will be to retire comfortably. On the extent of exposure, all employees within the civil service irrespective of job grades and position should be given equal exposure on the importance of having proper retirement planning. As soon as an employee enters the civil service, there shall be various approaches provided by the government to assist the employee in making rightful financial decision and retirement planning.

## Conclusion

As the nation moves toward an aging population, the inevitable wave of retirement will change the general nature of society due to the progressive shift in the structure of the labor force. There is a need to consider revisiting current retirement pension system in view of rapid changes in the global population structure while taking into consideration the economic wellbeing of the nation. Various factors could possibly affect an individual's decision on retirement planning, one of which is financial literacy. This is because as an individual leaves employment, the major concern is on whether the individual has sufficient resources to support life. At the micro level, financial literacy affects the quality of life of individuals while at the macro level, having citizens who are financially illiterate will also adversely affect the

economic well-being of the nation. As such, it is imperative for policy makers to institute relevant policies to help raise awareness of individuals to make wise financial decisions in relation to savings, investment, and retirement planning. As part of the social security reforming efforts, it is equally important to consider the implication of widening gap in life expectancy and retirement age by socioeconomic status.

Most countries including Malaysia have retirement systems in place for individuals working in public and private sectors. In general, employees in the public sector get to enjoy a stable monthly retirement pension together with other fringe benefits to cover their expenses in retirement whereas private employees depend on the provision of private retirement schemes, personal savings, and investments. Despite the fact that employees working in civil service have established pension and retirement benefits, it is important to rethink over the need to revamp existing pension system and retirement age policy. Besides, the government recognizes that the provision of pension is an ever-increasing cost to the government causing it to consider whether new recruits should be put into alternate schemes. As an employer, the government shoulders the responsibility to raise the awareness of its employees to equip themselves with the requisite knowledge of financial planning to prepare them to face retirement. This initiative should be made periodically to guide the employees into safe and satisfactory retirement. Ultimately, every individual needs to be socially and financially secure for life in retirement.

# Preparing for Succession, Head and Heart

Debra L. Mitchell
Augsburg University, Minneapolis, MN, USA

## Synonyms

Business transition; Small business enterprise succession; Small business owner departure; Small business owner transition; Small business succession; Succession planning; Succession readiness

## Definition

Preparing for succession is the process the business owner engages in planning to leave the business. This journey includes the owner's personal process of transition from the enterprise as well as the deliberate process of succession planning for the future of the enterprise and its managerial control.

## Introduction

Small business enterprises are important contributors to the global economy across the world. Within the USA alone, small business enterprises comprise 99.9% of all US businesses. They make up 47% of the private workforce (SBA 2020). Small business enterprises are often considered to have fewer than 500 employees. However, businesses with fewer than 100 employees make up 98% of all businesses and have the largest share of small business employment (Small Business and Entrepreneurship Council 2016). Many of these small enterprises are family-owned businesses. Sadly, nearly 50% of small business enterprises fail to survive more than 5 years, and only about a third survive 10 years or more (SBA 2018). In the case of family-owned businesses, only about a third survive from the first to the second generation, and only 10–15% make it to the third generation (De Massis et al. 2008; Ward 2004).

Given their relative importance and contribution to the economy and workforce, it is conceivable that most small enterprise owners would have a plan in place to ensure business continuation in the event the business owner is not willing or able to continue management control as the owner. Historically, this is not the case. Even if the business reaches a mature stage, and success occurs, very few owners plan for the ongoing future of the business. Business owners indicate that succession planning is critical to the continuation of their business, yet as many as 60%–70% owners do not have a succession plan in place. It is troubling that so many are willing to leave the fate of something so important to them to chance (Eliopoulos and Meister 2017; Sharma et al. 2001).

This chapter examines limited succession planning, exploring (1) reasons related to the business, itself, and the aspects critical for its continuation readiness and (2) reasons directly related to business owner readiness and willingness to transition from the business and transition to post-succession life. In both cases, the business owner stands at the center of decisions made related to succession planning. The proverbial who, what, when, where, why, and how questions for succession preparation are left only to the owner to answer. Even though it is the intention of many owners to have a succession plan, and they spend considerable time thinking about it, few actually take the steps needed to adequately prepare (Mitchell 2020).

Despite the volumes of guidance and research regarding business continuation, such advice is only part of the preparation needed for successful succession. Small enterprise owners must also consider the more personal, individual aspects of life and their futures once they decide to transition from the business. This type of personal planning may well be more difficult than the preparation of the business. Letting go of a business that has been an entrepreneurial creation and source of livelihood for years can be psychologically and financially hard for many owners. In many instances, running a business provides meaning

in life. Transitioning from the *known* routine and role of owner and chief decision-maker to the broad *unknowns* of life, post- succession, can be overwhelming. Suffice it to say that preparing for succession is a multifaceted and complex process for the business and the business owner.

There are two fundamental components of succession preparation – the enterprise and the enterprise owner. What are the business readiness and preparation considerations? What is the owner's personal preparation and considerations for transition and life after the business? This relationship between the owner and the business is at the heart of succession success.

## Succession Planning Readiness: Enterprise Considerations

For succession planning to occur most successfully, there are several business aspects that need to be considered. Given enterprise differences, not every consideration is the same. However, several aspects include the following: operation health and effectiveness; regulatory and legal; tax issues; business valuation and assessment; financial health; customer and supplier retention; product and service quality; successor identification and development; and employee considerations. In every component of the business, the owner is likely to play a significant role. This makes enterprise owners critical to the process of succession preparation and implementation.

The process, or at least the actions taken, for approaching succession planning may look different for each business based on unique owner-centric characteristics. Owners wear many hats in the company depending on the business need, their own strengths, and interests. In the early stages of enterprise development, the entrepreneur may function as the owner, operator, and general manager out of necessity. As businesses grow, owner roles change. What they do and in what areas of the company they spend their time may be different from one business to another. For example, one owner may be skilled at sales and marketing, customer retention, and managerial control. Another owner may have experience in operations or finance but is not skilled in the people side of the business.

As the business matures, complexity increases, and the need for specialized and managerial skills may also surpass the owner's ability and capacity (Sambrook 2005). Bringing in outside talent or resources is one way owners address areas of skill or knowledge deficiencies. The most common resources acquired as complexity grows are to add specific employee, contractor, or professional consultant services. The majority of small businesses see the need to utilize tax, legal, and financial services in succession preparation (Mitchell 2020; White et al. 2004). These may be added due to a specific need, or owner's personal preference to have someone else outside the business perform services.

Nevertheless, there is general agreement that the owner role is a position with a great deal of power, influence, and control in the business and that this role is overwhelmingly responsible for the success or failure of the business. Therefore, the owner is in the driver's seat of decision-making regarding business preparation and timing for succession. What owners *think* (head) and how they *feel* (heart) about these considerations lead to planning action or inaction.

Knowing which phase of the life cycle the business is in is a useful consideration in enterprise succession planning. While the number of stages may vary, there are typically four core stages of the business life cycle: a beginning, growth, maturity, and decline stages (Greiner 1998; Sambrook 2005). Yes, just like humans, all businesses do eventually die. Think of the stages of the business life cycle like a bell-shaped curve. However, the number of stages is not what is important. What is useful about a business life cycle model is that it becomes a way to talk about the "state" of the business, which phase it is in, what occurs in each phase, and what changes occur from one phase to the next. In each stage, the firm and leader pass through critical phases of development that lead to the next stage and phase. Each stage is marked by a different type of supervision and control, as well as different approaches used by the leader to achieve business success.

The stages of the life cycle tend to correspond to the age of the business. At some point, the maturity (and presumably success) phase of the organization is reached, and owners can "coast" to some degree. However, at this phase and in every other phase, there will be unforeseen obstacles such as marketplace changes, supply chain disruption, new competition, turnover, or other potential setbacks. Despite setbacks, owners can also decide to continue to grow and expand the business by increasing its resources, leadership, operations, and profitability. This stage of enterprise maturity is a logical point in the business cycle for the owner to begin planning succession while it is likely experiencing success.

There are several reasons that suggest this is a good time to think about the future continuation plans of the enterprise and the exit strategies of the owner who is approaching retirement age or at least thinking about retirement. After several years of growth, survival, and maturity, the business owner has become more financially, operationally, and emotionally invested in the business. Over the course of the business life, the owner has been the one responsible for the vision, culture, management, and decisions of the company which have led to its success (Sharma 2004; Ward 2004). The owner has established a career as an entrepreneur and business owner which affords a certain lifestyle; builds a community of relationships with customers, employees, and colleagues; and forms a personal identity and purpose closely intertwined in the business. Essentially, the business is a life source of sorts – providing financial means for making a living as well as a source of psychosocial well-being.

Given owners are closely tied to their businesses, they may be reluctant to plan for the future of a business that does not include them or includes them in a different and perhaps less significant role. While this is understandable, the very owner who creates the business may actually stand in the way of its continued success and may contribute to its decline (Mintzberg 1984).

The reasons for plateaus and declines in business are numerous. However, one thing is clear: the leader influences the transitions from one stage of the business life cycle to the next. How the owner responds to the variations and the ups and downs of the business cycle has an impact on the continuation and vitality of the business. This is not to say that businesses can't have declines and periods of renewal, but it takes extraordinarily strong leadership and willingness to transition managerial control necessary to support steps toward change. Succession planning is one such action step needed to support business continuation. Preparing the enterprise for the future when it's still operating well, has a healthy financial status, and is a healthy organization would be an optimal time to do it. Yet, owners tend to not only resist planning but also underestimate the amount of time it takes to adequately prepare the business for succession.

While the maturity phase is the logical time to plan for business transition, there is no agreed-upon time period identified as the best for succession planning. For many small business enterprises, owners have a strong desire to have the business continue long after they have left the helm. This can take different forms. The owner may give up management but not ownership. The transition could be to a family member or other selected successor outside of the family. Owners may also decide to sell the business to continue under new ownership. Aside from options to continue the business, there are owners who prefer to have the business close when they decide to leave (Alterman et al. 2020). Regardless of the decision, it takes time to prepare and execute. A rule of thumb is to allow enough time for the smooth transition of the business, successor, and the owner. Ideally, this should start not less than 10–15 years prior to the owner's exit (Lee et al. 2003; Sambrook 2005). Delays in planning may not allow enough time for owners to adequately prepare. Notes from the field indicate that those who do plan spend closer to 5–10 years preparing themselves and the business for exit.

While owners may think about succession planning and have intentions to do so, the behaviors and actions needed are lacking. Unfortunately, if done at all, succession begins in the later maturity or decline stages when business

owners are nearing retirement (Mitchell 2020; Sambrook 2005). Considerations for owner planning and preparation for departure become even more important as aging occurs. The decisions made and actions taken by the owner related to these succession considerations can have a profound impact on the future of the business and owner.

## Succession Planning Readiness: Enterprise Owner Consideration

The owner makes most of the decisions regarding the business as well as their own life choices. Yet, literature tends to focus on the elements of the business in the succession preparation and less on addressing owner-centric preparation of leaving the business and considerations for life without it.

There are biological, psychological, social, emotional, and financial considerations faced by the owner. Age can be a factor in succession preparation. The median age of CEOs in the USA is 52 years (United States Bureau of Labor Statistics 2020). This is about 10–15 years before the social norms of retirement age ensue. However, it isn't until small business entrepreneurs reach the age of at least 60 do more of them have succession plans in place than do not (Mitchell 2020). This may be because owners, as does society in general, associate retirement with a certain age. In the USA, it is expected or anticipated that people will retire in their 60s.

Retirement is viewed as the completion of employment or, more generally, as an ending of career or work life. Age is also associated with life span and human development. Similar to the business life cycle, psychologists have long studied and categorized the human life cycle in stages – stages that start with the beginning of life and continue through growth, development, maturity, and eventually decline and death. These phases are characterized by developments and changes in personality, social roles, biological characteristics, behaviors, and relationship to the world as a whole. They are peppered by both negative and positive elements which are integrated into a person's identity and can influence trajectory and expectancy of life (Lakra et al. 2012).

This later maturity stage of development is often characterized by reaching retirement. Retirement is a concept that carries different meanings to people. However, though the concept is hard to articulate, the systems, social norms, behaviors, and benefits associated with retirement are evident. The age of retirement, as often marked by reaching a certain age, coincides with the dispersion of benefits such as Social Security and Medicare. It is also in this stage that thoughts of mortality, uncertainties, identity, and purpose are common. Perceptions of retirement, social norms related to aging, and the perceptions society holds of retired people are often negative (Robbins 2015). For example, retired people are perceived to be old, greater consumers of resources, and less valuable to society and have growing health and cognitive issues (Mitchell 2020; Robbins 2015). These unfavorable perceptions can contribute to a business owner's reluctance to plan for succession and departure from the business. Contemplating retirement and "letting go" of a business they love can be very emotional and difficult, especially when they still feel they have much to contribute and offer (Aronoff 2011). This makes planning unattractive to many, causing delays or resistance to take the steps necessary for succession to occur. However, those who have positive views about their retirement are more likely to have a succession plan than those who do not (Mitchell 2020).

The impact of personal perception on owner's current life and future life after the business is powerful. It can influence the decisions and choices owners make about their exit strategy. Because owners are as varied, unique, and complex as the businesses they run, it makes the decisions about the future of the owner as important as the decisions about the business. It takes the whole owner – head and heart – to make the choices that will impact the future of the business and the future of the owner post-succession.

The owner's life is centered around the business. Even through the changes in the business and the different roles a business owner plays, the business remains a significant part of the owner's

life. In the case of family-owned enterprises, owners and their families are closely tied to the business. The dynamic of family members involved in the business adds to the considerations and complexities of planning for succession. For one, the owner's desire to have the next successor be a family member may not be reciprocated by family members.

There are good reasons for the owner to keep the business "in the family." It is likely the family member chosen for succession has worked in the business and worked with the owner. Knowing the owners can have difficulty letting go of the business, the family member offers the owner a way to let go more gradually and still have some influence and ownership of the company even if the control is given to the new family member successor. However, less than 20% of the time, do businesses transition to a family member (Alterman et al. 2020). This can lead to family strain, causing the owner to seek an alternate successor who may be outside of the family and difficult to identify. If a successor is identified, the owner's responsibility to train and develop the successor to a level of satisfaction or comfort can also create conflict between the owner and successor. Should a suitable successor not be identified, this domino effect can change the course of the owner's retirement or transition plans and can cause considerable angst for the owner and the family. There can also be expectations and pressure from significant others and family members for the owner to retire.

Another aspect of the family consideration for the owner is that the business has provided for the financial well-being of the family and its lifestyle. As the owner ages and considers retirement, the business is considered a source of revenue for the owner. Small business enterprises do not have the typical retirement planning options and company matches for saving benefits that many larger companies do. Therefore, the business is, for many owners, their financial means for retirement. If this is perceived to be in jeopardy, it may change the owner's timetable and willingness to leave the business or retire.

In addition to the consideration of family and finances, the business provides the owner with a community and network of friends and colleagues. These relationships, both internal and external to the company, have been built over the years. There is a sense of routine, comfort, and social connection that develops with employees, customers, and professional advisors. This social community can be difficult to leave.

Small business entrepreneurs who are considering retirement have likely been in the driver's seat of the business for more than 10 years. They have been the primary leader, visionary, owner, expert, decision-maker, breadwinner, risk-taker, strategist, legacy builder, and the list goes on. For many, leaving the business in the hands of someone else and giving up management control is not appealing. They enjoy working and simply don't want to retire or leave. At some point, however, they come face to face with age and mortality. Certainly, it can be a gradual, descending slope unless marked with significant events that shorten, impair, or end life. Choices, experiences, genetics, environment, and other factors can also impact longevity. The awareness of one's mortality and unknown future can be viewed unfavorably and a deterrent to exiting the business, thereby making staying in the business a preferred option.

Retirement and aging are related and the factors that influence intentions to leave the business are subject to change. It should be noted that while the majority of owners do not plan for the business future, there are owners who do. There are two sides to every coin. Pros and cons are present in every transition. The literature has identified two broad groups of factors influencing intention to retire: push and pull factors. Typically, *push factors* are things that move individuals toward retirement such as poor health, an organizational downsizing, or work fatigue. Generally, these types of push factors are perceived as negative. In contrast, *pull factors* are generally viewed as positive and are things such as a person's interest in seeking retirement, outside work interests, a significant other's retirement status, and caretaking responsibilities (Oakman and Wells 2013). Like pull factors, there are some indicators that suggest those with a more favorable outlook of retirement and future are more likely to plan for

their succession (Mitchell 2020). They have likely given considerable thought to the next phase of life and view it full of possibilities and opportunity.

Owner perceptions of their own life after the business are no less important or influential than the considerations of the business and are interdependent in many ways. Since the owner is at the center of both the business life and personal life, the owner's objectivity in decision-making may be altered. Even with the best intentions for preparing for both transitions, the complicated nature of the relationship and dependencies of each could influence the owner to make decisions that may or may not be in the best interest of either or both. The natural "rub" in the relationship with the owner and the business is to be expected but resolution can be challenging.

## Interdependencies: Relationship and the Rub

The integration of the owner and business is a multifaceted and complex relationship with few threads of widespread agreement. Yet, it is critical for preparation to occur for a smooth and successful transition. At the head and heart of this relationship stands the owner. The business owner chooses the path for the business or at a minimum has influence on the direction of continuation or ending. The same owner is at the center of determining the direction of what happens after the owner leaves the business.

In a perfect world, the owner's desire to retire, if they do, and the state of the business success and health (overall readiness) would be in sync and overlap in a nice congruent manner. This is often not the case. In actuality, the conditions for succession readiness and conditions for owner readiness are not likely to be fully synchronized. This misalignment and uncertainty of how to correct may be a factor in the owner's decision to delay, resist, postpone, or ignore planning altogether. This suggests that some conditions, perceived or real, of either the business or owner are not ready to move forward with the actions of the transition.

Businesses are as unique as the people who own them. However, there are areas of interdependence and relationship common to both. Key areas include professional advice needs, timing, life cycle alignment, family and social influence, and owner judgment. The growth of the relationship and mutual dependency between the owner and the business has likely deepened through the years. The act of decoupling these interdependencies is complex and difficult. The approaches used to achieve this work will be nuanced and different for each entity.

While there is extensive literature that can be used as a road map for planning business continuation, the same guidance for navigating post-succession life is lacking. This lack of clarity and guidance can disrupt the intentions to plan for succession simply because the owner is unsure what the steps are that could/should be taken.

Owners have, at their discretion, the use of professional advice and services to complement or supplement business needs. However, the use of professionals specifically for the purpose of succession planning guidance is not as prominent. This is not to say there are not advisors who can adequately guide the owner on aspects of the transition. Owners certainly have need for guidance on their retirement planning through financial, legal, and tax advisors. However, there is a degree of reluctance to discuss more *personal* questions and issues related to their own transition and future with those same business advisors. This is due to a concern that the "word may get out" that they are considering leaving the business or retiring before the owner is ready to make that decision (Mitchell 2020). This could have unintended consequences which may negatively impact the business or owner. Concerns range from losing employees concerned over employment if the boss leaves, clients may look for another company, competitors may have some type of perceived advantage, and the social community may view the owner differently if they think the owner is leaving or retiring (Mitchell 2020). These perceived concerns may prevent the owner from further preparing for succession.

Preparing for change takes time and planning. Time is something people think they have too

much of or not enough of. When it comes to preparing for succession, business owners may be well served by spending more time planning than they do. Furthermore, even when CEOs do have a succession plan, the time invested in planning for their succession is considerably less likely than the number of years they have been planning financially for retirement. One reason for this is simply that the concept of saving is encouraged early in life. A childhood piggy bank or storage box for saving money, a savings account at a bank, employers who provide company match programs or retirement plans, and even paying into government programs such as Social Security are designed to prepare and save for retirement over time. This disconnect in years of planning may be a reason why small business owners find it difficult to set and follow personal retirement and business succession timelines. Timing may not coincide with financial readiness.

In the life cycle stages, there are no clearly specified years the business or owner spent in each phase. The success of the business may continue for many years, showing no signs of decline and making business transition less of a perceived priority. The same may be true with how many years the owner has before retirement or leaving the business. Therefore, there may be a perception that succession can be deferred. Waiting until the later stage of the owner's life to consider succession may compound the already difficult task of making ready the business for transition by truncating the amount of time needed to adequately prepare.

The family and social aspects of succession can also create tension for the owner. In some cases, the desire of a family member identified to be the next successor is not aligned with the owner's plan. Family members or other close relationships may have a different timetable for business departure and retirement than that of the owner. Retirement and leaving the business are often characterized as specific events or dates which link to age. Yet, retirement and business transition dates do not always align. An owner may desire to leave but aspects of the business are not at a point where the owner can responsibly exit. In addition, relationships of significance to the owner can add elements of stress and friction to the succession planning process. If the relationships within the company or within the personal life of the owner are not in harmony, it may make it more difficult to prepare for the transition.

It is evident that the owner's readiness and the readiness of the business to transition may not sync up in the way that could be helpful for the owner, potentially causing more challenges to overcome. Reconciling the "readiness gap" between owner readiness for succession and business readiness for succession may be an interstice or chasm. Regardless, the readiness gap should be minimized to better position the owner and business for successful separation and transition. This warrants the serious attention and action of the owner. Drawing from personal experience, knowledge, skill, perception, and emotion, the owner discerns the readiness and makes determinations as to when, how, and if actions toward succession occur. Even with the best intentions, if there are perceived readiness gaps, succession planning is not likely to occur. This rub between the conjoining owner and business can impact owner decisions which impact the timing and trajectory of succession preparation and implementation. This can lead to unintended consequences that have various operational, financial, and emotional impacts to people if not addressed.

Understanding the parallel considerations and integrated relationship that exist between the path of readiness for the business and the path of readiness for the owner is a step toward change in the preparation process. The more conventional ways succession preparation has historically been approached are necessary and useful but are not sufficient to make notable strides in successful succession planning. The pathway forward suggests a less isolated and bifurcated approach between the preparation for the business transition and the owner's retirement. A more intentional, integrated approach that jointly addresses the succession preparations of both is needed. The common factor in this approach is the owner-centric influence and control in the exit planning decisions and actions. This approach also extends the considerations for succession past the point of owner departure and includes the planning for post-succession life.

## Pathway Forward

The pathway forward starts with an owner-centric approach that emphasizes readiness assessment, of sorts. The concept of *readiness* is reviewed from the perspective of business owner perceptions, influencers to those views, and the subsequent decisions and behaviors that follow. As previously noted, the relationship between the business owner views of the enterprise readiness for succession and views of personal readiness for succession is laced with interdependencies and peppered with head and heart issues. These dilemmas confronting the owner can feel overwhelming, especially when the intended goal is to uncouple a lifetime commitment of heart and soul given to a business that was birthed, developed, and made successful by the owner.

Since every person is different and no business is exactly the same, it would be impossible to find a process for succession that would work in every situation. Several models and frameworks exist for owners to choose from, but few use them. This may suggest that the issues go beyond just the process and technical aspects of succession planning. Perhaps succession planning starts as a head and heart endeavor – a focus by the owner on what *precedes* the mechanics of succession.

What owners think and how they feel about aspects of the business as well as their own life matters. Not only does it matter, but for intentions to lead to actions, the head and heart need to work together. But what happens when they don't work together? When they don't agree? Does the owner have the self-awareness and ability to assess and address the impasse?

If the owner wants to retire but doesn't think it is feasible, it is unlikely the owner will leave the business. The flip side could also be true. The business is in a healthy state, a successor has been identified, or a plan to sell the business is set – conditions met that the owner perceives would make it feasible to leave. Yet, despite the perceived feasibility for succession, the owner has no desire to give up the business. If either the head or heart is not in agreement on business or personal succession, postponing the necessary actions and behaviors needed to make either happen is likely. However, when desirability and feasibility are both present, the owner decision is less conflicted, and there is more alignment with head and heart. The pathway forward is clear for action!

As simple as it sounds, the process for making decisions for the preparation of owner and business succession is influenced by the perception of feasibility and desirability. The groundwork for this process is informed by human psychology. Intentions-centered theory proposes that behavior can be affected by intentions toward a behavior. Intentions formations are affected through the collective integration of attitudes, beliefs about expectations of important others, and perceptions of control over the behavior (Ajzen 2002).

Adaptations to intention theory highlight the importance of two perceptions – desirability and feasibility. In Shapero's model (1982), perceived *desirability* refers to the extent to which a person feels an attraction toward a given behavior (e.g., starting a business). Similarly, perceived *feasibility* is the degree to which a person feels personally capable of executing a given behavior (Krueger et al. 2000, p. 418). These two types of perceptions are combined with a person's disposition to act. In the case of succession planning, perceptions of feasibility and desirability (as influenced by the owner's set of beliefs, values, significant relationships, and self-efficacy) are factors of consideration in the owner's decisions and actions (Fig. 1).

Perceptions of feasibility and desirability are potentially more meaningful when the owner attaches emotional valence to each, such as favorable or unfavorable. Valence is a way to designate emotions as positive or negative (Shuman et al. 2013). This psychological process for valuation is a simple form of meaning analysis that codes the environment in terms of whether it is good or bad, helpful or harmful, at a given time (Barrett 2006).

Succession planning is designed to meet the psychological and financial needs of the owner (White et al. 2004). The intentions of succession planning are good, though they may fall short of leading owner follow-through to actual behaviors and concrete actions. The valence factor, positive

**Preparing for Succession, Head and Heart, Fig. 1** Shapero-Krueger model of intentions. Reprinted from Krueger et al. (2000). Copyright (2000) with permission from Elsevier

or negative, is assigned by the owner to the desirability and feasibility of retirement and succession. This value assignment provides a way to simultaneously evaluate the readiness of the owner and business readiness for succession at point in time.

Here's how it works. Let's say there is a new government action related to trade which may impact the supply chain and make products more expensive or harder to get. This has a domino effect and may drive up prices along the distribution channel. The owner has a desire to follow through on identified succession planning steps, but the feasibility is impacted due to changes in the marketplace which has negatively affected the financial health and readiness of the business for succession. When feasibility is perceived by the owner to be unfavorable, succession planning is less likely to occur.

Now, let's say the financial health and other aspects of the business are in great shape. The business valuation is positive, and the operations and people aspects of the business are excellent. The business is at a state where the feasibility to proceed with succession preparation seems positive. The owner's identity is wrapped up in so many aspects of the business that it is hard to decipher the business from the owner. The owner loves business and really doesn't want to hand over the reins to someone else despite best intentions to do so. In this example, the owner's desire for succession is unfavorable, even though the succession readiness of the business is favorable. Once again, readiness to move forward with the transition is unlikely.

Psychological preparedness is also associated with how favorable or unfavorable an owner's view is of retirement or succession. The perceived feasibility and desirability of both personal retirement and "retirement" from the business can be hard to reconcile for the owner.

If the perception of life post-succession is positive, owners may be more apt to prepare the business for continuation without them. If they don't perceive life beyond the business favorably, they may drag their feet on preparing for succession of the business and their own departure.

Whatever the reasons, the psychological considerations of the head and heart are influential pieces for the owner to understand when preparing for succession. Just like head and heart, business and owner work best when they work together. Natural rubs and tensions are expected, but if the owner is unable to navigate resolution, these obstacles can halt the process of planning for the future, leading to unintended consequences for the owner and business. If either feasibility or desirability is at odds with one another, steps toward succession planning are unlikely. Succession success for the business and owner is enhanced when the owner's perceptions of feasibility and desirability are positive.

## Conclusion

Many small business entrepreneurs consider succession planning critical to the continuation of their business. They have spent the better part of their lives working to build and grow a successful company. Despite these efforts, many business owners do not have a succession plan and leave the fate of the business to chance.

There are numerous reasons for the limited amount of succession planning. The readiness of the business and readiness of the owner to leave

the business are two such reasons. The owner and the stage of business are fundamental components of succession preparation. The business owner is at the center of decisions related to the strategies for transition. Indeed, he/she is instrumental in navigating the sometimes-conflicting relationship between owner life and business life, and it is this relationship that is key to successful succession.

Succession planning is a multifaceted and complex process. While preparation for succession should take several years, the planning process is often truncated or delayed due to business readiness concerns or owner readiness issues. The business has likely been a source of financial security, sense of purpose, and emotional connections. Leaving the business involves head and heart decisions, which when integrated produce the best outcome.

The owner's emotional state and financial readiness must align with the business life cycle and prevailing internal and external conditions. The desires of a succession plan must reach an accord with its feasibility. When this occurs, both the successful business and its owner can move forward. The successful owner now has the freedom to choose "what's next" in life. . .head and heart.

## Preparing the Population for an Aging Society in Thailand

Narong Kiettikunwong
Research Group on Local Affairs Administration and Smart City, College of Local Administration, Khon Kaen University, Khon Kaen, Thailand

### Synonyms

Aged society; Aging society; Elderly

### Definition

Due to the increasing trend of growing numbers of elderly citizens in Thailand and the problems arising from the elderly not being adequately prepared, the restructuring of the foundations of governmental schemes to equip "soon to be elderly" generations is very important.

### Introduction

Thailand's population structure has changed to that of an "aging society" since 2005 and is expected to become an "aged society" (i.e., an aging rate over 14%) by 2021. With an aging population at present of 13 million, or 20% of the total population, this situation is already leading to problems in terms of economic, health, and social issues, so it is a challenge for the country to be prepared to cope with quality aging. Thailand, as most other medium-high developed countries around the world, must prepare in three areas: finances, health, and society. Financial preparation requires the creation of income guarantees, i.e., savings during the working years that are sufficient for living in retirement or old age. Proper health requires the need to create healthy behaviors that are appropriate for all ages, prepare individuals to accept change, and plan a valuable life based on self-reliance. The societal aspect includes family support and help from communities and society.

### Royal Thai Government Response

The Royal Thai Government (RTG) has realized how important the effects of population aging are, and policies and measures have been formulated by the Office of the National Economic and Social Development Board (NESDB) since 2009. Guidelines on a strategic drive for integrating the elderly were designed by the NESDB and many other related parties in order to promote a proactive approach, with the main concepts being human resource and social protection development. Consequently, all Thai government sectors are, in practice, engaged in supporting this initiative, e.g., in providing personal training programs on financial literacy, developing welfare society in order to ensure security for all Thai citizens when they get old, etc. In the NESDB Guidelines, the NESDB has proposed four points for an operational framework for supporting the elderly: (1) strengthening income security by promoting financial savings for people of all ages as well as promoting the potential of the elderly in terms of "social wisdom"; (2) developing a social welfare system so that it becomes extensive and sustainable, with cooperation between all sectors; (3) creating an appropriate living environment for the elderly; and (4) developing management mechanisms for the elderly at regional and local levels, as well as developing and connecting databases and knowledge bases to promote the potential of the elderly.

## Quality Elderly (Active Aging)

Quality elderly are people who have the potential and ability to be productive while aging but, at the same time, bringing the concept of successful aging into consideration because the elderly need to face various situations in a holistic manner. Therefore, quality elderly are people who take care of themselves (self-care), can rely on themselves (self-reliance) to do what they want according to their potential, benefit others and society, are satisfied with life, and prepare for the changes that will come (Yotphet 1999).

The components of quality elderly are (1) having the potential and ability to be productive while aging; (2) providing self-care by creating security for themselves; (3) being self-reliant by maintaining a good quality of life in terms of physical, mental, social, and intellectual aspects in order to do what they desire; (4) being able to benefit others by engaging with society for as long as possible; and (5) being satisfied with the current life and preparing for coming changes.

Preparing for becoming elderly means planning one's life with the objective of becoming ready to prevent crises during one's latter years (Wattanawong 2004). Aging changes various aspects of life, and people should be prepared in advance to make life in old age happy. There are several aspects to this preparation: economic preparation by preparing for self-income, evaluating income-expenditure, preparing to save money in reserve, preparation for illness, and completing a will. Health readiness should be considered by seeking knowledge about health education, eating foods that are nutrition-based, and regularly exercising. Housing should be renovated to suit the condition of the elderly. Social readiness consists of a vibrant social life in order to maintain optimism.

The Thai Department of Health, Ministry of Public Health, also defines a quality elderly society as a society that has 10% or more of the population aged 60 years or older and where the elderly still maintain their creativity; are able to do what they desire according to their potential; benefit others and society; are satisfied in their present life; have good physical and mental health; are financially prepared, including housing; and participate in social activities.

A study on aging and preparation before entering old age (Kiettikunwong 2018) suggests that factors that influence the well-being of the elderly are age, education level, health status, income, marital status, education level, time spent in the community, knowledge of financial management, housing that is suitable for the elderly, and the rights of the elderly. In other words, people who are properly prepared in these aspects have been found to be happier with life after retirement. This confirms studies previously done (Akkharaseni 2006; Sodon 2009) which identified that preparation for old age should be more focused in the areas of education, housing, debt amount and savings, relationships with family members, and health.

## Obstacles on Tackling the Aging Society Problem in Thailand

Many aging society countries have formulated elderly care policies in terms of welfare, medical services, medicine, and life security. In addition, to improve quality of life for the elderly, learning services and social preparation in terms of understanding, attitudes, and elderly treatment should be provided by the government at all levels in order to ensure that people will be able to adapt and live happily while aging (Kantavong 2014). However, it was found that the majority of the Thai population (52.4%) lacks proper preparation for their lives after retirement, especially as regards well-being and financial aspects. To address this, government has to be more responsible for elderly care. Although the Thai central government has authorized local administrative organizations (LAOs) to take responsibility for elderly care and to appropriately accommodate them, neither the central government nor LAOs are able to respond to the needs of the elderly (Jitpimolmas 2016).

LAOs, therefore, have a responsibility to meet this urgent need to create a preparation process for

the aging population, especially the working-age, pre-aging, and older people who have not yet planned for the future. These people need to have a good understanding of the requisite systematic preparation and concrete practices in terms of health and finance. To address this, issues regarding preparation of the population for the aging society and development of life quality for the elderly should be emphasized in municipal planning. This responsibility corresponds with the 2nd National Plan on the Elderly B.E. 2545–2564 (2002–2021), which states that family, along with the community, is the first unit to support the elderly to be able to live in the community with a high quality of life.

Based on the report of the situation of the Thai elderly that the National Elderly Committee (NSC) has conducted every year since the enactment of Elderly Act in 2003, there is a trend indicating that the elderly are facing a poorer quality of life for low-income elderly (Office of the Permanent Secretary et al. 2015). The empirical data suggests that the development of the quality of life for the elderly should be focusing on preparing the population to support the aging society as well as drive policy recommendations to support the aging society in accordance with policies and measures to support the aging by the government. This can be achieved by using cooperation between various sectors to enable the elderly to have good health and be able to live with dignity. The empirical data further suggests that the preparation of the population should be in three dimensions: first, the health dimension, including addressing various risk factors such as alcohol and smoking, promoting physical activity, caring for the elderly with long-term dependence, and caring for the elderly with dementia; second, the social dimensions such as the development of potential and the expansion of elderly associations, promoting learning and developing appropriate courses for creating quality elderly who are energetic and able to take care of themselves; and finally, economic dimensions such as supporting academic work to drive the strategy of employing older people to create opportunities and extend the age of employment for older workers and working with the policy sector and local communities, which currently have prototype areas (e.g., Khon Kaen Municipality) for the development of the elderly care system by using the community as a base both in local communities and in over 300 urban communities (National Statistical Office Ministry of Information and Communication Technology 2014).

## The Foundations on Preparing to Enter the Old Age

More than half of the Thai elderly are not prepared to become "quality elderly," although most seniors see that preparing for the old age is important. It was found that even though Thailand has a high level of readiness in terms of housing and social aspects, health is at a moderate level. As for the economy, it was found that the preparation was low. Although currently only one fifth of Thai consists of the elderly, the pre-retirement population (40–59 years old), which accounts for nearly 50% of the total population, will slowly be joining the aging society over the next 20 years. Thus, to prepare for and cope with the problems of the aging society, which can involve high levels of expenses on the part of public budgets, proper preparation is needed for this segment of the population.

The increase in urbanization in Thailand causes changes in family structure; in other words, the interdependence level is lower. This change can greatly affect the quality of life among the elderly in terms of livelihood management, health care, and finances. Therefore, preparation of the population for the aging society is important, because the more prepared the people are, the more satisfied they are with their lives. Conversely, a lack of preparation leads to low levels of life satisfaction.

According to many research results done by government, academia, and other agencies, the majority of elderly people were still not very satisfied with current preparation of the population for the aging society. The issue of health needs to be prioritized in terms of delivering it which will correspond to the public's needs. Furthermore, Thailand needs to provide other

types of preparation for people, such as housing, methods for building good relationships, and management of leisure activities. Moreover, Thailand may need to consider placing additional importance on financial literacy, e.g., financial planning, savings, investment in both capital and money markets, and education on insurance in areas such as health insurance. The preparation should be provided based on age and conducted before old age arrives. In other words, preparation should start not later than the age of 40 because health and financial preparation cannot properly succeed and be effective if delayed for too long after this age. Additionally, there are several recommendations that should be helpful in laying solid foundations to cope with the inevitably aging society and aged society.

1. Most of the people of all ages agreed that preparation of the population for aging, particularly in terms of health issues, is very important because the elderly tend to face more health problems than those of other ages. They still experience the problem of access to health services, and they regard medical fees as expensive. This preparation should begin with those in the age range of 40–59 years.
2. Currently, there are a rising number of people who are generally satisfied with the preparation process for the aging society thanks to the various programs and activities arranged by the RTG and LAOs. Nevertheless, educating people to have more financial knowledge, as regards savings, investment in both capital and money markets, and choosing or buying the right type of insurance, should be enhanced in order to improve people's satisfaction with the preparation process.
3. The Ministry of Social Development and Human Security (MSDHC) is regarded as the main mechanism for improving the quality of life of the elderly. At the local government level, the Department of Social Development and Welfare is the key mechanism to implement programs and activities based on the needs of citizens, for preparation to enter retirement age, and other social welfare development programs based on national policies and MSDHC initiatives. Thus, a specific intermediary agency, founded specifically for the purpose of improving quality of life, especially in the elderly, should be established. This agency should have the following three important roles:
   (a) Serving as a liaison between the private and public sectors (based on the concept of a civil state), including being a facilitator and information center for the elderly.
   (b) Creating a database or "Big Data" of the elderly by collecting data through field surveys in order to acquire timely and accurate data, which will allow the administrative team to formulate appropriate policies to satisfy public needs, which is in line with Thailand's current Big Data policy.
   (c) Sharing timely and accurate information with the LAOs and community in order to expand public participation in promoting the preparation process for the aging society.

# Presidential Policy Agenda in Latin America

Miguel A. López[1] and Nicolás Miranda[2]
[1]Institute of International Studies, University of Chile, Santiago, Chile
[2]University of Salamanca, Salamanca, Spain

## Synonyms

Agenda-setting; Congress; Executive power; Latin America; Presidentialism

## Introduction

Latin American presidentialism is characterized by head of state faculty to define or, at least, strongly influence the policy agenda. Although presidential powers vary from country to country; the president is one of the main actors in the public policy agenda setting. This agenda begins to take shape with the presidential manifesto, also known as government program, the candidate presents during the electoral campaign. Once elected, the manifesto becomes an actual roadmap for the newly elected authority, especially when it comes to keeping promises made during the election campaign. Since program compliance becomes an accountability indicator for a new government, modifications or updates are made public during the annual speech before the plenary session to the Congress (a protocolar act equivalent to the American State of the Union Address). Similarly, the president's actions and statements to the press have a strong impact on the mass media, affecting not only media agendas, but also public opinion in general. Nevertheless, presidents' faculties to turn their agendas into law and enacting their presidential programs depend mainly on the interactions with the legislative branch.

Unlike the scenario in the United States, where there is a longstanding tradition of studies on president' faculties to set and/or influence the policy agenda, in Latin America studies on this subject are extremely rare. Although there are several specific policy analyses at a country level, a large part of these comparative studies has focused on the decision-making process and the interactions/negotiations among different actors in the parliamentary arena. Even more, most of this research has been overshadowed by political science, especially under the umbrella of the relationship president–congress, focusing mainly on the president's legislative power.

## Presidential Pre-legislative Agenda

Broadly speaking, the agenda setting is "the process by which problems and alternative solutions gain or lose public and elite attention" (Birkland 2007: 63). More explicitly, "the process by which information is prioritized for action, and attention allocated to some problems rather than others" (Jones and Baumgartner 2005: VII–IX). The agenda setting is a process, where a large number of political, social, economic, and governmental actors, among others, seek to embrace topics of their interest with the aim of becoming the object of government action. The actors' ability to turn their demands into priorities as part of the decision-making agenda can make a difference in what will, or will not, become a specific public policy. In that sense, the president, the

government, as well as the congress are constant addressees of demands from different sectors for them to include particular issues on their agendas.

In this short entry, we will understand the presidential agenda as a signal indicating "what the President believes to be the most important issues facing his administration" (Light 1991: 2–3). Or, more specifically, as "a list of hopes for the future, some of which become law, others of which languish for a lack of support" (Light 2004: 2).

As Cobb and Elder (1983) acknowledge, there are two types of agenda setting. The broadest and most abstract is the *systemic agenda*, which includes all issues members of the political community commonly perceive as meriting public attention. On the other hand, the *institutional or governmental agenda* refers to those matters of interest political institutions seriously consider as appropriate measures and actually act on them at a given moment. Latin American presidents are important actors on shaping both agendas. As Wood (2010) points out, in the case of the United States, presidents are "symbolic representatives of the nation" and voters expect from them the ability to recognize society's problems and offer solutions. At the same time, they are expected to be able to provide effective public policies in general, to be good administrators and managers, and to generally provide order and prosperity to the nation. As heads of state and government, presidents are the most visible and important political actors in presidentialism.

In Latin America, the president's capacity as an "agenda setter" begins during the electoral campaign, prior to the elections. Presidential candidates and/or their supporting parties usually present an eventual future government's program with a series of public policy offers which, if elected, is expected to be implemented in the form of policies. These manifestos vary in length and detail by country, but also differ at an internal level within each country depending on different factors, such as candidate style and party tradition, among others. In general, presidential candidates from large parties with real possibilities of being elected tend to elaborate extensive manifestos covering mostly all public policy areas. Most of the research about future government programs in time of elections for Latin America comes with the extension of "Manifesto Research on Political Representation" (MARPOR). Despite the fact that party manifesto studies political parties, in Latin America, research has been extended to consider presidential manifestos (Ares and Volkens 2017) to estimate policy priorities and positions in presidential political competition. The main objective is not to study agendas themselves, but rather the spatial positioning, especially on presidents and/or parties in the left-right axis based on their positions on public policy issues. These analyses have been carried out mainly in Chile (Gamboa et al. 2013; Mella et al. 2019), Brazil (Tarouco 2011), Argentina (D'alessandro 2013), Mexico (Martínez-Hernández and Martínez 2017), and in comparative perspective (López et al. 2013).

Since voters usually do not read these extensive manifestos, much of the information they receive from the candidates comes from the media and the electoral campaign itself, especially when the campaign message is policy-focused. In the last years, social media – especially Twitter – have taken a leading role in the public policy agenda dissemination (López-López and Vásquez-González 2018).

Once the president takes office, he/she will have nonlegislative and legislative powers to carry out the government agenda. The first presidential faculty describes the administrative approach through which governmental offices/units and other public services depending on the central government can directly implement certain policies. The second capability refers to a legislative process, which implies the Congress approval ending (or not) with the implementation of laws (Payne 2006: 95–96).

Unlike North American presidentialism, there is limited analysis of the Latin American executive branch and the resources of the presidency. In general terms, the executive branch is headed by the president and is assisted by ministries or secretaries differentiated by specific areas, who advise the head of government in their subjects of competence. The ministries council, commonly known as "presidential cabinet," is an important collective actor when it comes to achieving the

presidential agenda, mainly because ministries are responsible for the implementation of most of public policies, especially those coming directly from the president through executive orders. Although the cabinet's number, size, and political responsibilities in fulfilling the agenda have increased in the last decades, its participation in the decision-making process varies from country to country, and even from one president to another.

A fundamental act in determining priorities on Latin American presidential agendas is the head of state's annual speech to the congress. In this speech, citizens are informed and updated on the nation's administrative and political situation. During this protocolar act, achievements made by the current administration are highlighted. Public policies planned to be implemented are also announced. This speech, which has extensive media coverage, is an opportunity for the president to gain support for the executive's course of action in all major areas of public policy. Given that these speeches are delivered annually, they constitute a source of information on the presidential agenda, facilitating comparative studies over time and between countries (López et al. 2011; Arnold et al. 2017; Brasil et al. 2020).

## Presidential Legislative Agenda

Generally speaking, there has been the belief presidents dominate the legislative process and the political agenda setting in Latin American presidential systems. Some authors have highlighted the importance of Latin American president's figure in the legislative process, pointing out that congresses are more reactive to executive's bills than proactive in the formulation of laws. Cox and Morgenstern (2001) highlight that congresses, or legislative assemblies, do not have the faculty to be generative (form and remove governments) or proactive (promote or sanction laws), becoming rather reactive by modifying or vetoing proposals coming from the executive (2001: 373).

However, this view is no longer dominant. Recent articles have added new dimensions to the legislative agenda analysis, where Alemán and Tsebelis's (2016) research stands out. In their comparative study, they state parliamentarians considered as a collective present a more significant number of bills than those sent by the president.

The presidential system structure is relevant for the democratic system and its capacity to effectively adopt and implement specific public policies, such as its legislative agenda. In the Latin American region, structures and presidential systems' operation are diverse: "whereas in some countries the design of the political institutions helps to foster the crafting, passage, and implementation of public policies which work to advance economic and social development in the country, in others suboptimal institutional arrangements often undermine development efforts" (Jones 2012: 30).

The initial approach to the president's role analysis during the legislative process has been institutional; and specifically focused on the powers granted to the president and legislators by the constitutions and regulations. Despite differences between countries, the faculties granted by the constitution to the head of state can be divided into two. On the one hand, those related to the legislative process and, on the other, those associated with the capacity to appoint ministers and other authorities (Payne 2006: 95). President's legislative powers can be summarized as follows: (a) the exclusive power to the president to introduce legislative initiatives in some specified areas; (b) faculty to veto bills; (c) legislate by decree; (d) a degree of control on the legislative agenda; and (e) the faculty to dissolve the legislative branch during his/her constitutional mandate (Shugart and Carey 1992; Payne 2006; García Montero 2008).

The presidential veto is the "mechanism by which the president rejects or make comments on a bill or decree approved by the legislature" (Zovatto and Orozco 2008: 35). Two aspects of the veto process are the most relevant to understanding presidential power in this arena. Presidents have the power of vetoing a bill in whole, in part, or both. In the first case, the president can only veto the entire Congressional-approved bill, while in the second, the head of state has the

possibility of removing specific articles/sections. The specific effect of this power is the promulgation of articles that the president does not object to (Payne 2006: 99–100).

In all Latin American countries, presidents have the faculty of a total veto. However, not all presidents have the power to make partial vetoes. Given the president's greater room for maneuver, this type of veto reinforces presidential power over the legislature by allowing him to intervene in the bill, either by stopping changes to the status quo or by introducing issues on his/her own interest (Payne 2006; Jones 2012; Alemán and Tsebelis 2005, 2016). It is necessary to keep in mind that not all countries assign this power to the president. Likewise, some constitutions also allow a presidential veto overriding if the legislature insists on the original version, for which a quorum is required according to each constitution.

Latin American constitutions also empower the president to legislate without having to go through the congress, giving him/her greater possibilities to carry out his/her legislative agenda. Presidents can legislate using three mechanisms: a) decree powers, b) emergency powers, and c) legislative delegation. Among all three, decrees are the most important ones, because they can become law without passing through the Legislature (Shugart and Carey 1992; Payne 2006; Carey and Shugart 1998; García Montero 2008; Zovatto and Orozco 2008). When a president has a strong decree power, he/she can actually modify the *status quo* "to any position within his preference space without taking into account the preferences of Congress" (García Montero 2008: 62).

Emergency powers relate to the executive's faculty to exercise extraordinary legislative powers as well as the suspension of rights and freedoms (individual and collective) in situations of national emergency, such as social and political unrests. This type of power delegation is temporary and has to be communicated to the legislature in order to be ratified (Carey and Shugart 1998). Emergency faculties are considerably variable in Latin American constitutions. These variations consider dimensions such as actors who, in addition to the executive, are involved, conditions under which the emergency can be declared, and limitations on actions taken in emergency conditions (Cheibub et al. 2011). Although this power is often used in exceptional circumstances and has been abused in the past (Loveman 1994), in today's Latin American democracies it constitutes a very rare presidential tool to fulfill the agenda.

In addition to the powers of veto and decree, presidents have faculties, which allow them to set and control the legislative agenda. The first one is the ability to give precedence to specific bills by classifying them as "urgent" to be discussed by the legislature. Urgency has a priority effect on the agenda, as well as on times of legislative discussion and processing. The legislature is forced to process bills in a shorter period of time than in a normal legislative process. While the congress may meet to reject or amend presidential initiatives, this is a mechanism for presidents to force congressional action in case of delay or inaction (Alemán and Tsebelis 2016). The scope of this presidential power will depend on a series of established institutional mechanisms, such as "the amendment capacity that Congress has, the method of approval of the presidential proposal, the matters on which the urgency can be declared or the time limit in which the Legislature must pronounce" (García Montero 2008: 41).

The second, extraordinary institutional mechanism aim to grant presidents some type of control over the legislative agenda is the executive's ability to call the congress to extraordinary sessions in order to deal with specific matters. This power is enhanced to the extent that the legislative power itself lacks the possibility of self-convening during periods of recess, or when that power exists, the quorum necessary to carry it out is very high (García Montero 2008: 69).

All Latin American constitutions grant the president the power of legislative initiative. This power becomes relevant in cases where the president has the exclusive right to introduce projects on specific policy areas (exclusive initiative), making the head of state the most important legislative actor in these subjects. This scenario relegates the legislative branch to a reactive position on these matters, allowing them only to modify what the president sends (Shugart and Carey 1992: 139).

Most presidents in Latin America play a central role on the national budget's elaboration and approval. There are three central elements to this process. The first one is whether the bill's presentation is an exclusive attribution of the president. The second factor is the power legislators have to modify the bill. In some cases, they can modify the entire proposal, while in others they cannot increase spending. The third aspect applies when agreements are not reached on the budget, and the bill is not approved. In this case, in most countries, the previous year's budget remains in effect, although, as Jones (2012) points out, several countries have a rule that, if it is not approved, the bill presented by the president is automatically adopted.

## President's Partisan Powers in the Legislative Process

The president's constitutional powers are a part of the legislative agenda process. Equally important, however, are the president's partisan powers in front of the legislature, the level of polarization of each country's political party system, and the degree of response or discipline of the legislative contingent of its party or alliance (Jones 2012: 27). The interaction of these three factors will influence the president's partisan power in the legislature and with it, the level of ease or difficulty he/she will have to form alliances bringing forward his/her legislative agenda (Jones 2012).

When the president has a clear and cohesive majority, the parliamentarians who support him should be able to move onward the executive's legislative agenda. One of the main concerns on presidentialism studies is the possibility that the president may not have an absolute majority and this fact could lead to a legislative paralysis (Linz and Valenzuela 1997; Shugart and Carey 1992). Faced with this situation, presidents can form coalitions or seek ad hoc agreements for specific projects. Alemán and Tsebelis's research shows that, when presidents do not have that parliamentary majority, they should seek support from small parties, independents, and dissidents from the opposition to support their bills and thus avoid blockage or paralysis. But there is also the possibility that legislators close to the president may "amend presidential bills in order to respect the preferences of congress" (Alemán and Tsebelis 2016: 225–226).

When the president has a cohesive and disciplined legislative majority, he/she has no major problems turning his/her bills into laws. In this case, the level of party polarization has no significant relevance. However, when the head of government does not have a majority, polarization starts playing an important role in this process. When polarization is low, there is a greater likelihood of forming and maintaining legislative coalitions. However, when "high levels of ideological polarization exist, the barriers to forming coalitions are much greater, and the costs (in terms of payoffs/side payments) much greater" (Jones 2012: 29).

Cohesion or discipline within the party (and the coalition) is also important for the president to succeed with his/her legislative agenda. A disciplined contingent allows the legislative process to be expeditious and without further surprises. On the other hand, when there is no such discipline, they are forced to negotiate and, in some cases, compromise some specific aspects of the initial project, accepting suggestions from the legislators in order to pass the bills the executive is seeking to enact. Jones (2012) explains that this situation varies significantly in Latin America, both between countries and within each government.

There are other elements to highlight about the president's legislative agenda. Firstly, bills presented by the executive are less numerous compared to the initiatives presented by legislators. However, those presented by the head of state are more likely to be approved. Likewise, presidential bills' processing and approval times also tend to be shorter than those initiated by legislators. Secondly, the president's legislative agenda tends to attract more attention than congressional bills. Conclusions on Alemán and Tsebelis's (2016) research reinforce the idea that the president introduces "important" bills. This is partly due to institutional prerogatives, such as the exclusive

initiative, which usually relates to areas of great importance. Finally, despite the president's legislative agenda's success, most of the important bills he/she presents ended up suffering modifications by members of congress during the legislative process (Alemán and Tsebelis 2016).

## Conclusions and Directions for Future Research

Agenda setting is the first stage of an extensive process that aims to formulate public policies. Agendas proliferate along with different political, social, and economic actors. In Latin America, one of the main agenda setters at a national level is the president.

Presidential agendas emerge from what presidents believe are the most important issues his/her administration is addressed to face and, in many cases, result in public policy bills. Through this agenda, the head of government establishes his/her own priorities in public policy representing a fundamental element of political leadership.

Setting the presidential agenda is a long process, beginning with the presidential candidate's government program. Once the elected president takes office, the program is called to translate into bills sent to congress for approval. Finally, bills enter the legislative stage to be discussed by the legislature. Presidential agenda's timing is, by no means, static as policy makers – including the president – are constantly bombarded with information on multiple potential policy subjects. In developing countries, such as the ones in Latin America, issues are multiple and resources are especially scarce. The battle between various political, social, and economic actors to get their matters of interest to become part of the governmental agenda is fierce.

Studies on presidential agenda and agenda setting in Latin America have been scant. Generally, there are case studies and analyzes on specific public policies, but temporal and comparative analyzes are unusual, in part, due to lack of data. However, the extension of the Comparative Agendas Project (Baumgartner and Jones 1993) for Latin America (Baumgartner et al. 2020) offers an opportunity to research trends in agenda setting and policy making over time and between countries.

# Presidential Signing Statements and Public Administration

Christopher S. Kelley
Miami University, Oxford, OH, USA

## Synonyms

Iron-clad item veto; Unilateral action

## Definition

The signing state is any written and/or verbal statement issued by the president when legislation is signed into law. In most cases, the president issues only a written signing statement, but on some occasions, he will also issue a verbal statement to accompany the written statement. As explained below, sometimes the tandem is used to obscure the written statement, which always contains the more controversial provisions.

## Introduction

In the run up to the 2008 presidential election, a seemingly obscure issue was front and center – the use or misuse of the presidential signing statement. Senator John McCain, the presumptive nominee for the Republican Party, and Senators Hillary Clinton and Barack Obama, still battling for the Democratic nomination, were each asked in press interviews whether they would continue to use the signing statement if elected president. The two Democrats, with some equivocation, said

they would while Senator McCain was absolute in his answer that the signing statement was an unconstitutional overreach into the prerogatives of the Congress and the courts.

The reason why such an arcane issue reached the level of a presidential election cycle was a direct result of how useful George W. Bush found the device to help him protect presidential power and to advance his own policy preferences. President Bush had used the signing statement to take control over the legislation he signed into law, either by refusing to enforce provisions believed to be unconstitutional or to reinterpret sections so that it better fit within the Bush policy agenda. One of the more controversial uses occurred when President Bush signed legislation prohibiting the use of torture as part of the Global War on Terrorism. Prior to signing the bill, President Bush met with Senator John McCain (R.AZ) in a very high-profile and public meeting to agree that the USA would not use such techniques as "waterboarding" because it was declared a form of torture, and since the USA was part of the international agreement, it was our obligation to respect the rule of law.

All this changed in the dead of night on New Year's Eve, 2005, when President Bush signed the legislation but then seemed to qualify his agreement with Senator McCain. President Bush wrote he would "construe" the agreement consistent with his constitutional powers. This set off a public firestorm that drew unprecedented attention toward the signing statement, particularly after learning that President Bush used the device to challenge or change hundreds of provisions of laws without anyone paying attention.

George W. Bush certainly was not the first president to use the signing statement, nor is he the last. Though it is not likely that any president will come close to his use of the device, it nonetheless serves an important purpose for the president. For instance, even though Barack Obama issued detailed instructions limiting the use of the signing statement, he nonetheless has found uses for it as well to challenge or control sections of laws that are problematic.

This chapter will be broken into the following sections: the first section will offer a concise history of where/when the signing statement originated as well as how it has evolved; the second section will explain the different uses, illustrated with examples, for the signing statement; and the third section will offer some concluding remarks on the future of the signing statement.

## History

The signing statement is not new. It first appeared in the Andrew Jackson administration, and from that point through the Carter administration, it was used sporadically to protect the president's constitutional powers or individual liberty.

The Reagan administration gets the credit for turning the signing statement into an important tool or device to help his administration move public opinion, to protect presidential power, and to direct bureaucrats in their implementation of the law. Thus, it is the Reagan administration that is the first to use the signing statement systematically to advance the president's position in the lawmaking process, giving to the president enhanced powers to control legislation beyond the simple signing or vetoing of a bill.

And even though each subsequent president continued to use the signing statement much like the Reagan administration, it never really attracted much attention by the media or the academic community. And that was by design – the signing statement, like executive orders or proclamations – work best when it goes unnoticed, particularly by the Congress. This gives the president the opportunity to establish a pattern of usage, so if there is an objection made at some future time, the president can always defend it by pointing to all the previous times it was used without objection.

Thus, it was the George W. Bush administration that provided the signing statement with its official public debut by using the device to negate hundreds of provisions of law – so much that by the time President Bush ended his first term in office, he had used the signing statement to challenge more provisions of law than *all* previous presidents combined!

President Bush, in some instances, used a single signing statement to challenge hundreds of provisions of a single law. As a result, this provoked a number of media stories, which sparked two congressional investigations, a scathing condemnation by the American Bar Association, and in the end the publicity rendered the signing statement as a less than useful device for the next president, Barack Obama, who has issued fewer signing statements of any president from the Reagan administration forward.

## Signing Statement: A Typology

The signing statement is so useful because it serves a variety of purposes for the president. First, it can be used as a rhetorical device to generate congressional or public support for a president's policy or political preferences. The president can identify a couple of key players for their good work in moving the legislation to his desk. On the flip side, the president can use the signing statement to admonish Congress or his opponents in the signing statement in the hope that the media might seize upon the conflict and help move the opposition into the president's corner.

Or the rhetorical signing statement may be a way to bridge an intractable divide between the White House and the Congress. For instance, President Obama made it a priority when he took office in 2009 to close down the detainee facility at Guantanamo Bay, Cuba (Gitmo) because it represented the negative side of the Global War on Terror, from the image of the detainees in orange jump suits to the fact that a number of detainees had been held since the facility was created in 2002 without ever facing a judge or jury. This contradicted American values, according to President Obama, while also serving as a visible recruiting tool to radical Muslim groups such as ISIS or al-Qaeda.

Despite President Obama's wishes, the Congress has engaged in a high-stakes battle over the closing of Gitmo, with the Congress placing sections into defense spending bills prohibiting the president from closing the facility, and the president responds with a signing statement arguing that the prohibitions are a violation of presidential powers. And yet, despite the high drama over the issue, the Obama administration, working with the Congress, has managed to drain the facility of all but 91 detainees (out of 800) as of February 23, 2016 (n.a. 2016). Thus keeping the pressure on the Congress by threatening to act unilaterally, the administration has managed to make tremendous progress in fulfilling a campaign promise to close the facility down.

The second use for the presidential signing statement originates from the president's interpretation of the "Oath" clause of the Constitution. This clause commands the president to "protect and defend" the Constitution as well as the "Office of the President." The "Oath" clause, combined with Article II's "Vesting" clause (which bestows to the president all executive powers), gives the president leverage over the constitutionality of the laws he defends or enforces.

To the average person, a president who refuses to enforce or defend a provision or provisions of law that he signed seems like an imperial act. The common refrain to the refusal to enforce is to ask why the president did not veto the legislation if it was constitutionally troublesome. This would be sensible if legislation only contained a single issue to deal with, but unfortunately most legislation sent to the president's desk contains hundreds of different policy or political issues to which the president can either sign or veto. This creates a lot of opportunity on the part of the Congress for mischief. One well-known area of mischief is in the form of "pork" – legislative riders added to important spending bills that fund the pet projects in the district or state of a member of Congress.

In the same vein, what if Congress added an unconstitutional provision to an important spending bill in order to embarrass the president? In the lead up to the 1996 presidential election, the Republican Congress passed a defense spending bill, over the objections of the secretary of defense, the Joint Chiefs of Staff and President Clinton, that discharged all HIV-positive members of the military. The Clinton administration concluded that the amendment was unconstitutional and refused to enforce it once it went into effect or to defend it if

challenged in federal court. The action of the administration convinced the Republicans in Congress to blink, and subsequent legislation was passed which negated the unconstitutional provision.

In this way, the signing statement acts as a placeholder, effectively freezing unconstitutional provisions of law until the Congress and the president can work out their differences while preserving the president's promise not to knowingly execute or defend law he sincerely believes is unconstitutional.

The final use for the signing statement is of particular interest to those who study public administration. This use allows the president to direct bureaucrats in the administration of law so that the public is technically represented in administrative decision-making by taking away a bureaucrats' discretion to make decisions and placing that authority in the president, the only nationally elected figure in the USA.

To understand how this works, it is important to look at how the presidency since Ronald Reagan has worked to get control over administrative discretion. The Reagan administration, in a series of executive orders, empowered the Office of Management and Budget (OMB) to monitor how bureaucrats were interpreting the law and, with the help of the Supreme Court (e.g., *Chevron U.S.A., Inc. v. Natural Resources Defense Council, Inc.* (1984)), allowed the president to interpret the meaning of the law where the plain meaning is not clear.

The use of the signing statement to interpret unclear provisions of law originates in the president's Article II responsibility to "take care" that the law is faithfully executed. The president, in this usage, provides clear direction to executive branch administrators in his signing statement as to how the law should be interpreted and enforced and uses the OMB to monitor the actions of the bureaucrats.

For example, in 1986 the Congress sent President Reagan a legislation that reformed the US policy toward immigration. One particular provision attempted to protect American citizens who were fired because of their skin color or race, where an employer could claim that the firing was due to fear that the employee was an illegal alien using false identification. In the House version of the bill, the provision was clear in requiring the employer to document the reason for the firing to insure it was for some reason other than discrimination. The Senate did not include the provision in their version of the bill, so it went to a conference committee to work out the difference in order to send it to President Reagan. When the conference committee completed work, the House provision was added, but it was not clear whether the employer or the employee had to prove intent to discriminate.

When President Reagan signed the bill, he "interpreted" the section to mean that the employee had to prove discriminatory intent, something that the House sponsors had not meant, as well as a burden that would be difficult for any employee to prove.

In a similar action, President George W. Bush used the signing statement to commandeer a provision of the "Sarbanes-Oxley" bill that was designed to clean up corporate malfeasance in the wake of the Enron scandal in 2001. President Bush singled out a provision of the bill that provided broad protections to private sector whistleblowers.

President Bush issued two separate signing statements to the law. The first signing statement was a formal, Rose Garden ceremony, where the president praised Congress in sending a message to Corporate America that impropriety would not stand. In his second, written signing statement, President Bush crippled the whistleblower protection by qualifying it as only applying to active investigations by the House or the Senate, meaning that any whistleblower who went public with his or her information in the absence of a formal congressional investigation could be fired from their job.

## Conclusion

The signing statement has been a maligned device that is largely misunderstood by the American public. Some argue that the signing statement is an example of a president who has slipped loose from the Constitution to become a king. Still others make a partisan argument that only focuses

on the signing statements issued by the president from the opposite party.

What is clear is that the signing statement is an important part of the president's impressive arsenal of devices to help him navigate the polarized, gridlocked political system by enabling him to move policy unilaterally when necessary and to protect core constitutional powers.

While the Obama administration has not used the signing statement nearly as much as any of his predecessors (electing to use the executive order instead), nonetheless he has used it when it mattered.

It is important for researchers, journalists, and the public to move past the question of whether the signing statement is or is not constitutional and instead keep the focus on when the president decides to use it and why.

What is important is to understand the underlying dynamics behind the use of any unilateral device by the president, because it is clear that the gridlocked, polarized system has a great deal to do with its use, and given how likely the gridlock and polarization will continue in the future, the use of signing statements will remain an important part of president's overall administration and legislative strategy.

Editorial independence; Free press; Freedom of speech; Media regulation; Representative government; Sound governance

## Definitions

| | |
|---|---|
| Press Freedom | This is the legitimate right of persons and the press to hold opinion and impart ideas and information without government restriction. |
| Democracy | It refers to a popular government where everybody is involved in governance through the representation of elected persons in office. |

Press Law This is the set of laws that is made by the government to regulate the conduct on activities of the press toward state protection.

## Introduction

Press freedom is strongly connected to the freedom of speech. This inextricable linkage between these two variables indicates that freedom of speech or expression is a fundamental human right. In virtually all settings, press freedom has a theoretical foundation (NOUN 2017). Press freedom (PF) advocates the unrestricted right of the press to receive and disseminate information without any form of interference. In the present world, many societies are coming up with laws and policies that enhance the freedom of the press, and any society that muzzles the right of the press to live up to its responsibility comes under the searchlight and criticism of the international community. In both military and democratic governance, press freedom is advocated. This underscores the ultimate need for communication, which is indispensable for man's collective survival (CRP 1993); hence, the right to free speech is constitutionally provided for.

Press freedom enables press men and media organizations to hold and disseminate information of public importance without undue interference. The gap between press freedom in theory and practice remains evident, particularly in the developing countries of the south like Nigeria and other countries in sub-Sahara Africa where the ruling class uses overt and covert measures to stifle the press from prying into the prevailing bad governance. Ani (2020) explains that, in Nigeria, media coverage is stifled and controlled by the government. This is in an attempt to sit tight in offices and cling on to power "hegemonically." Considering the lacuna between press freedom in theory and practice, the entry for this study tends to examine the extent to which press freedom thrived in Nigeria between 2015 and 2020 under the democratic governance of President Muhamadu Buhari since press freedom is said to flourish much better in a democratic dispensation.

## Origins

In almost every part of the world, particularly in the present time characterized by democratic governance, press freedom is upheld. Comparatively however, the degree of freedom enjoyed by the press in different countries differs (Ebeze 1996). Over time, the developed nations of the world like the USA have shown a resolve for freedom of expression, consequently, freedom of the press. In this regard, Ewelukwa (1999, p. 74) brings to light the Article 19 of the Universal Declaration of Human Rights on 10 December 1948:

> Everyone has the right to freedom of opinion and expression. This right includes freedom to hold opinion without interference and to seek, receive and impart information and ideas thrssough any media regardless of frontiers.

By the above declaration, a foundation is provided for the freedom of expression, and by extension, press freedom. At the international level, more theoretical foundations for press freedom includes the Article 19 of the International Covenant on Civil and Political Rights of 16 December 1966, which took effect on 23 March 1976. It has these provisions: (i) Everyone shall have the right to hold opinion without interference (ii) Everyone shall have the right to freedom of expression: this right shall include freedom to seek, receive, and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media of his choice. In the same vein, Article 13 of the American Convention of Human Rights adopted 22 November 1969 but came into operation on the 18 July 1978 states that, "Everyone has the right to freedom of thought and expression." This right includes freedom to seek, receive, and impart information and ideas of all kinds, regardless of frontiers, either orally or in writing, in print, in form of art, or through any other medium of one's choice. In all these foundations backing up the freedom of expression and PF, the underlying thought is the unrestricted right to seek, receive, and impart ideas of all kinds without interference. Other international bases for freedom of speech and PF are the African Charter on Human and People's Rights of 1981, which

clearly outlines the rights of individuals and those of the people while Article 8 of this charter categorically states that individuals have the right to receive information and to express and disseminate opinions.

Lending more framework to freedom of expression and PF, the Article 10 of the European Convention on Human Rights of 14 November 1950, which took effect on the 3 September 1953 notes that "Everyone has the right to freedom of thought and expression.

This right includes freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers. These articles shall not prevent states from requiring the licensing of broadcasting, television or cinema enterprises."

In Nigeria, the provision for freedom of expression and PF have been strongly backed up by these international provisions for freedom of expression and PF. Fundamentally, the Universal Declaration of Human rights has become binding on Nigeria as it became the 99th member of the United Nations Organization. By this membership, Nigeria has automatically accepted an obligation to do its best to realize the principles encapsulated in the declaration. To this effect, Ekwunife (2020), NOUN (2017), and CRP (1993) show the constitutional provision of PF in Nigeria as enshrined in the 1979 and 1999 constitution of the Federal Republic of Nigeria. The expression of press freedom in the 1979 constitution is almost the same with that of 1999 constitution amended. Looking at the 1979 constitution, Section 22 and 36 of the Federal Republic of Nigeria is currently in use:

> Everyman shall be entitled to Freedom of Expression, including freedom to hold opinions and receive and impart ideas and information without interference. . . .The press, radio, television and other agencies of the media shall at all times be free to uphold the fundamental objectives contained in this chapter and uphold the responsibility and accountability of the Government to the people.

By implications, these constitutional provisions made explicit the role of the press and expressed its freedom in carrying out its legitimate duties. By these provisions and their specificity, the press is entitled to uphold political, economic, social, constitutional, and environmental objectives, among others. The press must expose the citizens to the truth and ideas and cover the activities of the government in its surveillance role. At this stage, it is important to pinpoint that the 1960 constitution, Section 24 made a provision for freedom of expression as well as in Section 25 of the 1963 constitution when Nigeria became a Republic.

## The Press, Regulation, and the Government

There are several impediments to effective press operation. In an interview, a staff with the Accounts Department, FRCN, Abakaliki Ebonyi State Nigeria, identified unprofessionalism (quackery) as the number one hitch to effective media practice in Nigeria. This interviewee observed that there are untrained personnel in the media industry, hence the need for regulation. These untrained personnel are persons who have obtained degree certificates, but not in Mass Communication, Journalism, or related areas. Apart from the untrained personnel, a graduate of Mass Communication and an artiste with FRCN, Unity FM Abakaliki lamented that, even among media practitioners who are certificated in mass communication, a high degree of unprofessional practices is still witnessed.

Lending support to this, Omu (1978) observes that the early press in Nigeria was characterized by minimal corruption. In the writing of MacBride (1980), conceptualizing professionalism poses a challenge, particularly as a form of specialized training is seen as important for professional communicators. From this ideology, it can be deduced that a wide range of unethical practices in the media, whether by trained or untrained media people, can be categorized as unprofessionalism. Writing on "the Virtuous Journalist," Klaidman and Beauchamp (1987) pinpoint the absence of values as a cankerworm to effective media practice. Values such as integrity, contentment, and hard work, among others, have been thrown to the winds. In a lecture on "Issues in Nigeria Mass Media," Onyeisi (2018) explains that the quest for materialism in particular is an unprofessional phenomenon that has eaten deep into media practice.

He notes that this quest for materialism manifests mainly in the acceptance of brown envelop by media men and women. Inadvertently, this made media people to throw ideology and values such as objectivity and ethical soundness to the bin. The need for media regulations, therefore, cannot be over-flogged.

In a lecture delivery, this scholar recounts that in earlier writings on media practice such as the writings of Dr. Nnamdi Azikiwe in his book "My Odyssey" and the writings of Professor Fred Omu, hardly is the word "bribe" mentioned. The implication is that it was then totally absent or too minimal to be noticed. Today, the acceptance of bribe and other undue benefits has spoilt the tides of journalism. Al these sharp practices underscore the need for a regulated media practice and this implies that press freedom does not imply an unregulated media practice.

Media regulations have been identified by scholars and the media industry as serious impediments hampering effective media practice. In Nigeria, many regulations and regulatory bodies have been established in the name of regulating the media. Studies (Ndolo 2005; Ukonu 2005; Udomisor 2013) have shown that from the beginning, the press has been under some roadblocks that interfere with its operations. All over the world, in Nigeria to be particular, different laws and promulgations have been made to put the media practice in shape. This makes the case of an independent press impracticable. Generally, mass media are used to express views, opinions, attitudes, etc. Such expressions thrive more in a democratic setting, for cultural expression, political communication, and economy, among others.

Hilliard and Keith (1996) argue that the regulation of media practice anywhere is both political and economic. This is understood in the writing of Karl Marx that he who controls the economy also controls power, and vice-verse. Karl Marx sees the political and economic institutions as inseparable, hence, laws are made in order to get the media to promote and consolidate the political institution. In any case, no government survives without the media.

An understanding of the above has made the state to seek to bring the media under some sort of control. The earlier form of this control is authoritarianism, which began in the sixteenth-century England but it was meant to make the press a pro-government machinery. This was achieved through licensing, pre- and post-censorship, journey men, among others (Okunna 1998). Apart from the print, looking at the attempt to regulate broadcasting in Nigeria, Udomisor (2013, p. 5) observes:

> Broadcast media policy in Nigeria has been a sensitive undecided and unconcluded issue, not only because of the diversity of the Nigerian society but also because of the failure of majority of Nigerians and their leaders to visualize the role of the mass media in the development of Nigeria.

Policies meant to regulate the Nigeria media are both federal and state directed. At the initial stages of media development in Nigeria, the colonial government had a very insignificant interest in the media, and this manifested in the absence of media regulations. Hence, the media enjoyed somewhat an absolute freedom. These authors note that what could be considered the first media regulation in Nigeria was set up by the colonial masters after the death of Iwe Irohin – the first newspaper in Nigeria. Subsequent media outlets had their contents and management influenced by politics.

Prior to government regulation of the press, Ifeduba (2016) points out that self-regulation existed. He identifies statutory regulation and co-regulation as forms of regulation that check the media practice. Writing on self-regulation in media management, this is the combination of standards showing the appropriate codes of behavior, which the media require for the exercise of the freedom of speech. Self-regulation "preserves government interference." This notion argues that self-regulation could be more efficient in regulating media practice since they understand their own environment better than the government.

In the course of this overview of media regulations in Nigeria, it is necessary to note that in Nigeria, the media are both owned by the government and individuals. While the print media started as a private initiative, the broadcast media were flagged off by the government, and

had a long monopoly of it till 1992 when regulation allowed private ownership of the broadcast station with the emergence of Ray Power Radio followed by Minaj Systems Radio Obosi in Anambra State (Okunna 1998), and other broadcast media followed.

Government media are those media outlets that are owned and controlled by the government while private or independent media achieve a degree of freedom from government control. In essence, it is assumed that such media have no direct control from any political party. Contents are more prescriptive in setting agenda for the people. In the same vein, Ukonu (2005) explains that the government would not let the private media independent; rather, the government exerts chocking control by regulating both the private and public broadcast media. Laws are made to gag both the public and private press. And research observes that "these pernicious laws and decrees against the media gave government officials legal backing to persecute, fine, detain, and imprison journalists, and to proscribe media houses." However, it must be noted that media laws and regulations are not all meant to oppress the media. Laws generally are meant to check and guide a system.

Sampling more opinions of media workers on impediments to effective mass media practice, a long serving broadcaster with the Anambra Broadcasting Service Awka in Nigeria (ABS) argues vehemently that the greatest impediment to effective media practice is censorship. She explains that stories which are not juicy or profitable to the government of the day are shunned in a government medium. In her own words via Messenger chat:

> *Government censorship! Using my own office as a case study, there are times when you consider giving out information that will benefit the citizenry but because the government of the day is the pay master, we are made to refrain from reporting such story thereby being somehow partial in our reportage.*

## Press Freedom and Democratic Governance in Nigeria: 2015–2020

Democracy is an open system of government. It is a form of government that carries the led along; quite representative of the masses. It is a free society characterized by freedom of speech, participation of the people in governance and equality. Democratic governance is a liberal and responsive governance that has the characteristics of sound governance, which Farazmand (2017) argues is "a more comprehensive governance that includes the normative as well as technical and rational features of good governance, presents a balanced view of governance that is less biased and takes into consideration the genuine features of indigenous governance systems that may be at odd or conflict with the globally dominant neo-colonialist power structures. It has all the quality characteristics of governance that is superior to good governance and is sound technically, professionally, organizationally, managerially, politically, democratically and economically. Sound governance is also sound in terms of capacity, and anticipatory behavior; it is democratic in character, responsive, and competent; and its cultural values are embedded in societal values and structures."

Freedom of expression, and by implication, freedom of the press, is expected to thrive unequalled in a democratic governance than in a military regime. Ogbonda (2005) observes that the press under the military was characterized by arbitrary and detaining arrest of media persons, torture of journalists, and other forms of brutality. There are several judicial and extrajudicial measures used by the government to gag the press in both military and democratic governance: court litigations, fines, denial of licensing, assassination, beating of journalists, seizing of working equipment, demolition and proscription of media houses, and mysterious disappearance of media persons, among other judicial and extrajudicial measures (Udeze 2012).

President Mahumadu Buhari came on board as the president of Nigeria in 2015 under a democratic dispensation. A general assessment of his government and stewardship between 2015 and 2020 however, leaves one to ask: Are Nigerians better or worse under President Buhari? (Igwe 2020). For the common man in Nigeria, the Buhari administration's information management comes with lots of distrust.

Obiezu (2020) has noted that advocates of free press in Nigeria have seriously accused the Buhari government of blacklisting a leading national newspaper for criticizing his government. On this note, the Punch newspaper has observed that the Buhari government engages in illegal detentions and attacks on civil society groups and journalists through the instruments of the Nigeria State Security Services (SSS). In the writing of Obiezu (2020, p. 1):

> Until Buhari and his oppressive regime purge themselves of their martial tendency, Punch will not be a party to falsely adorning it with a democratic role. . ...but label it for what it is- an autocratic military–style regime run by Major General Muhammadu Buhari (ret'd)

The above extract is suggestive of the Buhari administration as a government that is military in blood but wearing civilian costume; hence, it continues to see the leadership as one led with military might and suppressing the press. Suggesting a high-handedness with which the press was handled between 2015 and 2020 in Nigeria, the Punch Newspaper has vowed to address President Buhari by his military title – Major General. Being committed to its duty of speaking truth to power and to flay misgovernance and bad governance, Raphael Adebayo, a Nigerian rights activist claims the present government is muzzling the press but Yusuf Alibaba who is one of Buhari's supporters refuted the claim by noting that Punch's allegations of rights abuses are without proof and objectivity; hence, "many of these media houses don't balance information. . ..they have hatred in their hearts against the government . . .say all manner of things just to make sure that their voice is heard." In any case, Punch's resolve to use only President Buhari's military title remains a statement to press freedom. Speaking to Voice of America, the news director for the state-run Voice of Nigeria – Ahaziah Abubakar – maintains that the threat to press under President Buhari's government is overblown as Nigeria remains the freest in terms of press freedom in Africa.

In the period under review, the arrest and the rearrest of Nigerian activist and former Presidential candidate, Omoyele Sowore, for staging a protest against bad governance in Nigeria has raised much dust globally about the exercise of PF in Nigeria. Apart from his arrest, the prolonged detention of this reporter, and also that of the Muslim cleric Ibrahim el-Zakzakky whom the State Security Service has ignored two court orders to free on bail, speaks volume about press freedom in Nigeria between 2015 and 2020. The Punch editorial had also accused Nigerian Governors under the ruling All Progressives Congress (APC) party of President Muhammadu Buhari of using security agents as repressive state apparatuses to punish critics and journalists thereby stifling press freedom. Instances of journalists' arrest in the recent time, which the press has described as muzzling the press, include the May 2019 arrest of Kaduna journalist Stephen Icefan and Bayelsa State publisher Jones Abiri, the August 2019 disappearance of activist and senior media influencer Abubakar "Dariyata Idris," the detention of Agba Jalingo in August 2019, and the cases of journalists Joe Ogbudu and Prince Amour Udemud in 2019 in Delta State on criminal defamation charges (Igwe 2020).

The law of defamation, overtime, has been a cog in the wheel of press freedom, and overt and covert measures have been used to shape the press. Under the military regimes, lots of laws and decrees are promulgated to gag the press. Ogbonda (2005, p. 193) writes:

> The relationship between the state and the press during the period of military rule was tenuous. . .various military regimes arbitrarily arrested, detained and tortured journalists. . .several media houses were arbitrarily shut down and newspapers and magazines copies were confiscated at newsstand. . ..scores of political critics were arrested and detained.

A review of state–press relations under military government in Nigeria with a view to understanding state–press relations under the democratic dispensation in focus would take cognizance of the following state–press relations under President Muhammadu Buhari's military era:

(i) 31 December 1983 to 27 August 1985: Haroun Adamu, Punch editorial adviser; Lade Bonuola and Femi Kusa, assistant editors of the Guardian newspaper; Duro Onabule, editor

of National Concord; and AB Ahmed of the New Nigerian were arrested and detained. Recounting the history of Nigerian mass media, Ogbonda (2005) explains that the arrest of two editors Tunde Thompson and Nduka Irabor of the Guardian newspaper by a military tribunal marked a watershed in state–press relations during the Buhari regime in Nigeria. Anyanwu (2002) explains her terms of imprisonment at Kirikiri Maximum Prison, Lagos State, under the Abacha military junta as a scene that depicts the military intolerance of free speech; hence, she was incarcerated under Decree 2 for daring to caution the military president with her writing. In the present democratic rule in Nigeria where the press is said to enjoy freedom in the discharge of her duty, are these stringent laws and extrajudicial tortures against the press still prevalent?

Rozen (2019, p. I) captures the nature of the press in the democratic governance led by a military president:

> Under Buhari's elected term, CPJ (Committee to Protect Journalists) documented detentions, assaults, and harassment of the press. In one particularly grave case, Jones Abiri, editor of the weekly source, was detained without charge in 2016 and denied contact with his family or a lawyer for over two years.

The case of Abiri is one of the misgivings that the press has against the Buhari's first elected terms in Nigeria. Citing more scenes of the denial of press freedom that characterized the democratic governance under review, Samuel Ogundipe of Premium Times was detained and faced prosecution for refusing to disclose his source of information. Justifying this arrest, Rozen (2019, p. I) quotes General Buhari as saying that the "rule of law must be subject to the supremacy of the nation's security and national interest." Two of Daily Trust offices were also raided by the ministry according to media reports and research carried out by the Committee to Protect Journalists. An opinion poll on PF conducted among practicing journalists in Nigeria revealed that the Buhari administration has not lived up to its 2015 promise that the press would be free and safe under his democratic governance This has been evidenced by the denial of advertisement, keeping eye on journalists, and outright attacks, among other covert measures.

Editor-in-Chief of Daily Nigerian Jaafar Jaafar in the same vein has expressed fears and worry for press freedom in Nigeria, noting that President Buhari's first term was quite hostile to a free press. In his words, "my fear is that this administration in the next four years may not condone some publications. Anything that does not favor the government, or the government doesn't like, they may descend on." Speaking on covert means of gagging the press, Martin Anyankola of Punch newspaper observes that the government could decide to hit the revenue of the newspaper since the government is a very big advertiser in these media. Using the withdrawal of advertisements as a subtle way to put the press to shape, he who plays the piper dictates tune. Attempts to cow the press are not new as the case of Minere Amakiri who was arrested, locked up in an unused toilet, and given several strokes of the cane by the military government of Diette Spiff in Rivers State in 1970 remains a reference point (Udeze 2012; Ewelukwa 2004; Omu 1978).

Reemphasizing the case of Sowore and the government under review, Okonkwo (2019) has noted that Nigeria has been quietly crushing press freedom as security personnel attempted a rearrest of the activist Omoyole Sowore before the Federal High Court in Abuja that freed him on the said charge. On this premise, the Nobel Laureate, Professor Wole Soyinka has slammed the department of State Security and called on civil society organization in Nigeria to team up and resist the government of president Buhari for infringing on the rights of citizens. Perhaps, one thing that is attention-catching about this case was not necessarily the arrest but the manner in which it was done and the given circumstance. The manhandling of the activist in court has also gained the wrath of US Senators representing New Jersey where Sowore is a resident. Capturing press freedom and democracy in Nigeria, Okonkwo (2019, p. I) writes:

> "Worldwide condemnation has trailed Nigeria's government violent re-arrest of journalist and activist, Omoyele Sowore, on Friday (Dec. 6). It came less than 24 hours after Sowore and his co-accused,

> Olawale Bakare, were freed after 125 days in detention during which two courts had granted them bail. Government agents stormed the Federal High Court in Abuja, manhandled the journalist in full glare of world media".

From another perspective, Ogbonda (2005) has observed that press accusations against the military government in relation to the restriction of press freedom is unsubstantiated. However, since 1999, the Nigerian press has criticized the policies and ills of the state officials. The print media has featured caricature images of President Obasanjo at an alarming rate. In the Guardian Newspaper of 23 February 2004, IK Muo noted that "criticism of the president is taking on a hitherto unimaginable dimension and is coming from all quarters." Looking at people's criticisms against the state, Obiezu (2020) observed in an interview that argument about PF in Nigeria is political; hence, Buhari's supporters do not align with the thought that the government muffles PF. Such supporters peg many of the mordant criticisms of the government on hatred and the seeking of cheap popularity. In any case, from the inception of the nascent democracy in Nigeria in 1999 till date, the administrators who are also past military leaders have faced a barrage of criticism from the press.

## Conclusion

This entry is an examination of the degree of freedom enjoyed by the press in Nigeria from 2015 to 2020 as democratic governance brings to the limelight the study of Edmund and Wilson (2018) where the researchers made an assessment of media coverage of anti-corruption campaigns by the Buhari administration. In their findings, the media studied and featured frequently the issues of corruption but mostly in a positive way. The majority of such reports in the selected Nigerian dailies – Nation and Daily Trust Newspapers – however lack depth and prominence. In-depth investigations on such matters are ignored. Using the state as a machinery to hunt opposition party, these researchers observed that the administration under review "has continued to cover its cronies such as Rotimi Amaechi and Babatunde Raji Fashola, former Governors of Rivers and Lagos States. By implication, this state protection of associates strains the editorial independence of media stations that are compelled to report news events, shielding certain interests.

Arguably, much difference has not been experienced between the exercise of PF in military and democratic government in Nigeria as the era of democratic governance seems to portray a military government in civilian costume.

# Preventing Corruption Risk in Legislation: Russia

Alexander Kotchegura and Igor Bartsits
Institute of Public Administration and Management
the Russian Presidential Academy of National Economy and Public Administration,
Moscow, Russian Federation

## Synonyms

Anti-corruption screening of laws; Corruption proofing; Corruption risk assessment

## Introduction

Corruption risk assessment of draft laws and other normative acts aims to exclude the possibility of intentional exploitation of the legal provisions for corrupt purposes. It is a relatively new instrument in the anti-corruption strategies implemented by developed nations, countries in transition, and the developing world. Up-to-date experience demonstrates that various loopholes, defects, and intentionally built-in clauses in existing legal norms are far from being exceptional and constitute the source of large-scale illegal practices.

The Russian Federation was one of the first countries on the post-Soviet space that initiated corruption risk assessment of legal and other normative acts both at the federal and regional levels. The practices of corruption risk assessment of legislation are in many ways innovative and also from the international perspective. Despite the high demand in many countries in Europe for crime-proofing mechanisms that can be applied to the legislative process, there has been little implementation in the field (Savona 2017).

## The Essence of Corruption Proofing

Corruption risk assessment (often called *corruption proofing*) of legal acts can be defined as "a review of the form and substance of drafted or enacted legal rules in order to detect and minimize the risk of future corruption that the rules could facilitate" (Hoppe 2014). Corruption risk assessment of legal acts should be clearly distinguished from corruption of the legislative process itself such as bribery of members of a parliament or nontransparent lobbying practices.

The importance of the corruption risk assessment of legislation is highlighted by the UN Convention against corruption. Article 5 Paragraph 3 of the convention stipulates that "Each State Party shall endeavor to periodically evaluate relevant legal instruments and administrative measures with a view to determining their adequacy to prevent and fight corruption."

The introduction of effective and easily operationalized mechanisms of corruption

proofing requires elaboration of a sound methodology applicable for the assessment of various types of legal and normative acts. Corruption risk assessment of legislation is classified into screening of draft laws and screening of enacted legislation and normative acts. As a rule, it is divided into "initial" and "advanced" assessment. The "initial" type assessment deals with identification of "typical" *corruption risks* or *factors of corruptibility*, i.e., those provisions (regulatory defects, legal formulas, and lacunas) that (a) are often encountered in laws and other normative acts irrespective of the sphere they regulate and (b) with a high degree of likelihood that can be exploited for corrupt purposes. These factors constitute the most obvious indicators of potential corruptibility.

The anti-corruption screening of legal and normative acts can be implemented by the official structures and by civil society organizations and independent experts. The "official" assessment is conducted by government agencies and other public institutions, whereas the "independent" one is undertaken by NGOs, various professional or citizen's associations, and nongovernmental experts.

A list of "typical" corruption risks (also often called corruptibility elements or factors) in legislation makes up an essential part of the methodology (methodological guidelines) developed in particular for the "initial" corruption risk review. Such a list facilitates in conducting a corruption-proofing exercise in line with certain standards and provides the ground for comparison and verification of the results achieved. Verification may be required in order to prevent potential abuse of the assessment procedure itself.

Most frequently encountered "typical" corruption risks (factors) are linked to excessive discretion of public authorities, a lack/insufficiency of control mechanisms, inadequate responsibility and sanctions, ambiguous linguistic formulation, excessive requirements for exercising the rights of persons, limited access to information, lack of transparency, and conflict between legal provisions.

The "advanced" or "targeted"-type assessment is aimed at the identification of "non-typical" corruptibility factors, specific to a particular area of regulation. Both "initial" and "advanced" assessment can be implemented by the drafters of the laws.

In terms of the preparation and organization of corruption risk assessment, the whole process can be divided into several phases – (a) apprehension of the importance and urgency of the problem by major stakeholders, (b) development of unified methodology (guidelines) and training of experts, (c) adoption of respective normative framework providing for regular assessment of draft and existing legislation and other legal acts, (d) carrying out assessment proper, and (e) appropriate enforcement of its results. The order of these phases is largely presentational, and in reality it can be altered, or some activities can be carried out simultaneously.

The start of practical activities in the Russian Federation involving the preparation and implementation of corruption risk assessment of legal acts using standard methodologies dates back to the year 2004. The bulk of the initial work for conducting regular corruption-proofing exercise was done by the Center of Strategic Studies (CSS – a think tank affiliated to the RF Government) in cooperation with INDEM Foundation (NGO) and the Institute of Legislation and Comparative Law, a government-funded entity.

The same year the Center of Strategic Studies presented the first version of the *Guidelines for Initial Assessment of Laws for Corruption*, which has been regularly improved and updated since then. The guidelines have been widely used for corruption proofing of the draft legislation by the State Duma's Commission on Counteracting Corruption and by other commissions of the Duma since November 2005.

The *Guidelines* defined the following key methodological principles of the effective corruption risk assessment: (a) comprehensive nature – meaning that all known corruptibility factors should be identified; (b) accessibility – proposed methodology should be easily applied even by an expert with brief experience; (c) verifiability – subjective factors should be reduced to the largest extent possible; (d) uniformity of practice – existing

standards of assessment should be binding in all cases; (e) independent oversight – there should always be an opportunity for independent corruption screening conducted by a public organization or appropriately skilled citizens.

The official requirement of conducting the anti-corruption assessment of legal and normative acts was formally introduced in the Concept of Administrative reform in the Russian Federation enforced by the Government Enactment No. 1789p on October 25, 2005. On 17 July 2009, the State Duma adopted Law FZ No.172 "On the Anti-corruption Assessment of Normative Legal Acts and Draft Normative Legal Acts." The law provides for mandatory corruption proofing of draft laws and other normative acts including Presidential Decrees (Ukaz) and Government Resolutions, as well as bylaws and normative acts at the level of regional authorities and local self-government.

In accordance with Article 3 of the abovementioned law, corruption proofing can be performed by the Office of the Prosecutor General, the Ministry of Justice, the government and state institutions, and civil society organizations/experts duly accredited by the Ministry of Justice. By its Resolution No. 96p of 26 February 2010, the Russian Government approved "the Rules and Guidelines of Conducting Corruption Risk Assessment of the Normative Acts and Draft Normative Acts." The guidelines comprised 11 corruptibility elements (risks):

1. Excessive discretionary authority.
2. Defining authority by the formula "has the right".
3. Establishing unjustified exceptions to the general rule.
4. Excessive freedom for setting bylaws.
5. Adoption of regulations outside authority.
6. Filling in gaps in legislation by introducing bylaws in the absence of due authority.
7. Lack of or incomplete administrative procedures.
8. Rejection of competitive procurement procedures.
9. Excessive requirements placed on individuals before they can exercise their rights.
10. Lack of clear regulation of the rights of citizens.
11. Linguistic ambiguity.

Law FZ No. 172 stipulates that amendments to existing laws are also subjected to anti-corruption screening. Information about new draft laws and other regulatory acts as well as conclusions of the accomplished anti-corruption assessments are placed on the government web site – www.regulation.gov.ru.

The institution which issued a regulatory act is obliged to consider a prosecutor's appeal (based on the conclusions of a corruption-proofing examination) and provide a written response within 10 days upon receipt of appeal. In case the recommendations of a prosecutor are not accepted, he/she can take the case to a court. In 2015 there were 465 such cases across the country (Dmitriev and Kudashkin 2013).

Similarly, the drafters of a legal act are given 30 days to consider conclusions of a corruption risk assessment prepared and submitted by the Ministry of Justice, other government bodies, or independent experts. However, written response (with either consent or objections) is mandatory only if the conclusions incorporate recommendations to "remedy" the defects of the normative act.

The practice of conducting corruption-proofing reviews in Russia has not been confined only to the federal center. Starting from 2005 the authorities in several Russian regions launched elaboration of their own corruption-proofing methodologies (*guidelines*) followed by the experimental application of this tool in the legislative process. By 2017 such anti-corruption expertise was conducted in the absolute majority of the Russian regions involving also the level of local self-government. Corruption risk assessment performed in recent years by the government agencies and independent experts allowed to remove corruptibility-related clauses in a number of important draft laws at the stage of their "readings" in the State Duma.

## Conclusion

The accumulated experience in Russia and other countries demonstrate that major prerequisites of

the effective implementation of corruption risk assessment are:

1. The comprehensive nature of any corruption-proofing exercise which provides for the mandatory coverage of all draft laws and regulatory acts as well as regular screening of enacted legislation.
2. The transparency of the process by involving civil society representatives and making public the results of the corruption-proofing exercise.
3. The political support from the highest authority.
4. Legally binding requirements to provide written feedback to the conclusions of anti-corruption assessment and penalties for non-compliance with the assessment related norms and rules.
5. Adequate dispute resolution which offers equal opportunities to all the parties.
6. High level of professionalism of experts engaged in conducting corruption risk assessment.
7. Regular monitoring and evaluation of the impact and efficacy of corruption-proofing activities.

One of the major challenges in implementing corruption risk assessment of laws and regulatory acts is proper enforcement of its results, which should exclude unsubstantiated selective approach to the identified corruptibility elements in the draft and enacted legislation in terms of their removal.

# Price Index Contracts

Christopher L. Atkinson
University of West Florida, Pensacola, FL, USA

## Synonyms

Cost-plus-incentive fee (CPIF) contract; Fixed-price contract with economic price adjustment. *Related terms:* Contingencies; Information asymmetry; Risk; Volatility

## Definition

A price index contract includes an adjustment based upon on some agreed-upon measure or formula, reflecting "changed economic conditions" (Nash et al. 2007, p. 444). A price index contract may be utilized in situations where prices for specific commodities are volatile. Using a price index contract may help share risk borne by both government and contractor, raising or lowering allowable costs given future market conditions, which are unknown at the time of agreement (information asymmetry) (Eger III and Guo 2008).

## Introduction

A fundamental concern in contracting is the "indescribability of future states" (Goorha 2018, p. 191). Volatility of certain commodity prices can be a major concern for both public sector procurement offices and contractors. With a fixed price contract, the pricing agreement for a contract is firm at the time of the agreement and relies on best knowledge of expected variable, semi-variable, and fixed costs (Murphy 2009). If the government has inadequate information about the price for a commodity, it may overestimate the cost, allowing the contractor to make more than what might be considered a fair profit. If the contractor has inadequate information, it may bear more of the risk in agreeing to a set price, which underestimates later costs (Eger III and Guo 2008).

Price index contracts allow for adjustment based upon some agreed upon formula or factor, to account for shifts in pricing for commodities that may be unpredictable over the contract period. In this respect, price index contracts include an aleatoric or hedging aspect, to insure against fluctuations so that a party to the contract is not unduly harmed by matters beyond the control of the party, such as through market fluctuations or acts of God. This entry considers contingencies, price volatility as a risk in procurement, and reviews example forms of price index contracting.

## Contingencies

The (U. S.) Federal Acquisition Regulation at 48 CFR § 31.205-7 defines a contingency as "a possible future event or condition arising from presently known or unknown causes, the outcome of which is indeterminable at the present time." The regulation categorizes contingencies in two ways: those extending from known or existing conditions, and those where conditions are unknown. Typically, contingencies in the first category are more allowed, and those in the second category receive more scrutiny, with requirements that estimates of impact to future costs be "disclosed separately" (31.205-7(c)(2)). For contingencies that are foreseeable, contingency costs are "included as part of the cost estimate (e.g., as part of the cost of rejects or of rework material in the total estimated contract price). . .[with] historical data [establishing a basis for] estimating the cost of rejects" lest the costs be rejected as unallowable (Oyer 2011, p. 99).

Contingencies associated with price volatility can represent considerable risk in the contracting environment. Materials costs can affect the profitability of a project (Zhou and Damnjanovic 2012), and increase the possibility that it will not be accomplished in a timely and complete manner. It has been suggested that "in negotiating contract prices, contracting officers generally are willing to include the first category but attempt to exclude the second category from the price" (Nash et al. 2007, p. 125).

## Price Volatility as Risk in Procurement

Public contracts occur in an environment where fairness and reasonableness are key. As a general public contracting principle, "it is in the government's best interest to offer contractors reasonable rewards for doing government work" (Murphy 2009, p. 185), generally in the form of profit. At the same time, the public contracting environment is characterized by significant risk, which must be managed. Risk has been defined as "The uncertainty of a result, happening, or loss; the chance of injury, damage, or loss" (Garner 2014, p. 1524). A variety of risks – from fuel prices to technology advances and contextual instability – can all affect a project. Risk may be thought of as a product of the risk impact and the probability that an incident will occur (Turner 2011).

While the risk inherent in contracting is often considered absorbable by government entities, smaller entities may be less able to withstand considerable liability; the same is true for smaller vendors, where pricing failures can cause hardship or worse, put a vendor out of business entirely. A long-term contract holding a vendor to out of control pricing is less likely to allow for realization of ideals like fair profit for vendors. Even if the result saves money for the government, this may occur at the cost of a business's destruction. As a result, some discussion about the potential for *hardship*, "a (ex post) circumstance in which either it becomes more onerous to fulfill the contract or the equilibrium of the contract fundamentally changes" (Østergaard and Petersen 2020, p. 2), can help ensure contract completion as expected by providing for responses to the shifting of circumstances after contract execution.

Fixed-price contracts are agreements that are creatures of their context and operating environment, and thus are a source of risk in the operational environment of public contracting. Assumptions are made about cost and pricing, and parties agree to unit pricing based on then-current market pricing and assumptions about variations in that pricing over the life of a contract. When those assumptions prove incorrect, the inherent volatility can make contracts a significant liability for a vendor or cause waste for a public

entity. It has been noted in the literature that certain contracting scenarios see fixed-price contracting as passing along significant risk for vendors, notably in projects involving building and road construction, where materials are subject to price fluctuation (Zhou and Damnjanovic 2011).

However, contingencies can increase cost for contracts. When adjustments are not allowed, contingencies feature more heavily in the costing of a contract (Zhou and Damnjanovic 2012). The need to balance risk for both parties (Wahl 1998) is a compelling need for contracts of significant length where pricing of constituent components or commodities is *volatile*, subject to "sudden and extreme price changes" (Garner 2014, p. 1805). For agencies, making decisions about how much risk is acceptable affects their approach to contracting, as they seek to balance exposure with cost (Zhou and Damnjanovic 2011).

The decision to employ contracts that use index or other adjustments, as a means to respond to contingencies beyond the scope of understanding at the time of contracting, represents a form of risk management. Price index contracts can provide an effective means of responding to volatility in cost of materials, especially, and help to assure an evening of risk for both vendor and buyer.

## Example Forms of Price Index Contract

On a continuum of contracting types, Engelbeck (2002) placed firm-fixed-price contracts as presenting greatest cost risk to the vendor. Cost-plus contracts, by comparison, showed greatest risk for the government. Price index contracts lie somewhere in the middle of the continuum, allowing for assumption of risk beyond what might be considered reasonable, while helping to assure a positive contracting outcome for both buyer and vendor.

There are various sorts of contracts where adjustment factors, aligning with the intent of price indexing arrangements, exist. A fixed-price contract can be adjusted to reduce risk for the vendor and possibly the government by adding a redeterminable component, leaving open a final total price to allow for both parties to account for true cost of operation. Ceiling prices can also be included that may force a reconsideration of price if acceptable levels are surpassed (Engelbeck 2002). A formula may not be needed for these scenarios as long as both parties agree with the occasion and mechanism for recalculation.

A fixed-price contract with economic price adjustment is a form of formula-based price index contract, providing "for upward and downward revision of the stated contract price upon the occurrence of specified contingencies," including "increases or decreases from an agreed-upon level in published or otherwise established prices of specific items or the contract end items. . .in specified costs of labor or material that the contractor actually experiences during contract performance, [or]. . .in labor or material cost standards or indexes that are specifically identified in the contract" (FAR 16.203-1(a)). It is suggested that this approach is most appropriate when "there is serious doubt that market or labor conditions will remain stable during an extended period of contract performance, and contingencies that would otherwise be included in the contract price can be identified and covered separately in the contract" (Nash et al. 2007, p. 272). When this form of contract is solicited, firms are evaluated on the basis of their offered quotes without adjustment (Nash et al. 2007). This approach may obviate the need to include contingency allowance in contract pricing (Engelbeck 2002).

The use of an economic adjustment contract can also include incentives based on award fees or performance (FAR 16.203-1(b)). As an example, a cost-plus-incentive fee (CPIF) contract "provides for the initially negotiated target fee to be adjusted later by a formula based on the relationship of total allowable costs. . .to total target costs [as well as] a minimum fee, a maximum fee, and a fee adjustment formula" (Nash et al. 2007, p. 152). The contractor is paid according to the formula, but inherent in the form of this contract is that the contractor can more effectively manage costs, and be given a fee that is adjustable based on the placement of total allowable costs within a formulaic range (Nash et al. 2007). The CPIF is still a price index contract, given its adjustable

nature based on a formula, despite the presence of incentives.

While it is reasonable to assume that a price index contract will allow for improved outcomes for both government and vendor, Eger III and Guo (2008) did not find significant difference between price index and firm fixed price contracts. However, this may have been due to the presence of multi-year price guarantees in the cases studied.

## Conclusion

While public contracting presents a substantially different environment than private-sector contracting, the business of government still requires effective balancing of risk and rewards. Price index contracts seek to manage allowable contingencies in a manner that is potentially helpful for both vendor and buyer, hedging against a market more or less unpredictable, thus reducing the adverse impact of uncertainty and helping to assure a positive contracting outcome for all concerned.

# Primary Education in Uganda: Serving Public Interest

Godwin Kwemarira[1], Isa Nsereko[2] and Waswa Balunywa[2]

[1]School of Management Science, Uganda Management Institute, Kampala, Uganda

[2]Makerere University Business School, Kampala, Uganda

## Synonyms

Collective good; Community goods; Public value; Shared values

## Definitions

Public interest is the ultimate good for the greatest number. It is the outcomes best serving the long-run survival and wellbeing of a social collective construed as a "public." This phenomenon focuses on an ethical standard for evaluating public policies and as a goal civic officials should pursue.

## Introduction

The concept of serving communities is as old as the world. This is supported by widespread traces of serving people in the holy books. Biblically, one of the most important principles of the divine commands is helping people. In this regard, Philippians 2:4 presents the interesting case of not looking to your own interests but each of you to the interests of the others. This could have been written from Ephesus in 52–55 AD or Caesarea Maritima in 57–59, but the most likely city of origin is Rome, around 62 AD. Mark 10:45 offers Jesus Christ as the son of God who did not come to be served, but to serve, and to give his life as a payoff for many in compensation of sin. These examples point to serving the common good at individual level and the fact that it is an age-old phenomenon spanning centuries, nations, and races. The scriptures identify many areas of life in which communal benefit is crucial for a healthy and fair society: justice at all levels, good legal processes, economic opportunity, ethical profit-making, and creation-care. The Religious texts consistently challenge the status quo with their plain warnings about unequal systems against the vulnerable and poor. This is consistent with contesting the poor quality education offered to the humble pupils in Uganda where even their parents do not visit public schools, both learners and teachers go to school late and they leave early.

In ancient times, societies benefited more from the state than modern times. Greek philosophers argue that the idea of public benefit was geared towards the possibility that certain goods, such as security and justice were, to be attained through citizenship, collectivism, and active participation in the public realm of politics and public service. In effect, the notion of the common good is a denial that society is and should be composed of atomized individuals living in isolation from one another. Instead, its proponents have asserted that people can and should live their lives as citizens deeply embedded in social relationships. At the birth of the Renaissance during the fifteenth and sixteenth centuries, the common good was one of the several important themes of political thought. The thought goes back to Thomas Aquinas' theory of common good which became standard in Roman Catholic moral theology. Against that background, the common good became a central concept in the modern tradition of Catholic social teaching, beginning with the foundational document, Rerumnovarum, a papal encyclical by Pope Leo XIII, issued in 1891. Since 1891, each generation has been faced with a similar challenge in its efforts to evaluate how developments in industry and technology affect the common man.

In Africa, the concept of public interest preexisted the colonial period. African kingdoms and empires operated on monarchical systems as a ring of officials who on behalf of the ruler fostered the interests of the subjects. Rulers surrounded themselves with capable people who formed the core of the precolonial civil service. Eventually these leaders received European-style of education in the nineteenth century from elementary schools, seminaries, secondary schools, and eventually universities. This marked the beginning of the end for traditional African education. However, one of the greatest mistakes of this education is that it taught the African to become a European instead of remaining African and change existing traditions to meet the needs and ambitions of Europeans. The earliest colonial schools for Africans included Achimota College in Ghana, Fourah Bay College in Sierra Leone, Makerere College in Uganda, and Lovedale in the Eastern Cape of South Africa among others. By the 1930s, only these four schools offered education that could ensure entrance into University. The Free Church of Scotland, which had established Lovedale, also founded Fort Hare University College in South Africa. Between 1923 and 1936, an average of four students per year obtained degrees at Fort Hare. On average, two or three students were granted degrees by Fourah Bay College which worked in conjunction with the University of Durham. The merits of the European schooling include: learning to read and write, it produced professions in the education, medicine, engineering, agriculture, law, commerce, and other disciplines that enhanced public service. This entry notes that it is only recently with the rise of commerce and industry in the

seventeenth and eighteenth centuries that another type of active life, that aims directly at the production and accumulation of private wealth, was discovered. In the same period, the idea that the pursuit of one's private, material interest is a legitimate form of human conduct (Hirschman 1982).

The account of primary schooling in Uganda dates back in 1895 when Mengo School was started and grew from humble beginnings of a mere elementary school that educated boys at a junior level to a secondary school. As decades went by, in 1977, the Ugandan government launched a 20-year Poverty Eradication Action Plan (PEAP) and Poverty Action Fund (PAF), where primary education was a central component to eliminate poverty by 2020. To emphasize this, in 1997 Universal Primary Education (UPE) was started which led to increase in total enrolment of pupils from over 3 million pupils in 1998 to about 8.6 million pupils in 2010, all enrolled in government, community and private schools.

## The Concept of Public Interest

In the last 100 years, the paradigm of public interest has been variously derided, applauded, dismissed, and revived – leaving little consensus on what it means or if it is even a relevant concept. Herring (1936) defined public interest as the verbal symbol designed to introduce unity, order, and objectivity into administration. Lippman (1955) argues that it is what men would choose if they saw clearly, thought rationally, and acted disinterestedly, and benevolently. Wamsley and Wolf (1996), on the other hand, derived public interest from constitutional interpretation, and the enactment of the supreme public will. In terms of processes, Lewis (2006) identified public interest as a value-driven dialogue of balancing democracy, mutuality, sustainability, and legacy. Kwemarira et al. (2020) argue that public interest is the outcomes attained when government leaders discharge their obligations for long-run survival and well-being of the society particularly public institutions providing quality services to the citizenry.

Schubert (1961) suggested that the concept of common good makes no operational sense. Likewise, Sorauf (1957) stated that the term is too burdened with multiple meanings for valuable use. Still, regardless of its ambiguity, there has never been a society which was not in some way and to some extent guided by this ideal. In one sense, attempting to define public interest is a little like trying to define "love." It is clear that love means different things to different people under varying circumstances. It can change over time in both form and substance. It also changes us – how we think and behave. Although seeing its effects is often possible, it is difficult to observe directly. As a result, it defies quantification and meaningful measurement and is, therefore, difficult to use in certain kinds of analyses. This complexity and fluidity in meaning makes a number of people question whether love exists. A number of commentators' reaction to public interest appear like nonbelievers' responses to discussions of God and the afterlife. Irrespective of this conceptual vagueness, Kwemarira et al. (2019) revived and conceptualized the construct of public interest to have the dimensions of: Common preferences, Citizens' will, and Egalitarianism.

## Primary Education in Uganda

Education is rightly regarded as an important component for positively changing the lives of deprived and disadvantaged group of the population in developing countries. This includes Uganda that has focused on primary education which has brought in positive effects of literacy and other aspects of social and human development such as infant mortality and life expectancy. Besides such direct effects of education, the indirect effects of education have been established such as through its fulfillment of basic needs like better utilization of health facilities, shelter, water and sanitation, and its effects on the behavior of women on decisions relating to fertility, family welfare, and health which in turn enhance the productivity of the people and yield higher wages, taking them above the poverty line.

The attainment of free primary education to all Ugandan pupils has been one of the main policy priorities of the government of Uganda since it gained independence in 1962 from the British. Although there has been an upward trend in school enrolment rates in Uganda since the 1960s, the enrolment rate is still relatively low compared to many other low-income countries. There is a challenge of funding, yet Uganda partially relies on international aid when it comes to facilitating primary education. The authors note teacher absenteeism as a lead issue frustrating the learning process. This is largely informed by low and delayed payment of teachers as they go away to look for alternative ways of survival. This has serious implications for the economy, particularly as the illiteracy rate remains high until universal education is attained. This is as a result of the rampant late coming of teachers which cannot fight ignorance.

Uganda's education system is structured in a hierarchical order of 7-4-2-3 and comprises of pre-primary school education of 7 years; secondary education covering 4 years of ordinary level secondary and 2 years of advanced level secondary; teacher education and business, technical and vocational education, and training of 2–3 years; and tertiary education including university education for 3–5 years. Students who pass with two principal passes at advanced level secondary may choose to progress to university for bachelor's degrees or those with a minimum of one principal pass can join other tertiary institutions that award diplomas and certificates. Some tertiary institutions, like primary teachers' colleges and some nursing schools, also admit students who have only completed their ordinary level secondary education. In this connection, the national vision is to use primary education as a basic tool for the transformation of society and for national integration and development. To offer quality primary education for sustainable development, there are 47 primary teachers colleges (PTCs) in Uganda; 45 are owned and funded by the government and 2 are owned by faith-based bodies; 23 of the government colleges are core institutions that run both pre- and in-service programs; and 22 are noncore institutions that have only preservice programs.

## Primary Education Promoting Public Interest

To date, teachers in government schools, just as elected presidents, governors, chief executives, politically elected leaders, or appointed officers, are public managers. This, therefore, gives them the responsibility to contribute towards the construction of school buildings by providing local materials such as bricks, stones, sand, water, and labor. They create public value by encouraging communities to send learners to school and they support these pupils once in school to remain school. They are entrusted with the stewardship of school assets and learners. They are responsible for security and safety of school children while in school. Teachers particularly promote positive discipline for children both within and outside the school premises. The demands of the parents, learners, and public are taken care of by utilizing the resources from the Ministry of Finance to improve learning and teaching programs. They even use the public resources to provide safe water, stores, offices, staff rooms, sign posts, and sports facilities. Teachers are faithful of their mandate of being as efficient and as effective as possible especially being in school from 8.00 am to 5.00 pm, Monday to Friday. In this way, teachers are administratively competent and skilled in devising the school structures and arrangements, thus guiding learners to academic excellence. Indeed, it is this behavior that makes publics praise government teachers as they foster societal benefit. This entry finds no other reasonable explanation for the extraordinary dedication and commitment of the teachers who teach Ugandan children with energy, resolve, and determination.

## Theoretical Viewpoint

Held (1970) categorizes approaches to the public interest as preponderance theories, common interest theories, and unitary theories. Preponderance theories maintain that something is in the public interest if it is in the interest of most people;

unanimity is not required. Democratic, majority-rule voting exemplifies this. Common interest theories maintain that something is in the public interest only if it is in the interest of everyone. An example might be a fair judicial process, which is arguably needed by everyone in society to resolve conflicting interests. Unitary theories, in contrast, maintain that there are no valid interests outside of the public interest, because only what is right and good is in the public interest. This entry is anchored on public choice theory.

## Public Choice Theory

Public education has been targeted by multiple reform efforts. Such initiatives have been ideologically couched in public-choice perspectives and entrenched beliefs that government is the problem. One unavoidable consequence of this continued bout of criticism is the fact that government currently has noticeably decreased capacity of boosting creation of public value in the education sector. Public choice theory (Buchanan and Tullock 1962) focuses on the individual, assuming that the individual decision maker, like the traditional "economic man," is rational, self-interested, and seeks to maximize his or her own "utilities." According to this view, individuals seek the greatest benefit (at the least cost) in any decision situation, acting to always seek the biggest possible benefits and the least costs in the decisions. People are basically egoistic, self-regarding, and instrumental in their behavior. Even if people are not that way, public choice theorists argue that it enables us to better explain human behavior if we *assume* that they are. Secondly, public choice theory focuses on the idea of "public goods" as the output of public agencies. These can be distinguished from private goods in that a public good, like national defense, when provided to one person will be provided to all.

A third idea associated with public choice is that different kinds of decision rules or decision situations will result in different approaches to choice making. For this reason, structuring decision rules to influence human choice, and in turn human behavior, is a key to the operations of public teachers and schools more generally. In this view, "public teachers are viewed as a means for allocating decision-making capabilities in order to provide public education and services responsive to the preferences of parents and pupils in different societies." In other words, the public choice approach involves the application of economic models and approaches to nonmarket circumstances, especially government and political science, so as to provide structures and incentives to guide human behavior. In the context of Uganda, public schools offer free education to the deserving pupils at no cost, and the enrollment numbers increased at the same time the community is engaged in monitoring these government schools.

## Conclusion

Uganda recognizes primary education as a basic human right and continues to strive to provide free primary education to all children in the country. The government is dedicated to providing equitable access to quality and affordable education to all Ugandans. However, the education sector is constrained by many challenges. These include a high level of teacher and student absenteeism, weak school-level management structures, inadequate availability of learning materials, and large class sizes. A major issue is also the availability of teachers in disadvantaged areas and a lack of accommodation for teachers in rural, hard-to-reach areas. Again, public primary schools depend on funding from the government only. There is need for government through the line Ministry of Education and Sports to empower UPE schools to look for alternative ways of securing funds. This can be best done through collaborating with private funders to work hand in hand with the government in providing more resources needed in public schools. This reduces the challenge of lacking funds in UPE schools, once these resources are raised, they should be well supervised to avoid wastage.

# Principal-Agent Theory of Organizations

Robin Gauld
Department of Preventive and Social Medicine, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand

## Synonyms

Agency theory; Institutional economics; Public choice theory; Theory of contracts; Theory of incentives

## Definition

Theory of interaction between an agent and the principal for whom they act, the point being to structure incentives so that the agent will act to benefit the principal.

## Introduction

The principal-agent theory of organizations ("agency theory" from here on) encapsulates the idea that public sector performance can be improved if incentive-based contracts between different actors are implemented. Principals will be more likely to achieve their desired outcomes, while agents will have clarity around work programs and goals. Agency theory has had considerable influence on the theory and practice of public administration and policy since its emergence in the 1970s. It was particularly instrumental in many high-income developed countries through the 1980s and 1990s, with often radical public sector reforms resulting. Its legacy has endured, with many public sector organizational and policy designs continuing to be underpinned by concepts derived from the theory. Based on institutional economics, agency theory has, therefore, provided a powerful and all-encompassing framework for public sector organization. As such, there has been much written about agency theory itself, and about public sector contracting, which is a central tenet (see for instance Ashton et al. 2004; Klingner et al. 2002; Lane 2001; Pallesen 2004; Pinch and Patterson 2000). There is less literature that discusses the longer-term policy outcomes when agency theory has been an overarching influence on public sector organization (Gauld 2007).

This chapter provides an overview of agency theory, including the key ideas behind it and the organizational and policy arrangements that are derived from it. The chapter outlines the benefits that might be expected to result when the theory is applied to public sector organization. It also highlights agency theory's shortcomings. Finally, it notes areas where theoretical extension is demanded.

## What Is Agency Theory?

Agency theory has its foundations in two ideas which were developed through the study of the economics of organizational and institutional behavior.

First was the notion proposed by public choice theorists that self-interest is the primary motivation behind the activities and behavior of individuals and the organizations that they work for (Mitchell and Simmons 1994; Mueller 1989). Through this lens, people in public employment and public organizations are viewed as "rational utility maximizers," meaning that each seeks to advance their own interests as would a private business or private sector employee in pursuit of profit or an increased salary. In this way, government officials and organizations are presumed to be in pursuit of only budgetary expansion; politicians, for their part, are motivated by the prospect of an expanded share of votes; interest groups, who represent specific sector groups or services users, are only concerned with furthering their own ends and those of their members. Public choice theory suggests that the result of such behaviors is a state which is larger than it should be, along with policies which are designed primarily to serve voter preferences and boost voter support for politicians and political parties, and an economy which is skewed through meeting the demands of selected interests over and above those of the broader public interest. To counter this, public choice theorists advocate limits on the power of politicians, interest groups, and public officials, as well as the implementation of financial incentives and sanctions to ensure appropriate performances.

The second idea, again based on a presumption that self-interest and rational utility maximization drive behavior, is the view that all of life, including public work, private lives, and organizational activities, can be viewed as a set of relationships between different parties (Moe 1984; Perrow 1986). The details of these relationships, once defined, and the requirements of the various parties in any particular venture or activity can be itemized and then written into a formal contract. The contract can, in turn, be deployed for purposes such as setting expectations and objectives of contract partners and for establishing performance assessment and accountability expectations.

Advocates of agency theory and related organizational arrangements presume that contracting will align the interests of principals (those wanting something done, such as politicians, funding agencies, or chief executives) and their agents (e.g., government officials and organizations or non-government and private service providers of public services). The result, in theory, is that the achievement of principals' objectives will be maximized, resulting in a more efficient and effective policy and service delivery outcomes. Alongside of this, the self-interested behavior of agents will be stemmed and focused on principals' goals via various incentives and sanctions. These might include anything from withholding of service delivery payments through to organizational or individual employee performance bonuses (detailed discussion of agency and related theory can be found in Dixit 2002; Laffont and Mortimort 2002; Mueller 1989; Self 1993; Stretton and Orchard 1994; Wallis and Dollery 1999; Walsh 1995).

## Factors that Complicate Application of Agency Theory

Complicating agency theory is a series of behavioral factors encapsulated by the terms "adverse selection" and "moral hazard," as well as the very nature of the public sector and government. Adverse selection results from the existence in any relationship of what are called "information asymmetries." This refers to the simple fact that one party (for instance, an experienced and skilled public servant) may be likely to have more knowledge, and therefore be at an advantage, than another party (such as a politician). Adverse selection can occur when, for example, a principal (a politician) is not able to gain sufficient knowledge about an agent's (a public servant's) background, motivations, or capabilities prior to entering into a contractual relationship (Perrow 1986). It can pose particular problems in

any contracting situation and require considerable investigation to ensure that the potential for adverse selection related-difficulties is reduced.

The risk of "moral hazard" arises once a contract has been agreed to. It stems from the fact that, on a day-to-day basis, principals are not able to observe most agent activity (Moe 1984). Principals are, therefore, reliant on agents carrying out tasks and performing at a level as specified in a contract. The ever-present prospect of moral hazard means an ongoing requirement for monitoring. This can result in considerable costs to both contracting parties, as well as goal-displacement behavior on behalf of agents where they place a disproportionate emphasis on work that is specifically subject to monitoring. By goal displacement, this means that agents focus on monitored goals, to the detriment of other organizational and individual goals that may not be directly monitored.

A further factor complicating agency theory is a range of circumstances particular to government and public sector work. These include that policy refinement is frequently left to the implementation process and is routinely the responsibility of agents, being public officials and not principals (Hill and Hupe 2002); most government agencies have several and often conflicting tasks and objectives which can be difficult to define and itemize (Wilson 1989); multiple principals and agents characterize the public sector as do situations in which principals often double as agents; the public sector tends to lack competition, at least in terms of core government non-trading functions (Allison 1979); and the public workforce and agencies are motivated by a complex array of factors, only one of which might be financial incentives (Dixit 2002; Le Grand 2003; Thaler 2015; Wilson 1989).

## Improving Agency Theory

There is now considerable international experience with application of agency theory to public sector organization. It has provided the foundations for public sector reforms in a range of high-income countries. While there is an absence of research into whether long-term public sector performance has improved as a result, and it could be difficult to determine direct causality, it may be fair to suggest that performances have continued to be questionable. Indeed, politicians in most high-income countries, along with international agencies, continue to demand improvement in a context where policy challenges are increasingly complex (e.g., issues ranging from how to deal with population aging and chronic disease through to inequality and climate change which require considerable cross-government coordination and long-range planning). This is despite agency theory having an ongoing and influential role as a framework for establishing the roles of principals and agents and, in turn, for managing policy development and implementation.

The above discussion brings to the fore questions over the applicability of agency theory to complex and changing policy and management issues and points to several agency theory deficiencies. Most of these have been alluded to elsewhere but not incorporated explicitly into the theory (see, e.g., Dixit 2002; Laffont and Mortimort 2002; Le Grand 2003). In other words, they do not feature prominently in discussions by agency theorists about the implications of, and prospects for, arrangements derived from the theory. There are four key shortcomings. These include:

1. Principals (in this case, political leaders and public officials at different levels of government and the health system) often may not have sufficiently detailed knowledge of what they want when setting parameters and building incentives and goals for agents. If they do, and decide upon a certain policy path, then this has implications if political and policy preferences are subsequently altered. To counter such problems, principals may need a longer-term view, as discussed below.
2. Principals may not recognize in advance the ramifications of the directions they set. In response, it might be suggested that principals clearly need to model in detail the possible outcomes of various policy options. Such an approach, however, would be subject to the

widely noted limits of "rational" policymaking (Lindblom 1959).

3. Agency theory fails to adequately account for situations when principals regularly change. Such changes, for instance in political leadership, can be a harbinger for change in policy directions and the organization of the public sector. Agency theory may simply need to be amended to include reference to the fact that arrangements inspired by it cannot be relied upon to produce continuity in transitions between principals.
4. Following the previous point, when the administrative systems within which agents work are regularly restructured by principals, with the potential to induce confusion and chaos, this undermines the assumption inherent to agency theory that principals are in control and capable of providing consistent direction over time; it also disrupts administrative processes and continuity, creating obstacles to effective individual and aggregate agent activity. A consequence is that agents may develop their own methods and systems for working and fail to coordinate with one another. If incentives are to be relied upon for complex organization and in scenarios of transition, then their design needs to be sophisticated. A simple vertical contract between principals and agents may not be enough; horizontal contracts between agents may also be required, and these may need to be coordinated by principals. By implication, this means that principals need the detailed knowledge and foresight discussed in points 1 and 2 above, along with commitment to stability implied in point 3.

Thus, for agency theory to be an effective organizing principle now and into the future, more intricacy in its development may be required (Deacon 2004). Yet even if an approach that accounted for the four points above were applied, this may be too constrained for the exigencies of politics, the multitudinous motivations of individuals and public organizations, the ever-changing and increasingly complex nature of administration and society, and the challenges for the foreseeable future. It may also prove to be administratively demanding, raising questions over transaction costs.

If so, then alternatives may need to be considered. One possibility is for increasing the level of centralized policy control and sector oversight, in short, the growth of a more comprehensive iteration of agency theory that incorporates the coordination of principals and agents. If contracting is to remain a fundamental principle of public sector organization, then longer-term contracts, combined with standardized objectives and funding levels (inherent to comprehensive policy), may promote more commitment among agents to centrally driven directions. This points to the need for development of a consensus-based variant, bringing together principals and agents, with an aim of stewardship over a subset of contractual agreements between interested parties. In practice, this may mean lengthy consultation processes that involve policymakers, key interests, industry, and provider groups with a primary aim of forging long-term goals. Such an approach might be underpinned by a focus on outcome-oriented policies being increasingly pursued by various national governments (Baehler 2003; Christensen and Laegreid 2013; Hoque 2008). Forging a long-term, cross-government view may carry with it a risk of committing to particular directions that, following any future political change, could be rejected. Consensus may, also, over time lead to policy embeddedness and establishment of a set of institutions that would be resistant to future reform (see Blank and Burau 2004; Putnam 1993: 179; Wilsford 1994). This may be appropriate when effective responses are demanded to complex policy problems such as those listed earlier in this chapter.

## Conclusion

Short of the developments described in the previous section, which might be seen by agency theory proponents as undermining competitive incentive systems, the rudimentary method of simple contracts between principals and agents may fail to provide an effective developmental foundation for multifarious administrative issues.

# Principles of Good Governance, The

Agustí Cerrillo-i-Martínez
Faculty of Law and Political Sciences, Universitat Oberta de Catalunya, Barcelona, Spain

## Synonyms

Principles of good government; Quality of government; Sound governance

## Definition

Principles of good governance are those rules that enable to guarantee the greatest possible democratic status and the achievement of the objectives in governance.

## Introduction

Good governance is a normative approach to governance. It identifies the rules that have to be fulfilled by actors participating in public decision-taking. From a general point of view, principles of good governance refer to a list of common principles that are useful and important to improve decision-making processes and, in the end, to strengthen democracy and to improve social and economic development.

In the following pages, different approaches to principles of good governance are shown, and the differences between them are briefly highlighted. A general overview to the most recognized principles of good governance is also given.

## Two Approximations to Principles of Good Governance

Currently there are different approaches to principles of good governance. Principles of good governance are used to set the conditions that should be fulfilled by actors participating in governance networks. In this direction, some rules state principles that govern the functioning of governance networks and the decision-taking procedures.

But principles of good governance are also used to define the conditions that should be fulfilled by recipients of international aid. In fact, international organizations like the World Bank, the International Monetary Fund, the United Nations, or the European Union require the fulfilment of principles of good governance in their international aid programs.

However, there is not an agreement about which are the principles of good governance in each case. In addition, there have been several and different attempts to define these principles. As it will be shown, defining the principles of good governance is difficult and controversial (Graham et al. 2003). Furthermore, there is not either an agreement about the utility of this concept and its role to foster democracy and development (Andrews 2010). In particular, some authors consider that good governance tends to enhance "the dominant, imperialistic, and globalizing elites' political and economic interests" (Farazmand 2004).

## Good Governance as the Setting in which Networks Operate

Governance networks can take very different forms and degrees of formalization. However, in general terms they are characterized by a plurality of actors and the interdependence and interaction existing between them (Klijn and Koppenjan 2016).

As the recognition of networks has spread in the last decades, various doubts and difficulties generated by their functioning have also been put forward. In particular, the existence of a gap between democracy and governance has been observed. Sørensen and Torfing (2005) have proposed a number of criteria for evaluating the democratic anchorage of the governance networks. In particular, they consider that governance networks will have a democratic anchorage to the extent that they are controlled by democratically elected politicians, that they represent the grassroots members of the participating groups and organizations, that they render accounts to a territorially defined citizenry, and that they facilitate interaction in accordance with generally accepted standards of democratic conduct. According to these authors, these four anchorages offset any defects which may emerge and jointly provide a solid source of democratic legitimacy (Torfing et al. 2009). In order to incorporate these elements and to facilitate the democratic legitimacy of governance networks, different authors have noted, from different perspectives, the possibility of regulating governance by way of the governance of governance, the management of networks, or metagovernance, in which they have highlighted different roles for the public powers (Sørensen and Torfing 2009).

There is a variety of tools for developing metagovernance like principles of good governance. Principles of good governance define the setting in which governance networks operate. From a normative point of view, the concept of

governance networks should integrate principles that enable them to guarantee the greatest possible democratic status and the achievement of their own objectives. These principles set the framework in which networks develop their activity.

The principles of good governance have often been related with those of good administration which are receiving increasing legal support as such at the European level. The principle of good administration includes those principles of organization and action that seek to guide the conduct of public administration. However, its scope is limited to government and public administration and does not extend to all the actors of governance networks, as is the case of the principles of good governance. The principles of good governance have also been related to quality of government (Rothstein and Teorell 2008).

In particular, the principles of good governance must be those that foster good functioning of governance networks and therefore enable them to achieve their goals. In particular, they may contribute to the democratic anchorages of governance networks. From this point of view, the principles of good governance have to permit and guarantee that all the necessary actors are included, each of them assuming their corresponding role, that the actors in governance networks have the necessary and sufficient conditions to take the decisions that correspond to them, and that decisions can actually be taken.

The principles of good governance that have the mission of guaranteeing the achievement of these goals are those of transparency, participation, accountability, and effectiveness. Some authors link to this principle the principles of coordination and coherence (Peters 2008). Others include the principle of impartiality (Rothstein and Teorell 2008).

The principles of good governance are recognized in some rules. Thus, in environmental legislation, the United Nations Convention of the Economic Commission for Europe on access to information, public participation in decision-making, and access to justice in environmental matters (Aarhus Convention) of 25 June 1998 is a clear example.

## Good Governance as a Condition to International Aid

Principles of good governance also have an important role in international aid. In the last decades, donor agencies have been using principles of good governance to distribute their aid to recipient countries and to drive changes in their institutional frameworks to improve social and economic development. Principles of good governance have also been used as a condition to receive international aid.

Since the first use of the term good governance as a policy strategy by the World Bank in 1989 (Doornbos 2001), the use of principles of good governance has undergone changes in its conception and content. In fact, nowadays there are different conceptions of good governance among aid donors which are settled on different principles. A comparative analysis of aid programs of the United Nations, the International Monetary Fund, the World Bank, the Organisation for Economic Co-operation and Development, and the European Union shows that they include different principles when defining good governance.

In spite of this, it seems that there is an agreement about five principles of good governance: accountability, effectiveness and efficiency, openness and transparency, participation, and the rule of law (van Doeveren 2011). But there are other principles that are also included when defining good governance by some international institutions like absence of corruption, democracy and representation, equity and inclusiveness, or human rights (Gisselquist 2012; van Doeveren 2011).

Once again, donors also have different conceptions of each principle of good governance. In fact, donors do not usually define these principles, and in case they do, they use simple definitions. For instance, the World Bank's 2007 report, *Strengthening the World Bank Group Engagement on Governance and Anticorruption*, only provides a brief quote from former president about good governance instead of a definition. The same happens in the European Union *White Book on European Governance*.

In the last decade, the debate around good governance is about its real impact on

development (Andrews 2010). In this direction, the Economist (June 4, 2005) was graphically critical with the role of good governance on development noting after defining good governance as good for economic development that it may generate the following infinite regress: "What is required for growth? Good governance. And what counts as good governance? That which promotes growth. And what is required for growth. . .."

In addition to it, some recipient countries and also some authors are also critical considering that principles of good governance impose a Western liberal model of democracy, they are a poor guide for policy changes, they are a new generation of political conditionalities, and they ignore institutional variations among different countries (Doornbos 2001). To overcome this deficiency, alternative concepts have been proposed. For example, sound governance consists of several major components or dimensions that work in concert with others which include international or globalization forces (Farazmand 2004).

## Defining the Principles of Good Governance

Although many definitions of each principle of good governance have been proposed, there are some common elements which are shown next.

First of all, the principle of transparency. It consists of the knowledge by state and non-state actors of what is happening inside an organization through the placing at their disposal of information generated by the organization through different mechanisms. A first mechanism of transparency is freedom of information also known as the right of access to information, whereby state and non-state actors can gain knowledge of information on request to its producers or proprietors in order to be shown it or to be given a copy. This mechanism has a reactive character and constitutes a powerful, though usually underused, instrument for controlling the activity of government and public administrations. A second mechanism of transparency is dissemination of information. By way of this mechanism, the public administration circulates information in a generalized manner by creating dissemination services mainly on the web.

Secondly, the principle of participation. Through participation, non-state actors have the possibility of providing to governmental actors and, in general, to the networks, sufficient elements of judgment to guarantee not only the legality but also the rightness and appropriateness of decisions and also endow them with democratic legitimacy. However, this participation must meet certain requirements to guarantee its democratic anchorage, for instance, that the participants represent the grassroots members of the participating groups and organizations. The regulation of participation must guarantee a participation of quality and prevent the articulation of only a limited number of interests. It must also guarantee impartiality, objectivity, and the duty of due care. Various mechanisms of participation exist, which adopt different nuances. On one hand, those that come under the heading of procedural participation, which covers those mechanisms whereby the citizens participate in the process of generating provisions or proceedings or, in general, in the definition of public policies. And on the other hand, organic participation, which is characterized by the incorporation of the citizens into administrative bodies with decision-making, consultative, or monitoring functions. Participation must not only refer to the mechanisms of formal participation (public information, public hearings, etc.) but also to those of informal participation (hearings, *enquêtes públiques*, etc.).

Thirdly, the principle of accountability. It can be defined as "a social relationship in which an actor feels the obligation to explain and to justify his or her conduct to some significant other" (Bovens 2005). One of the most important consequences of the democratic principle is that those who exercise public powers must answer for the use they make of those powers, since they do not belong to those who exercise them but to the citizens in whose name they are exercised. Accountability acquires greater significance to the extent that "political leaders have found themselves in the position of having to take political responsibility for programs that they have little

capacity to influence directly" (Peters 2008). There are some traditional mechanisms for guaranteeing accountability, such as elections and the citizens' participation in them, and periodical auditors' reports on the public accounts (Agere 2000). In addition to them, in recent years, new accountability mechanisms have emerged, which are more flexible and make it possible to overcome the problems posed over time by those more traditional mechanisms, in addition to being easier to transfer to other scenarios such as governance networks. Thus, for example, the figure of the ombudsman, the formation of decentralized power structures, the introduction of citizens' participation mechanisms, the watchdog role of the press, or the establishment of internal administrative control measures are accountability mechanisms. Access to information and transparency in general are also important mechanisms for guaranteeing accountability mechanisms.

Fourthly, the principle of effectiveness. It is the achievement of the result corresponding to the goals set by the organization. The duty of acting effectively, which derives from the principle of effectiveness, also entails the need to act efficiently and economically, that is, to say, the principle of effectiveness also gives rise to the criteria of efficiency and economy. As Ponce has said, "the principle of effectiveness means that in the performance of its function public administration considers the resources available and the goals to be achieved, studies from this perspective the various practically feasible alternatives of action before choosing one, and weighs up the foreseeable effects of that choice" (Ponce Solé 2001).

## Conclusion

Principles of good governance have an important role defining the framework for decision-making processes. They can also contribute to increase democracy and improve social and economic development.

However, as it has briefly been shown, it is difficult to identify the principles of good governance. It is also complex to define them. In the last decade, there have been several attempts to do so which have quite different results.

That is the reason why some authors consider that defining the principles of good governance is a hard work without too much practical consequence (Doornbos 2001). Besides, some authors propose that the concept of good governance should be disaggregated on its various components and research should focus on them (Gisselquist 2012).

Principles of good governance should not continue being a catchall term. Otherwise, they will not be useful neither to drive governance nor to analyze it.

# Prisons as Social Policy, United States

James D. Slack
Jackson State University, Jackson, MS, USA

## Synomyms

Confinement; Facility; Imprisonment; Incarceration; Prison

## Definition

Deadline: A form of punishment in the nineteenth century, where an inmate would be shot to death if he crossed a particular line in the yard.
Just desert: The theory behind retribution. A convicted criminal will get what he deserves, or his "just desert."
Lock-step: a form of punishment where an inmate walking in line must keep the toe of the shoe on the heel of the inmate's shoe in front of him.
Rates of recidivism: the proportion of former inmates who reenter the prison system.
Stocks: A form of punishment used primarily in colonial times through the nineteenth century, where an inmate's head and hands are locked in place for an indefinite amount of time.

## Introduction

America is a land of prisons and prisoners (Bureau of Justice Statistics 2016). It ranks first in the world with over 4500 facilities. Russia, second in the world when it comes to the number of prisons, has four times fewer than what is found in the USA. While having only 5% of the world's population, one in four of the world's inmates is serving time in American prisons. There are 2.8 million Americans in prison. One child in every 128 has a parent incarcerated. Nearly one-third of all black men in the USA will be incarcerated at some point in their lives.

American federalism is reflected in the prison systems. There are a little more than 100 federal prisons and about 130 private prisons, but the remaining thousands are divided among the 50 states' departments of correction. Prison systems, however, share some commonalities. All tend to be organized into three categories. Maximum security prisons hold the most dangerous offenders. These facilities are built with confined quarters, sections demarcated with a series of iron gates and doors that open mechanically, and layers of electrified razor-wired fencing separating the various subunits and surrounding the entire facility. Electrified razor-wire fencing typically is planted 5–8 f. into the ground to prevent underground escape attempts. The entire facility is marked with watchtowers.

The second level consists of combinations of medium and maximum security facilities. When located within a blended institution, the maximum security component is segregated with similar safety features as found in the stand-alone maximum security prisons. Inmates in the medium-security units, whether blended or stand-alone, are afforded more allowances. Still housed in traditional prison blocks, they tend to have more time to socialize in common areas and in the outside yard. There may be a better library and more lenient gymnasium visitations. There may also be more opportunities to engage in faith-

based activities. The environment is a bit more relaxed because the inmates, in comparison to those in the maximum security units, are deemed to be a lesser threat to themselves, other inmates, and the correctional officers.

The third level consists of minimum-security facilities, and these are sometimes called camps, farms, or detention centers. Low-risk inmates, serving time for nonviolent crimes, are placed in this category. The housing tends to be dormitory or military bunk bed, in style. The living arrangements tend to have unlocked doors to allow inmates freedom to walk about. Inmates may even be assigned to work details outside the facility, picking up trash along the highways, or cleaning the inside of public buildings. Some minimum-security facilities have programs that engage the inmate with paid private sector jobs during the day or provide weekend furloughs to visit loved ones.

## Origins

The modern prison stems from colonial times (Stohr and Walsh 2016). The Jamestown and Massachusetts Bay colonies developed the earliest arrangements for incarcerating offenders. These arrangements included pretrial housing in homes, taverns, and barns. Posttrial sentencing, if not hanging, included stocks. This was a wooden two-part devise with three holes cut as corresponding semicircles in both the upper and lower sections of the wood. With the two parts opened, the convicted person's head and hands were fit into the holes. When the two parts closed and locked, the head and hands remained stationary. Stocks typically were located in a public area so the convicted person would also receive ridicule and scorn from the community. Early colonial confinement and punishment also included the European tradition of charging fees to each incarcerated man.

Given the influx of new settlers from Europe, these makeshift arrangements became inefficient and ineffective. Many inmates could not afford the fee, and, furthermore, confinement in a house, tavern, or barn was not secure.

Three models of prisons emerged in the eighteenth and nineteenth centuries, and parts of these models are seen in contemporary prisons (Krisberg et al. 2015). The Pennsylvania Model was structured around the idea that inmate punishment was best served in isolation. If inmates were kept from one another, the less chance of corruption by the other. Hence, the purpose of segregation was both to punish and to rehabilitate. Prisons adopting the Pennsylvania Model employed codes of silence. No man could speak unless specifically asked a question by a correctional officer. Inmates were not allowed to eat, socialize, or work with other inmates.

The New York Model was predicated on the idea that punishment and rehabilitation was most effective when associated with the value of community. Prisons using this model required collective work and common socialization. Inmates were organized into work teams, and they were permitted to eat and talk in common areas. Like the Pennsylvania Model, however, inmates slept in single cells isolated from one another.

The Newgate Prison Model is the third model of prison. Connecticut's Newgate Prison was founded on Quaker values. From confession and forgiveness would flow redemption and rehabilitation. Faith was incorporated into the everyday activities of the inmate. Prayer was consistent throughout the day – at dawn, before and after meals, before and after work, and at dusk. Church services were daily, and bible study was mandatory.

## Prisons as Social Policy

For most Americans, prisons are used as a social policy (Cullen et al. 2014). However, which aspect of social policy is most effective, or even desirable, is debated widely in the USA. There are five aspects of social policy that influence, or are influenced by, correctional institutions in the USA. First, prisons perform an **incapacitation** function in society. As long as a criminal is locked-up, he or she can do no further harm to citizens in the community. The incapacity function also is applied to safety inside the prison. Segregation blocks are used to keep very dangerous

criminals from harming other inmates. Incapacity social policy is best seen in maximum security facilities.

Second, prisons implement **retribution**. It is the basis of the "just desert" theory. Convicts get what they deserve – their "just desert" – through punishment. Some historical acts of retribution are now viewed as cruel and unusual punishment. Examples include the "deadline" and the "lock-step." The deadline was used before the invention of electrified razor-wire fence. It entailed an invisible line that, if crossed by an inmate, a guard with a rifle would shoot to kill. (Hence, this is the origins of the term "deadline.") The lock-step was a more Draconian punishment because it was used every day on every inmate. Whenever they moved from one part of the prison to another, inmates were lined up in single file. Their hands were on the shoulders of the inmate in front, and their entire torsos were pasted together. When they marched, each inmate's toe had to be in constant touch with the heel of the inmate ahead. When an inmate got out of lock-step, he was beaten. The lock-step was so painful that, not uncommon, some inmates opted for suicide after just a period of months in prison.

Contemporary forms of in-house retribution include lock-down, where a block of inmates are locked in their respective cells for a period of time; transfer to segregation, where one inmate is placed into lock-down within a segregation block; denial of parole and, hence, the inmate is forced to reach end-of-sentence status; and extension of sentence, due to conviction of further crimes committed in prison. The policy of retribution, while evident in all facilities, is seen most vividly in maximum security institutions.

**Deterrence** is a third aspect of social policy. Prisons are believed to deter further crime by the convict when he or she is either paroled or exits at end of sentence. Prisons are also believed to stop other citizens from committing crimes. Many prisons set up special programs for juveniles who have crime records. These at-risk children visit a prison where selected inmates give them a glimpse of life in the facility. Some corrections departments have established programs that encourage any citizen or civic group to visit a prison to see deterrence in action. Through these kinds of programs, it is hoped that at-risk youth will think twice about crime, and citizens will not think twice about advocating on behalf of prisons in their communities and state. Deterrence is the logic behind both maximum and medium security institutions.

A fourth aspect of social policy is **rehabilitation**. This policy requires changing the attitudes of inmates to make each want to stay away from crime once he or she exits the institution. Prisons are criticized for failing the rehabilitation function (Cullen et al. 2014). Rates of recidivism tend to be over 50% and can be as high as 90% (Slack 2014). Primarily due to limited state funding, prisons tend to choose the cost-effective routes of social policy – incapacitation, retribution, and deterrence. Rehabilitation is a labor-intensive process, requiring counseling, small-group session, and opportunities to learn skills useful on the outside. Rehabilitation is most effective in minimal security level facilities.

The fifth aspect of social policy found in prisons is **reintegration**. Like rehabilitation, reintegration tends to be less than successful (Mears and Cochran 2015). It costs money to prepare an inmate to go back into society. Preparing inmates to cope with fundamental issues – like starting a checking account or using the internet to search and apply for a job or how to interview – requires institutional capacity that is often lacking. Further, an inmate exiting the institution needs hard cash in order to survive. Some states give the exiting inmate as little as $10 and a bus ticket. Too often, the bus ticket is sold, and all cash is consumed by dinner on that first day (Slack 2014). The inmate then has to choose between criminal activity (and reentry into the prison system) or becoming homeless and unsuccessful in reentering the free world. Reentry programs work best in minimal security prisons, and they fail worst in maximum security facilities.

## Conclusion: Prisons as Social Policy

Contemporary prisons in the USA face many problems. Some are ageless problems, dealing

with the politics of overcrowding (see Pratt 2009) and perhaps even representing a new form of Jim Crow social policy (Alexander 2012). Is the purpose of prisons to warehouse or change inmates? That question has never been fully answered. Effective faith-based programs are increasingly challenged (Sullivan 2009), inmate-victim restorative justice activities remain experimental (Zehr 2002), and effective reentry programs are rare (Mears and Cochran 2015). Yet American prisons do reflect social policy. Whatever successes or failures encountered, they gauge the priorities and fears of society.

# Privacy Rights and Public Employment

Martin Joseph Adamian
Department of Political Science, California State University, Los Angeles, CA, USA

## Synonyms

Constitutional law; Federalism; Privacy; Privacy law; Public employment; Statutory law

Individuals employed by federal or state governments are protected by the United States Constitution, state constitutions, as well as federal and state statutes. The Bill of Rights and the Fourteenth Amendment provide public employees with an avenue of redress that would not be available to private employees. The United States Constitution restricts what governments can do, including protections for free speech and from unreasonable searches and seizures. Therefore, governments are prohibited from restricting speech and from searching employees in ways that private employers are not. However, the government typically maintains a level of oversight and control of its employees that is much more extensive than that of a private employer, and the courts have acknowledged this.

Although the term "privacy" is not used in the United States Constitution, the United States Supreme Court has recognized the existence of a right to privacy in the *Griswold v. Connecticut* (1965) (381 U.S. 479) and subsequent cases. Justice Douglas, writing for the majority of the Court cited the "penumbra of specific guarantees of the Bill of Rights" including the right of association contained in the First Amendment, as well as the Third Amendment, in its prohibition against the quartering of soldiers "in any house" in time of peace without the consent of the owner. Perhaps most directly on point is the Fourth Amendment's "right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures." These privacy rights extend to public employees with some limitations.

The Fourth Amendment protects an employee's "reasonable expectation of privacy" under the circumstances, and any government search must be reasonable in both inception and scope (*O'Connor v. Ortega*, 480 U.S. 709, 723 (1987)). In other words, the purpose must be sound and defined in such a way that it limits the searches scope. Although there is some ambiguity, courts have found the government's interest in efficiency precludes requiring warrants or findings of probable cause for workplace searches of public employees' desks, files, and other work-related spaces. In this regard, searches may be reasonable even when they're not based on suspicion that any particular employee has violated a workplace rule.

In *O'Connor v. Ortega* (1987), the Supreme Court explained that the Fourth Amendment applies to "[s]earches and seizures by government employers or supervisors of the private property of their employees" (Id. at 715). However, the Court concluded, some privacy expectations held by public employees may be unreasonable given the "operational realities of the workplace" (Id. at 717). The operational realities test has become the measure by which courts gauge whether public employees have an expectation of privacy that is deemed reasonable.

*O'Connor* involved an administrative search that led to the dismissal of the Chief of Professional Education at the Napa State Hospital, Dr. Mango Ortega. The Ninth Circuit Court of Appeals held that "Dr. Ortega had a reasonable expectation of privacy in his office" and that the hospital was liable for damages resulting from the unlawful search. The Supreme Court granted certiorari and reversed the Ninth Circuit.

Chief Justice William Rehnquist, joined by Justices Sandra Day O'Connor, Byron White, and Lewis Powell, held that the determinations of whether public employees have a reasonable expectation of privacy must be made on a case-by-case basis since working conditions can vary greatly from one public employee to the next and the analysis is therefore always fact intensive. The plurality found that Dr. Ortega had a reasonable expectation of privacy in some of the areas searched, including his desk and file cabinets. However, the next question became whether the search was reasonable in its inception and in its scope. Because there was a factual dispute regarding the justification for the search, the case was remanded to the district court.

*O'Connor* stands for the principle that "individuals do not lose Fourth Amendment rights merely because they work for the government instead of a private employer." However, the constitutionality of administrative (i.e., non-law enforcement) searches depends on two factors. First, whether or not the employee has a reasonable expectation of privacy in the circumstances involved. This threshold issue is determined by looking at whether the employee actually had an expectation of privacy or whether the expectation is one that society is prepared to accept as reasonable. Second, even if the employee did have such an expectation, an administrative search would be constitutionally permissible if the government could show that "both the inception and the scope of the intrusion . . . [were] reasonable."

The Fourth Amendment protection for a public employee's business office is to be assessed "on a case-by-case basis," in light of whether the office is "so open to fellow employees or the public that no expectation of privacy is reasonable." Little guidance is provided to determine how open "so open" must be.

The monitoring of public employees' email, tweets, text messages, and similar communications is also raising a number of Fourth Amendment issues that will undoubtedly continue to be litigated in the future. Email is a relatively open communication channel so it may be difficult to demonstrate a reasonable expectation of privacy in its use at work. Voice mail is more similar to a telephone conversation, in which one does have a reasonable expectation of privacy. However, an employer may be able to reduce his expectation by not providing private passwords for all employees or by informing employees that voice mail and telephone conversations will be monitored for business purposes (e.g., efficient and appropriate communication with customers). Nevertheless, Fourth Amendment protection maybe applied to communications that are

clearly private, such as between spouses about family matters.

In *City of Ontario v. Quon* (2010), the city monitored the use of a government-issued pager by the police officer and subsequently disciplined him based on the number and content of the messages he sent and received (560 U.S. 746). The Supreme Court applied the reasonableness standard used by the plurality in *Ortega* and upheld the constitutionality of the City's action. The court reasoned that the search was reasonable in its inception and scope because it was partly intended to determine the effectiveness of the police department policies regarding pagers.

## Drug Testing

Drug testing also presents Fourth Amendment privacy issues. Administrative (noncriminal) drug testing is reasonable for personnel in law enforcement, public safety, or other positions where, on balance, the employees have a reduced expectation of privacy and the government and public interest outweigh their privacy interest (*National Treasury employees Union v. Von Raab*, 489 U.S. 656 (1989)).

In *National Treasury Employees Union v. Von Raab* (1989), the Supreme Court upheld a United States customs service program for urinalysis drug testing of an employee seeking transfer or promotion to positions involving the use of firearms for the interdiction of drugs. Much of the legal action in this area has centered on what constitutes a special government need sufficient to override public employees' and applicants' Fourth Amendment privacy rights. The courts have held that certain types of positions create a "special need" which justifies random drug testing of employees in those positions. In addition, positions that are sensitive with respect to government security and law enforcement, such as those in which employees are required to handle classified material, or carry firearms, may justify drug testing of the employees without individualized suspicion. Public sector human resource managers would be well advised to check the law regarding drug testing in their federal judicial districts and circuits because what is permissible may continue to vary among the lower courts.

The legalization of marijuana in certain states for medical and recreational uses has complicated the law in this area. Marijuana use is now legal in 23 states and the District of Columbia, with four states – Alaska, Colorado, Oregon, Washington – and the district permitting recreational use. The other 19 states have legalized marijuana use for medical purposes, though their laws vary. In addition, federal and state statutory protections for workers vary considerably. There are federal laws that protect employees, like the Americans with Disabilities Act, as well as a number of relevant state laws that protects employees' legal, off-duty conduct. Yet all these acts specifically exclude from disability any employee or applicant who's currently engaging in the illegal use of drugs. Other federal laws compel employers to prohibit the use of marijuana on the job, for example, President Ronald Reagan issued an executive order in 1986 creating a federal drug-free workplace. In addition, the Drug-Free Workplace Act of 1988 requires employers to maintain a no-drugs environment in order to become a federal contractor or receive federal funding. In fact, it is worth noting that no state requires employers to permit employees to be under the influence of marijuana on the job.

In *Coats v. Dish Network*, the court held the state's "lawful activities statute," which generally prohibits employers from firing employees for engaging in lawful activities off the job, applied only to activities lawful under Colorado and federal law (350 P. 3d 849 (Colo. 2015)). The court held that because marijuana is illegal under the federal Controlled Substances Act, its use isn't lawful – and can remain a valid basis for termination in the state. Although *Coats* addressed one specific state legal issue triggered by the loosening of marijuana laws, there are a number of yet to be resolved questions about how employers must treat marijuana use under state and federal employment laws, including disability laws.

Civil service or personnel rules and collective bargaining agreements may provide protections

that are similar to those provided by statute, such as rules regarding how drug and alcohol test may be administered.

## Personnel Files

The federal Freedom of Information Act (FOIA) and similar state laws permit the broad disclosure of government records subject to specifically enumerated exceptions. Among the nine categories of records specifically exempted under FOIA from disclosure, section 552(b)(6) is "personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy." Courts have chosen to err on the side of disclosure by placing a high burden upon government agencies that invoke the invasion of privacy exception: First, the agency must demonstrate that the information at issue is in fact included in a personnel, medical, or similar document. In addition, the agency must demonstrate that release of the information would violate "substantial privacy interests" of the person involved. Then, a balancing test is used to weigh the "substantial privacy interest" against the interests of disclosure as mandated by FOIA's purpose of opening "agency action to the light of public scrutiny," with the added hurdle that the invasion must be "clearly unwarranted" rather than being merely "unwarranted." (*Sims v. C.I.A.*, 642 F.2d 562, 572 (D.C. Cir. 1980). Even if information is contained in a personnel, medical, or similar document, the entire document is not conclusively exempt. Plaintiffs can show that only the truly private information should be withheld, by way of redaction. See *Dep't of Air Force v. Rose*, 425 U.S. 352, 381–82 (1976)). Lastly, courts are instructed to "tilt in the favor of disclosure" when applying this test because their purpose is to enforce the congressionally determined balance in favor of disclosure (*Getman v. NLRB*, 450 F.2d 670, 674 n.11 (D.D.C. 1971) ("The legislative history suggests that use of the 'clearly unwarranted' standard is the expression of carefully considered congressional policy favoring disclosure.")).

## Employee Recourse for Invasion of Privacy

Employees' recourse for violation of the right to privacy is through the courts and a lawsuit, either seeking a court order to prohibit the conduct or compensation for any damage the employee may have of the invasion of privacy. Statutory protections also may be enforced through litigation, whereas personnel rule violations may be remedied through appellate procedures contained in civil service rules, with the determination made by an independent commission or board. If the privacy issues are raised in a grievance, it will often be subject to binding determination by neutral arbitrator. Even when a public employee can prove a constitutional violation against his employer, the employer is frequently held not liable based on governmental immunities.

# Private Law and Public Administration

Geo Quinot
Stellenbosch University, Stellenbosch, South Africa

## Synonyms

Civil law; Contract law; Law of delict; Law of family and persons; Law of obligations; Law of succession; Property law; Tort law

## Definition

Private law is that part of law that governs the relationships between legal subjects (persons subject to the law) on a horizontal level, i.e., the relationships between parties with equal legal power.

## Introduction

Private law is that part of law that governs the relationships between legal subjects (persons subject to the law) on a horizontal level. Theoretically, private law thus governs relationships between parties with equal legal power. In contrast, public law is that part of law that governs the relationship between the state and private persons on a vertical level. Public law is thus primarily concerned with the exercise of state power. The distinction between private law and public law is one of the most basic divisions in the domestic law of many legal systems.

In light of the basic description of private law and public law in the previous paragraph, it follows that state administration will largely be governed by public law (and in particular by the branch of public law called administrative law). Put differently, the state administration will generally act in terms of public law since the administration is tasked with fulfilling the state's obligations toward its citizens and functions within the vertical relationship between state and private persons.

However, the line between what is considered public and what is considered private has never been an absolute one and is increasingly been blurred by public administration activities that are typically governed by private law. For example, the public administration is no stranger to the private market where relationships are governed by private law. It follows that private law also plays an important role in public administration.

Private law is typically divided into a number of main fields (although there is certainly no set division of fields): law of family and persons, property law, law of succession, contract law, tort law/law of delict. Property law, contract law, and tort law (law of delict) are of particular interest to public administration.

## Property Law

Property law is that branch of private law that governs the relationship between legal subjects and their possessions vis-à-vis all other legal subjects. Since public administration inevitably involves dealing with state assets, property law plays an important role in this area. In many instances the state is simply viewed as another property owner or user like any other so that the relationship between the state and its assets in relation to all other legal subjects is governed by the same property law that applies to private parties. Within the public administration function, property law will thus play an important role in determining what can be done with state assets and how it can be done. In this way property law becomes part of the legal framework in terms of which public administration occurs. For example, the way that the administration goes about establishing a physical location for its activities will largely be governed by property law: the administration may use premises that it owns if property law (e.g., planning law) allows such usage of the particular premises, or it may rent facilities from a private property owner in terms of property law (particularly landlord and tenant law), or it may buy suitable land or buildings using property law (specifically law governing sale of property). In these instances the private law rule framing the public administration's actions will be very similar, if not identical, to that applying to any other legal subject (e.g., a private retailer) in establishing facilities for its activities.

There are, however, aspects of the public administration's relationship with its property, especially vis-à-vis citizens dependent on public services, that call for distinct treatment in terms of property law. In these scenarios ordinary private property law seems inadequate to provide a complete framework for the relevant relationships. Additional legal rules are required to supplement

ordinary property law either by means of regulation or by modified interpretation and application of the ordinary rules. A good example is the public administration's management of public housing stock or more generally how the public administration deals with its property in relation to the need for housing, especially by the indigent. In these scenarios the public administration's obligations cannot simply be viewed as equal to those of a private landlord so that property law that would generally govern the relationship between a landlord and tenant in relation to the property would not be wholly adequate to serve the public administration's needs.

Justice Albie Sachs of the South African Constitutional Court eloquently explained the need for a distinct approach to the property law relationships of the public administration in the judgment of *Residents of Joe Slovo Community, Western Cape, v Thubelisha Homes* (2009) ZACC 16; 2009 (9) BCLR 847 (CC); 2010 (3) SA 454 (CC) as follows:

> In my opinion, the question of the lawfulness of the occupation of council land by homeless families must be located not in the framework of the common law rights of landowners, but in the context of the special cluster of legal relationships between the council and the occupants established by the Constitution and the Housing Act. The common law might have a role to play as an element of these relationships, but would not be at their core. The very manner in which these relationships are established and extinguished will be different from the manner in which these relationships might be created by the common law, for example, through contract, succession or prescription. They flow instead from an articulation of public responsibilities in relation to the achievement of guaranteed social and economic rights. Furthermore, unlike legal relationships between owners and occupiers established by the common law, the relationships between a local authority and homeless people on its land will have multiple dimensions, involve clusters of reciprocal rights and duties and possess an ongoing, organic and dynamic character that evolves over time (footnotes omitted).

## Contract Law

Contract law also plays a key role in public administration. Public administrations participate in the marketplace in ways that are very similar to other private commercial actors (e.g., consumers or companies). For example, administrations acquire and dispose of goods and services; they enter into financial arrangements and conclude partnerships. In all these transactions, the administration utilizes the primary legal mechanism to create commercial relationships, namely, the contract. However, although the public administration may appear equivalent to any other (powerful) market participant when engaging in these transactions and their contracts thus seem to be equivalent to any other commercial contract, these arrangements involving the public administration remain distinct from "normal" commercial transactions (Quinot 2008). Due to its unique status and position in any given society, the public administration is never wholly equivalent to other (private) legal actors with the result that its legal relationships are also distinct. Many legal systems have recognized this distinctiveness of the commercial relationships of the public administration by developing a distinct concept of a public contract. The French concept of the *contrat administratif* is a prime example (Turpin 1999; Maree 2013). However, many legal systems do not recognize a distinct legal concept of a public contract and rely on the private law rules of the ordinary commercial contract to also govern the administration's commercial dealings. Even in those systems that do recognize the distinct concept of a public contract, the public administration may still conclude ordinary commercial contracts that would be governed by the ordinary private law of contract. Finally, while the rules governing distinct notions of a public contract are different from the ordinary private law of contract, those rules are still, to a very large extent, based on the ordinary private law of contract either because it developed from the latter or because it simply amounts to the ordinary private law of contract with an overlay of administrative law (Turpin 1999).

It is clear that even though the public administration's commercial dealings may differ from equivalent dealings by private parties, the rules that govern those transactions are largely private law based.

## Tort Law/Law of Delict

The third area of private law that is of particular importance for public administration is that of tort or in some systems known as the law of delict. This is the branch of private law that governs the relationship between legal subjects in relation to wrongful action. It is largely aimed at ensuring that the person that caused the damage is liable to the person that suffered the damage.

It is inevitable that public administration will from time to time result in damage to private persons. For example, damage may occur when a person falls into an open drain in a public street, or when a doctor in a public hospital fails to exercise the necessary level of care in treating a patient, or when a person is mistakenly arrested and detained, or when a public bus collides with a private vehicle. In all these scenarios and many more that one can think of, the public administration may be liable for the damage caused by its actions. In these cases the private law of tort may govern the relationship between the public administration and the person that suffered the damage.

Again, as with the two areas of private law noted above, the application of tort law to the public administration is not wholly equivalent to its application in purely private settings, that is, between private legal subjects. In recognition of the distinctiveness of the public administration in attracting liability for wrongful action causing loss, the application of tort law to the public administration is often referred to as state liability law. Many legal systems impose special conditions on the liability of the state (including the public administration) in relation to damages claims. For example, it is fairly common to find that there are special notification rules that would require a person wanting to claim damages from the public administration to give a particular form of notice to a certain public office of its intention to bring such a claim. One also commonly finds restrictions on how damages claims can be enforced against the public administration. It is widely recognized that the type of enforcement that is generally available against a private person found liable for damages caused to another cannot be followed in relation to the state administration. Typically, when a claimant has obtained a damages judgment against a defendant, it can execute that judgment by attaching any of the assets of the defendant and selling those assets to compensate for the damages, i.e., to satisfy the judgment debt. However, it would lead to fairly chaotic results if those who have obtained damages judgments against the public administration could simply attach any of the assets of the public administration (e.g., government vehicles or planes or medical equipment) to satisfy the debt. As a result there are thus often rules in place that would limit the method of how damages claims can be enforced against the administration where the administration refuses or neglects to pay.

The liability of the state in tort has also developed along some distinct lines from ordinary private law, because of the influence of the English law maxim that the "King can do no wrong" ("rex non potest peccare"), which has influenced many legal systems. This maxim, more accurately described as a doctrine of sovereign immunity, effectively provided immunity to the Crown against damages claims, which extended to the entire public administration, which was effectively done in the name of the Crown. In England, it was thus only with the introduction of the Crown Proceedings Act of 1947 that a more general state liability regime emerged (Fairgrieve 2003).

## Conclusion

While public administration fulfills a unique function in any society, it does not occur in a vacuum, separate from that society. Many of the activities of the bureaucracy in pursuing the function of public administration take place within the same legal and institutional context as the dealings of any other person (individual or firm) operating in that society. The methods used by bureaucracy to effect public administration are also often very similar, if not identical, to the methods used by private persons in pursuit of their own private

endeavors. It is accordingly not surprising that the law that frames the conduct of private legal subjects, i.e., private law, also plays a significant role in facilitating and controlling public administration.

In many instances the state can make use of the very same legal rules as private legal subjects to pursue its agenda in public administration. It can conclude contracts, deal with its property, and may attract liability for its actions along the way. However, the distinctiveness of public administration often impacts on private law rules when they apply in scenarios involving the administration. It is thus common to find that private law rules obtain a public (administration) or administrative slant when applied in the context of public administration.

# Privatization

Yurie Yokoyama
Department of Social Policy and Social Work, University of York, York, UK

## Synonyms

Governance; Marketization; Public administrative reform

## Definition

Privatization is defined by either financial or organizational aspects: the transfer of assets owned by government to the private and not-for-profit sectors, or the participation of these organizations in public service delivery which were previously limited to the government.

## Introduction

Privatization is the reconsideration of priorities in government intervention and redefines boundaries between the public and private sector. Privatization has appeared as one of the key features in Anglophone public administration reform since the 1980s due to economic stagnation, which required public expenditure reductions to balance budgets and ending government protection of declining industry. It has subsequently been adopted in countries facing similar economic issues, including formerly communist countries and Lower and Middle-income countries, where the World Bank and International Monetary Fund are influential advocates of privatization. They view privatization as a key solution to reform failing governments and to achieve economic recovery, and attached privatization to conditions for loans to countries facing sovereign debt crisis. These reforms may have contributed to stabilizing fiscal order and encouraging economic growth in these countries but also draw criticisms of unnecessary or excessive

privatization, ignoring social structure and historical background of recipient countries.

Though privatization is a global phenomenon, it takes a wide variety of forms depending on the political, legal, organizational, and economic context in which a specific target is privatized. Furthermore, privatization is applied to a range of public functions, including industries which have required a huge initial investment and protection to develop, for example, transportation, airport, and energy, but need fewer commitments from the government after services have matured. Privatization could also indicate the construction of public facilities, such as energy plants, public housing, and hospitals, using full or part-based direct investment from the private sector. In this case, the ownership of these facilities is vested in the government or is expected to return to the government when contracts are terminated. The target of privatization is not limited to public assets but also encompasses public services which could be either back office functions or services directly provided to citizens, including waste collection, education, health care, and social care. In this sense, privatization has a similar meaning as the marketization of public service delivery. In addition to these variations in forms of privatization, its rationale varies from case to case. Drivers of privatization include: reducing public expenditure by cutting back the government's role; gaining proceeds from sale of assets; introducing management knowledge and innovation developed in the private sector (for example, outcome measurement, consumer satisfaction, and technological development); improving efficiency and quality of service through competition among providers; and increasing user choice. Overall, privatization introduces market principles into the public sector.

## Means of Privatization

There are numerous means to implement privatization. In terms of asset transfer, this could involve sale of a public asset to private organizations or individuals. Sometimes public assets are managed at arms-length by a state-owned enterprise rather than the government itself. In that case, transferring the ownership of the enterprise from the government to the private sector is another way of privatization. Stocks, loans, limited partnerships, joint ventures, and other financing schemes developed in private markets are used to privatize public assets, either individually or in combination. For example, when the national railways were privatized in the United Kingdom (UK) in the late 1990s, basic infrastructures such as tracks, signals, and stations were transferred from British Rail, a state-owned enterprise providing railway services, to a newly established railway company, and then the government sold off its stocks in the stock exchange market in 1996 to complete privatization (Gourvish and Anson 2002). Engines and carriages were sold to rolling stock companies, which had been established as state-owned enterprises, to lease them to passenger service companies, and these rolling stock companies were sold to the private sector (ibid.).

Privatization of public services could be implemented by contracting out a part of the service to private organizations. For example, local governments in some countries are responsible for waste collection and commission private companies to deliver it, thereby replacing direct service provision. Another form of privatization is granting a concession to manage a public facility, for example, airports, water plants, and libraries to private organizations by contracts. Unlike the privatization of a facility itself as an asset, the main focus becomes services provided by the facility, and the facility still remains government-owned.

Moreover, contracts between the government and private organizations are not necessarily a prerequisite of public service privatization. For example, in 2000 Japan introduced a long-term care public insurance system replacing conventional services provided directly by local governments or organizations commissioned by them. The model allows eligible elderly people to receive care services from a wide range of providers, which meet requirements and get approval to enter the elderly care market (MHLW 2016). In the UK, the government has introduced personal budgets for adult care so that people could purchase necessary services from private organizations other than services commissioned by local

governments (NAO 2016). In these cases, there is no direct contract between local governments and service providers, but changes could be perceived as a form of privatization.

Removing barriers to enter markets or terminating the government's monopoly by deregulation could also be recognized as having characteristics associated with privatization. Where a state-owned enterprise monopolizes energy supply, opening the energy market to private organizations would be one way to introduce competition into public services and increase user choice. It should also be noted that privatization in assets and that in services are sometimes undertaken simultaneously. During the UK railway reform in the late 1990s, the passenger service was delegated to private companies which won the competitive bidding and agreed franchise contracts between the government (Department for Transportation 2004). Thus, the terminology of "privatization" needs to be interrogated carefully because it takes a variety of forms and serves different objectives.

## Advantages and Disadvantages of Privatization

Privatization has been presented as a solution to structural problems of the public sector, such as budget restraint, cost-inefficiencies, and limited service choice. In many cases, privatization has been argued to benefit service users and taxpayers. The UK government argued that privatization attracted large investments including new rail line construction and upgrades of existing line, which could not have realized in the nationalized industry (Department for Transportation 2004). Privatization has also contributed to improve passenger services by increasing the number of journeys and diversifying the ticket options for off-peak travels (ibid.).

On the other hand, privatization has drawn a series of criticisms: less affordability of service; decline in service quality; conflict between profitability and requirements originating from public characteristics of assets or services such as equity among service users; blurred accountability of the government; and lack of actual competition (Dassiou et al. 2015; Smith and Jones 2015) . First, prices or charges for facilities or services may rise after privatization, and some privatization may involve charges for services previously provided for free. It is essential for a private organization to make the privatized business profitable and price rises or new charges may be unavoidable in some cases. Nevertheless, if these privatized facilities or services are indispensable for daily lives, the additional payment could be a considerable burden on people especially those with low incomes or in precarious employment.

Second, privatization does not automatically improve the quality of public assets or services and may even lead to deterioration in quality. There are many examples of service quality decline following privatization driven by a focus on short-term profitability, excessive pursuit of cost-efficiency, or lack of coordination among fragmented providers. The Department for Transportation (2004) admits that insufficient knowledge and investment on tracks of the railway company succeeding British Rail was one cause of the Hatfield rail accident in 2000.

Third, there is a fundamental contradiction between rational economic decisions in the market and the demand to secure values, such as equality and universality, originating from remaining public characteristics in privatized assets or services. For example, within privatized social services, those providing the services may focus on users who are likely to bring larger profits regardless of each user's service need.

Fourth, privatized facilities or services may be closed or withdrawn when they become unfeasible for the private organization managing them. For example, in some countries the withdrawal of elderly care home providers caused unwilling transfer of the residents to other care homes, and sudden bankruptcy of a provider in a privatized electricity market lead to blackouts. Ensuring service continuity in a privatized market may incur the government additional costs including public financing or even re-nationalization as a last resort.

Fifth, privatization blurs accountability of the government to the parliament and the general public. Privatization is typically accompanied by transfer of discretion to manage privatized assets

or services out of the government. Contracts for privatization and/or related legislation usually stipulate the lines of accountability between the government and private organizations. However, in practice, it is not always clear who is to solve problems regarding the privatized asset or service. Accountability issues are likely to be more salient when the government still supports private organizations with public money. Moreover, even if the private organizations make the most desirable decision regarding their role in the market, it is sometimes difficult for them to redress deep-seated problems arising from the overall market structure.

Finally, privatization does not necessarily achieve real competition among private organizations. With the privatization of large public assets such as railways and power plants, it is possible that only one or a few private organizations are capable of managing the assets. It might be partly due to bidding criteria on turnover, capital size, and technical capacity, which are sometimes necessary to guarantee financial and administrative feasibility of the privatized business. Alternatively, even when apparent competition among the private organizations exists at a regional level, the market could be dominated by subsidiaries of a large company at the national level. Lack of competition increases financial risks to government and undermines the legitimacy of privatization.

## Privatization and the Emergence of New Governance Arrangements

In the process of privatization, new governance structures are introduced aiming to prevent or minimize market failure. Thus, typically new regulations on privatized assets or services are established, linked to market structure and the primary aims of privatization. There may be minimum requirements for entering the market or basic standards on quality and safety in order to maximize free competition in the market. On the other hand, public characteristics remaining in privatized assets or services usually require a guarantee of essential principles such as universality and equality in service, and additional regulations are necessary to avoid private organizations overriding these principles. These include pricing rules, procedural requirements for withdrawal to avoid a service vacuum, and legal framework for government emergency intervention. In addition to contents of regulation, there is the question of who is to regulate. The regulator may be either government or a public body independent from the government. During UK railway service privatization in the 1990s, two regulatory bodies were established: the Office of Passenger Rail Franchising was in charge of establishing and monitoring franchise contracts for the passenger service; the Office of the Rail Regulator was responsible for regulating access to track and stations, and managing licenses regarding the whole rail network, trains, and stations (Gourvish and Anson 2002).

Secondly, the government may introduce new market oversight schemes inside the government or an independent public body, sometimes combined with regulatory functions (Hardiman 2012; Dassiou et al. 2015). The level of oversight depends on market characteristics. In some cases, the oversight body aims to secure free and fair competition in the privatized market, though applicability of competition law to the privatized market is still controversial. In other cases, an oversight body checks financial stability in the market and is expected to issue an early warning to stakeholders on the withdrawal of a hard-to-replace provider. Alternatively, an oversight body may focus on benchmarking quality of privatized assets or services for users to promote better quality through competition or aim to secure value for public expenditure in the whole privatized system by making recommendations to the government.

A third arrangement involves management tools to control the outcomes or to promote desirable competition in the market, for example, performance measurement with regular evaluation. Where the government directly agree contracts with the private organizations or the market is heavily subsidized by the government even after privatization, financial incentives are usually combined with performance evaluation. Nevertheless, establishing appropriate measurement is not straightforward, and distorted performance measurement risks unexpected side effects.

## Conclusion

Privatization is a cornerstone of public sector reform bringing market discipline and innovation to what are seen to be failing or under-performing public services. However, there is no standardized pattern for privatization, and its form and process are shaped by political climate, legal systems, organizational settings, and economic system. Privatization benefits are seen to include those of attracting large private sector investment and in providing more tailored service for users. On the other hand, privatization may give rise to new problems such as price rises, declining service quality, and gaming behavior by private organizations, which primarily result from the market structure after privatization.

Privatization was perceived an effective measure for scaling down the governmental role, but in practice rarely results in complete withdrawal of government from the privatized business. Public characteristics typically remain in the privatized assets or services, and thus new arrangements are essential to avoid private organizations overriding essential values originating from these public characteristics, such as service universality and equal accessibility of users. They are also necessary to maintain safety standards; to promote better quality of services; and to hold the government accountable regarding the privatized assets or services. New arrangements could be regulations; market oversight scheme; outcome measurement; and evaluation schemes. In brief, privatization is the reconfiguration of the government role from direct provider of public assets or services to supervisor of quasi-private markets by partial ownership or indirect governance.

## Introduction

This chapter describes a series of public reforms in Japan since the 1980s. This reform includes the introduction of the market mechanism, the performance evaluation, and the division of decision-making and implementation. This chapter focuses on the introduction of the market mechanism: privatization and deregulation.

Firstly, privatization was held in the 1980s and the 2000s. The process of privatization includes not only just selling public corporations but also subdividing a company. Methods of division include horizontal separation and vertical separation. Horizontal separation refers to separate a public corporation by region, such as west,

central, and east, or by function of business, such as a passenger company and a freight company. Vertical separation refers to separate a public corporation into a company which obtains infrastructure and a company which uses it. The process of privatization has raised political conflict between the pros and cons of privatization because privatization of public corporations would affect the allocation of pork-barrel among beneficiaries. In recent years, furthermore, the government has introduced another type of privatization, the concession system, to operate public facilities. A good example of this is the airport PFI introduced by the Democratic Party government.

Secondly, about deregulation there are also various cases because in terms of devising economic policy, the Japanese Government had preferred regulatory frameworks to nationalization of industry after World War II. Civil aviation and finance policy, for instance, had regulated business licenses, prices, and so on. Because of changing economic circumstances, the government, however, changed its policy from the late 1980s. In the civil aviation industry, the government gradually eased the regulations mentioned above. The Hashimoto government conducted the Financial Big Bang, which ended the "convoy system" in the postwar Japanese finance industry.

## Privatization Overview

In the 1980s, as in other developed countries, the Japanese government privatized state-owned companies (hereafter SOCs). As Obinger et al. (2016) argue, privatization of SOCs can be of two types. One involves the selling of the properties of an LOC. The other refers to a change in the legal status of the LOC. The Japanese government preferred to choose the latter type. This is because most cases were for reforming business, which was struggling and had huge amounts of debt. Furthermore, the executives of the government were wary of the resistance they would have to face from backbenchers who were against privatization in order to reserve their pork barrel for their beneficiaries. Section "Privatization Overview" describes five cases of privatization in Japan since the 1980s. These are the national railways, telecommunication, highway agencies, postal services, and airports.

### The Nakasone Government

The Yasuhiro Nakasone government (1982–1987) privatized three public corporations. This section explains two typical cases of privatization of public corporations: Japan National Railways (hereafter JNR) and Nippon Telegraph and Telephone Public Corporation (hereafter NTTPC). The privatization of JNR was meant to reform a public corporation whose management had collapsed as the railway industry was in shambles. The other, the privatization of NTTPC, was, on the contrary, privatization in which the management was good and the industry had a bright future.

#### Japan National Railway

From the administrative, political, and economic points of view, the reform of JNR was considered the most difficult task for the Nakasone government. First, in the administrative sphere, the management of JNR had completely collapsed. The amount of annual operational losses and accumulated debt was incredible. In 1986, JNR's annual income from the railways was 3.2 trillion yen, but the annual cost was 4.6 trillion yen. When JNR became privatized in 1987, its accumulated long-term debt was 37.1 trillion yen.

Second, from the political point of view, politicians of both the right, the Liberal Democratic Party (hereafter LDP), which was the governing party, and the left, the Social Democratic Party of Japan (hereafter SDPJ), had intervened in JNR. The LDP politicians demanded that JNR construct railway lines for their constituencies although it would lead to losses, and the LDP along with the local authorities did not permit the closure of loss-making lines in the rural areas. The SDPJ insisted that the government and JNR freeze the rising fares from the welfare point of view, although JNR could not afford the inflation. They, furthermore, supported trade unions in their strike against the executives of JNR. Trade unions of JNR were hostile to the executives and went on

strikes to disrupt JNR executives. This disruption resulted in confusion among railway users.

In the transportation market, JNR lost its competitiveness against both other railway companies and road transport services for both passengers and freight. In the first case, the loss was because of the disruption caused by the strikes. In the second case, the government proceeded to undertake road construction and the development of the automobile industry.

Privatization of JNR was meant to resolve these complicated problems. However, people who were part of the discussion process of privatization did not necessarily have confidence that privatization would salvage JNR (Kasai 2003). The Nakasone government chose a horizontal separation and split JNR into six passenger railway companies (JRs) and a freight company. The government did not introduce vertical separation, like in the UK and the EU countries. However, privatization of JNR resolved these issues beyond their expectations. Especially in metropolitan areas, such as Tokyo and Osaka, JNR recovered competitiveness to other private railway companies. Except for dealing with the increasing consumption tax, three JR companies, East, Central, and West, have not raised their fares since privatization. In the inter-city services, the *shinkansen*, the high-speed train network, has been beating civil aviation. Politicians found it difficult to intervene in the investment plans of JR companies without the fiscal resources for construction (Takamatsu 2006). In 2017, 30 years after privatization, four out of the six JR companies listed their stock in the market.

### Nippon Telegraph and Telephone Public Corporation

In contrast to the case of JNR, the telecommunication industry had a prosperous future ahead because of the foreseen development in communication technology. Unlike JNR, the NTTPC operated in the black. Rather, restrictions introduced by the government were considered to impede free and efficient business activity. The NTTPC's business had been controlled by the Diet or the Ministry of Posts and Telecommunications because it was a government corporation. These restrictions on the NTTPC included permissions for the annual budget, investment, and fund usage.

The telecommunication industry was a natural monopoly and therefore, monopoly by the public body was justified. Under the system of a public monopoly, the government implemented construction of telecommunication network infrastructure. The development of the network and technology, however, reduced the need for state monopoly. In other words, unlike JNR, which was a reform meant to remove the deadlock, this one was in preparation "for the twenty-first century" and corresponding to the rapid growth of telecommunication technology and its market (Otake 1994).

In 1985, the Nakasone government privatized the NTTPC to Nippon Telegraph and Telephone Corporation (hereafter NTT) and in 1987 listed its stock on the market. Because of the bubble economy, the share of the company became extremely valuable to individual investors. Selling NTTPC to NTT, the government earned about 10 trillion yen. However, the government also set two restrictions on NTT capital. The government would keep the lions' share, which is more than a third, because the telecommunication infrastructure was important for national security. The government also set restrictions on foreign capital investment in NTT.

Simultaneously, the government eased regulations to enable entry of other enterprises into the telecommunications market. Many New Common Carriers (hereafter NCCs) were established, and they entered the market, especially the long-distance call market. To accelerate the entry process for the newly joined, the government created a new business category, by which a company did not need to hold infrastructure by itself but instead could lease it from a company that held it. Furthermore, for starting the business, the company needed to only register with the Ministry.

Although NCCs built up the long-distance call network by themselves, for the last one mile they had no choice but to depend on the network owned by NTT, their competitor. Conflict arose when they had to connect their network with that of the NTT. The Ministry of Posts and

Telecommunications realized that competition between the two would be unfair, because the last one mile infrastructure monopolized by the NTT. Moreover, with the emergence of new technologies, such as the Internet, mobile communications, and optical fibers, the Ministry reexamined the state of NTT. In 1997, because of lack of competition in the telecommunication industry, the government revised the privatization scheme and divided NTT into four companies, a holding company, two regional companies, and a long-distance call company.

## Koizumi Government

The Junichiro Koizumi government (2001–2006) also tackled privatization of government-affiliated corporations. This section describes two highly politicized cases, privatization of the highway agencies and the postal services. A characteristic feature of these cases is that in privatizing the two, there was conflict not only between PM Koizumi and the opposition party but also between the PM and the backbenchers of the LDP, whose interests apparently suffered by privatization.

### Japan Highway Public Corporation

Highway construction has long been the source of patronage politics by the LDP. The LDP politicians initiated a long-term development plan to construct a highway network of 9,342 km across Japan. Japan Highway Public Corporation (hereafter JH), constructed the highway and operated it.

Although the highway network contributed to the economic development in Japan, a few routes were not economically viable. Some routes, especially in the rural areas, could not afford the construction cost due to the limited usage. The construction of such routes became a burden on the JH management, which had about 40 trillion-yen interest-bearing debt. The LDP members whose constituencies were situated in such rural areas, however, strongly demanded that the government continue constructing the remaining planned routes.

Therefore, when PM Koizumi mentioned privatization of JH, it was expected that the construction of new routes would no longer be possible. This was because a private company would naturally avoid loss-making businesses and, in fact, JR companies, the predecessors of privatization, had stopped railway construction in rural areas and had been shutting down loss-making lines. Hence, political conflict arose between Koizumi and the backbenchers who supported highway construction. The Committee for the Privatization of Highway agencies, whose members were appointed by PM Koizumi, discussed the scheme of privatization and sought to prevent the construction of loss-making lines.

The backbenchers of the LDP, who finally understood that privatization was inevitable, strongly insisted that the government introduce vertical separation and an infrastructure holding company of public-related bodies to continue highway construction in public interest, not private interest. PM Koizumi finally compromised with the backbenchers and accepted their demands.

In 2005, the government decided to break up JH and other highway agencies and privatize them into six highway companies. As per the LDP members' preference, an independent administrative agency, named the Japan Expressway Holding and Debt Repayment Agency, was established to hold highway infrastructure and repay interest-bearing debts inherited from Japan Highway. Thus, the highway assets were given on an agency lease to five other highway companies, which managed and operated the highway business and the lease fees were paid to the agency. These companies were also involved in the construction of new highway routes, which would then be transferred to the agency along with its long-term debt from the construction. By this system, highway companies would avoid the burden of the debt, and hence, they had an incentive to expand their network. In other words, a new highway line would continue to be built in accordance with the 9,342 km Scheme.

### Japan Post

Reforming the Japanese postal services was Junichiro Koizumi's political lifework. He had already begun to appeal for postal privatization in the 1980s, when he was the Parliamentary Vice-Minister for Finance. This opinion, however, had

seen hostile reaction from the other members of the LDP, because quite a few LDP members depended on the support from the Association for Small Post Office Masters (hereafter *Zentoku*). In 1871, the Meiji government introduced a postal service between Tokyo and Osaka, which was the start of the modern postal service in Japan. Since then, the postal services in Japan had been undertaken as a government business. To expand the postal network, the Meiji government appointed local magnates, who donated their land and building for the post office to the government, as owners of Small Post Offices and gave them the status of a national public servant. Later, they formulated the *Zentoku* to keep their benefits and became strong supporters of the LDP. If the postal service became privatized, they would lose their position as a national public servant as they feared that the loss-making small post office would become abolished.

When he became the prime minister, Koizumi moved into action to achieve his ambition and submitted the Postal Privatization Bill to the Diet. However, the process that he and the executives of the LDP had taken was a deviation from the intraparty legislative procedure that the LDP usually took. Therefore, the LDP members who opposed privatization insisted that the executives could not declare that and the LDP members must vote in favor of the party decision. In the House of Representatives, although there was rebellion from the LDP, 37 oppositions and 14 absentees, the bill was approved by a slim margin with the support of 233 votes and opposed by 228 votes. In the House of Councilors, however, the bill was rejected with only 108 votes in support and 125 votes opposing it. The rebellion from the LDP was 22 oppositions and 8 absentees.

PM Koizumi dissolved the House of Representatives on the same day and asked the electorates whether the postal service should be privatized. In the general election campaign, Koizumi made maximum use of his right to choose the LDP candidates and did not give party tickets to those who had opposed the postal privatization bill. Furthermore, he nominated rival candidates to them. The result was a landslide victory for the LDP, which secured more than two-thirds majority in the House of Representatives. This majority could help in passing the bill in the House of Representatives even if the House of Councilors rejected it. At the special Diet session after the election, the Postal Service Privatization Law was approved by both Houses.

The postal services were privatized with both vertical and horizontal separation. As a holding company of the Japan Post Group, the government established Japan Post Holdings. Japan Post Network obtained the postal network infrastructure, post offices. Using this infrastructure, three operative companies, Japan Post Service, Japan Post Bank, and Japan Post Insurance, ran their respective businesses. The law required Japan Post Holdings to sell all the stock of Japan Post Bank and Japan Post Insurance by 2017.

In 2009, however, the Democratic Party of Japan (here after DPJ) led by Yukio Hatoyama won the general elections and his government decided to review the postal privatization scheme. Until the government decided upon it, the listing plan was frozen. In 2012, the parliament passed the Japan Post Privatization Amendment Law, which removed the deadline for selling all stocks to the market.

In 2015, a holding company, the Japan Post Holdings, and its subsidiary, Japan Post Bank, were listed to the Tokyo Stock Exchange, and they sold a small part of the stocks to the market.

### Privatization of International Airports

As in many other countries, in Japan most of the airports were constructed and operated by the central and local governments. The Ministry of Transport held the power to decide and approve the location and plans for airport construction every 5 years. It permitted local governments to construct new airports or expand the existing ones. This institutional framework changed alongside the deregulation of civil aviation mentioned later.

The exception to this was the three international airports, Narita, Kansai, and Chubu, which were operated by special public corporations. In the early 2000s, the Ministry of Land, Infrastructure, Transport and Tourism (hereafter MLIT) had to tackle the privatization of the New Tokyo International Airport Authority (hereafter NAA),

which operated the Narita Airport, and the financial trouble of the Kansai Airport Company.

First, the Koizumi government decided to examine the possibility of privatizing all government-owned companies, including the three public companies operating Narita, Kansai, and Chubu airports, respectively. The MLIT sought to privatize the Narita Airport Company to salvage the Kansai Airport Company, which was in financial trouble. Because this airport was constructed on reclaimed land along Osaka Bay, the Kansai Airport Company had incurred a huge amount of interest-bearing debt, about 1.3 trillion yen in 2006, which had a negative impact on the management of the airport. Furthermore, the weak economy in the Kansai area led to the number of passengers to the airport fall far below the government's expectations.

The MLIT intended to merge the three existing international airport companies, Narita, Chubu, and Kansai. This plan, however, was criticized because it involved a cross-subsidy from the surplus of Narita to the deficit of Kansai, and hence it would reduce the competitiveness of the Narita airport. The MLIT then withdrew the scheme and privatized the NAA as the Narita International Airport Corporation in 2004.

Even after the privatization of Narita, the financial problems of Kansai Airport persisted. A proposal for resolving this problem stemmed from a local government (Takamatsu 2016). The Osaka-prefecture Governor Tohru Hashimoto proposed closing down of the Osaka International Airport (hereafter Itami Airport). This airport is located in the Kansai area, same as the Kansai Airport, and close to the city center and hence convenient for a multitude of passengers. However, Itami Airport had been the cause for high levels of noise pollution, and therefore, the governor felt that residents around the airport might approve his proposal. To the contrary, Kansai Airport is located in far from the city center to avoid noise pollution. In fact, after opening up Kansai Airport, there had been plans to abolish Itami Airport. However, the governor of Hyogo prefecture opposed this proposal because the abolition of Itami Airport would reduce convenience for passengers for Kansai region. Conflict between Osaka and Hyogo prefectures led to frustration and failed to reach an agreement at the local government level.

The MLIT proposed a merger of both airports and privatization by using a concession system. Under the concession system, the government does not transfer the proprietorial right of an airport to a private sector and maintains a contract to grant the right to operate infrastructure over a long period to the private airport operating company. Both governors accepted this proposal. The DPJ government amended the PFI Act, in which the object facility was expanded to the airports and seaports.

## Deregulation Overview

To recover from the devastation of World War II and conduct postwar economic policy reforms, the Japanese government preferred to the implementation of regulatory frameworks rather than the nationalization of industry. This policy is said to achieve certain results (Johnson 1982). However, the government implemented deregulation in a variety of industries since the 1980s. This section explains two important deregulation policies: the civil aviation and the financial big bang. Both of them are related to the Japanese economic policy post the 1980s.

### Civil Aviation

The Ministry of Transport introduced a regulatory framework in the civil aviation industry called the "45–47 system" in the 1970s. This framework was for the "protection and fostering" of the civil aviation industry, which was an infant industry at the time (Akiyoshi 2007).

The Ministry of Transport controlled the civil aviation market by four regulatory institutions. First, with regard to entry regulation, the Transport Minister held the sole authority to issue permission for an airline that wanted to start a new line. In fact, the Ministry did not give permission easily, because a new competitor might confuse the market. Second, the Transport Minister also held the power to permit changes in the fares and charges such that a consistent profit was obtained

for the carriers. Third, the Ministry of Transport controlled even the number of flights in each line. It set high standards for airlines when they wanted to increase the number of flights. This was done to avoid over-competition. Last, the Ministry introduced a system in which lines were allocated to three airline companies. Japan Airline (hereafter JAL), the national flag carrier, to fly domestic trunk lines and the international lines; the All Nippon Airline (hereafter ANA), the second largest airline, to fly domestic trunk lines, local lines, and short-distance international lines; and Toa Domestic Airlines (hereafter TDA), a follower airline, to fly domestic local lines.

This system, however, was forced to change in the middle of the 1980s when the United States started to deregulate its civil aviation market. The idea may have spread to other countries (Akiyoshi 2007). In 1986, the Civil Aviation Council in the Ministry of Transport issued the "86 Report," which proposed to turn the aviation policy from protection to competition. In response to the Report, the Ministry of Transport made the following changes in policies.

First, the Ministry permitted ANA to operate in the international market. Second, the government introduced double and triple tracking of a domestic market if a particular line met the criteria for the number of passengers: 700,000 for double tracking and one million for triple tracking. Third, the government sold the shares of JAL to privatize it completely.

In the USA and Europe, after deregulation, new airline companies were established and newcomers such as Ryanair dominated the market. In Japan, however, newcomer and competition did not occur easily. In 1996, the first new airline, Skymark Airlines, was established, but it failed in 2015. In 2012, ANA established a low-cost carrier (hereafter LCC), Peach Aviation. After that various LCCs were established, such as Jetstar Japan and AirAsia Japan, and the Japanese domestic aviation market at last entered the LCC competition era.

### Financial Market

"The convoy system" introduced by the Ministry of Finance in the Japanese financial market illustrates the characteristics of the postwar Japanese economy. The Ministry utilized the power of approval and permission for various aspects of business, such as entry and price, and controlled the financial industry. The Ministry of Finance also introduced controls over classification of business categories and regulated interests and commissions. The Ministry controlled the business area of each bank via administrative guidance. Moreover, the foreign exchange market was also restricted by the Ministry.

This system resulted in the stabilization of the financial markets in Japan from the 1950s to the 1980s. This stability of the financial market enabled banks and securities to provide finance to industries in the period of postwar reconstruction in the 1950s and saw high economic growth in the 1960s and the early 1970s.

However, the collapse of the bubble economy in the early 1990s brought about a crash in the condition of banks, especially stemming from bad loans, which drove banks and securities into bankruptcy. This breakdown of the monetary institutions made it impossible for the Ministry of Finance to maintain this system.

To resolve this crisis and the confusion in the financial market, and revitalize it, the Ryutaro Hashimoto government formed a financial market delegation called the "financial Big Bang" in Japan from 1996. The keywords of reform were "free," "fair," and "global" (Mabuchi 2009). "Free" referred to the government's abolition of the various regulations such as interest rates, commissions, and entries for financial business. "Fair" referred to the government-introduced deposit insurance system and disclosure of information about banking organizations. "Global" referred to the government's liberalized foreign exchange.

The financial big bang resulted in, first, newcomers from other industries, such as IT companies or supermarkets, bringing a fresh new perspective into the market; second; through a process of competition and survival, banks that had lost their competitiveness were eliminated from the market; and third, the number of banking companies decreased from 1,117 in 1976 to 589 in 2008.

## Conclusion

This chapter described privatization and deregulation in Japan. In the first, the privatization in Japan tended to change a legal status of public corporation rather than to sell off a company. The case of NTTPC privatization that the government sold the share to the public coming only 2 years later of the privatization was exceptional. This is because privatization in Japan was mostly for the reconstruction of management or for PM's political ambition. Recently, however, by introducing the concession system into an airport management, the government, which was suffering from the prolonged financial difficulties, found the new fiscal resource to invest an infrastructure.

In the second, about deregulation policy, this was a major turning point for Japanese economic policy in postwar era. Until the 1980s, the government had implemented regulatory frameworks, by which the government had protected and fostered industries for the reconstruction and development of the postwar Japanese economy. The Japanese government, however, has changed its regulatory policy from protection to competition, because of the changes of circumstances surrounding Japan, such as globalization and collapse of bubble economy. Deregulation resulted in newcomers for competition and in elimination of losers.

## Synonyms

Generic management; Governance; New public management; Outsourcing; Private finance initiatives; Private sector management; Public-private partnerships

## Definition

New public management: Process in which business principles and private sector management techniques are transferred into the public sector in correspondence with, and based on, a neoliberal understanding of the economy and the State (Drechsler 2005, p. 95).

Privatization: Any action that transfers some or all of the ownership and/or control of state-owned enterprises to the private sector (Zahra et al. 2000, p. 511).

Public management: The merger of a normative orientation of traditional public administration and

P

the instrumental orientation of general management (Perry and Kraemer 1983, p. x).

## Introduction

Since the late 1970s early 1980s, Western governments have made attempts to reform the organization and management of the public sector. They do so by adopting a business-like approach as promoted by reform movements such as New Public Management (NPM). NPM postulates the neoliberal idea of business-like government which implies the transfer of private sector values and private sector management techniques into the public sector.

Supporters of NPM argue that Western governments have become too big, costly, inefficient, ineffective, overly bureaucratic, and too little responsive to public needs (Osborne and Gaebler 1992). In order to overcome these problems, and to enhance the efficiency, effectiveness, and legitimacy of the public sector, roughly two solutions are suggested. The first solution consists of a closer involvement of the private sector within the process of public service delivery via the application of privatization strategies. The second solution concerns the reform of the management and organization of the public sector and consists of the incorporation of private sector values and private sector management techniques and approached into the public sector.

## Privatization

The term privatization gained popularity between the late 1970s and 1990s with the rise of conservative governments in, amongst other countries, the United Kingdom, Australia, and the United States. Privatization can be considered as an organizational manifestation of the NPM that has been ascribed the potential to impede or even reverse the growth of government. Although Anglo-Saxon countries like Australia and New Zealand were first in embracing the privatization strategy, other Western countries like Sweden, the Netherlands, and France have adopted privatization strategies too as a "centerpiece of their national policies" (Zahra et al. 2000, p. 509). Privatization strategies have even been applied in developing countries since they are suggested to have "the potential to transform national economies, industries and organizations by infusing a spirit of entrepreneurial risk taking" and to support social progress and economic renewal and development (Zahra et al. 2000, p. 509). International comparative research demonstrates that differences between countries with respect to the degree, pace, and exact content of the privatization strategy are significant and that these differences reflect different political preferences, development stages, national cultures, and long-term development plans (Pollitt and Bouckaert 2011; Zahra et al. 2000).

Despite its worldwide application and its importance for public policy, the question of what privatization exactly refers to is not an easy one to answer given the concepts' ambiguousness. In academic literature, for example, privatization has been defined in both a narrow and a broad sense. Narrow definitions understand privatization as the transfer of ownership, decision-making authority, and control of state-owned enterprises from federal, state, or municipal governments to the private sector and private investors (Zahra et al. 2000, p. 511). Practical examples of privatization in the narrow sense are the transfer of ownership, decision-making authority, and control of public transportation, education, hospital health care, water and energy supply, and mail delivery. On the contrary, when privatization is defined in a broad sense, it entails much more than solely the transfer of ownership, decision-making authority, and control from the public to the private sector. In a broad sense, privatization entails any action that helps to increase the role of the private sector in the economy such as the sale of public assets, contracting-out, the provision of public services by private firms, deregulation, the implementation of public-private partnerships (PPPs), and the reduction of subsidies.

Critics argue that the term privatization is far too often used as a synonym for contracting-out and PPPs and that differences are neglected. They suggest it is important to take these differences into account since what is true for

privatization, does not need to be true for contracting-out or PPPs. Despite the fact that all three structures entail some sort of private sector influence, their institutional logic differs substantially. Contracting-out, for example, involves a temporary and singular principal-agent relation in which the public partner defines what, how, and by whom something must be done. In contrast to privatization in the narrow sense, asset ownership usually remains with the public sector that, as a consequence, remains in control by monitoring performance and replacing the contractor if necessary.

Whereas contracting-out implies "simple contracting" (i.e., one service is contracted out for a relatively short period to a single private party), PPPs imply "complex contracting" (i.e., an integrated contract for a relatively long period (between 15 and 30 years) is signed with a multiheaded consortium). Ownership, control, and decision-making authority remain with the public procurer in PPPs as well as the responsibility for service supply and service quality goes. In contrast, privatization entails that private firms make their own decisions on service supply and service quality. It is suggested that PPPs enable governments to control private sector performance to a far greater extent than is the case with privatization. In that respect, some argue that PPPs are not a manifestation of NPM but rather form an alternative to it. Some, however, consider that the term PPPs is nothing more than a language tool used as a substitute for the neoliberal or "Thatcherite" use of the word privatization that helps to neutralize the negative connotations of privatization.

With respect to these negative connotations, various scholars argue that despite the supposed benefits of privatization for public service delivery in terms of efficiency and effectiveness as articulated by proponents of NPM, privatization and related manifestations or actions might not be beneficial for the public interest at all and actually harm values such as transparency and service quality given the profit motive of private companies and their loyalty towards their shareholders.

In relation to transparency, for example, it is argued that privatization implies a switch from inefficient but transparent public property to not very efficient and less transparent public property and that privatization fails in terms of transparency because of a lack of regulatory oversight, inadequate ways of collecting data, and the absence of quantitative models that help governments to compare and measure private performance. In relation to service quality, some suggest that in the search for financial optimization, private firms will only provide minimum levels of quality. This quality-shading hypothesis assumes that private firms strive for financial optimization rather than service quality and that although market-like reforms might have increased efficiency, concerns with respect to the quality of service delivery remain.

With respect to the impact of privatization and related manifestations on public values and the overall contribution for public policy and public service delivery, it has been suggested that the bulk claims expressed in academic studies are based on normative ideas about NPM rather than on convincing empirical evidence of the actual functioning of organizational manifestations of the NPM reform. The little empirical evidence that is available provides contradictory claims. With respect to service quality, for example, several studies indicate it is maintained or even improved under privatization, whereas other studies provide indications for a loss of service quality. Hence, a definite answer to the question of whether privatization is beneficial for public policy remains out.

## Public Management

A second strategy postulated by supporters of the NPM that supposedly allows for the increase of governments' effectiveness, efficiency, and legitimacy concerns the reform of public sector management. Public management or, more specific, public managers are considered to be the center of organizational performance (Lynn et al. 2000). Public management reforms, the, are suggested to be a "force of progress" as they intent to optimize public managers performance and, as such, the efficiency and effectiveness of public service delivery.

Public management reforms merge "the normative orientation of traditional public administration and the instrumental orientation of general management" (Perry and Kraemer 1983, p. x). The normative orientation of traditional public administration refers to the classical Weberian bureaucratic model of public administration. One of its main features is its hierarchical structure which means that the highest level of authority is located at the top of the organization. Subordinate offices are controlled by higher offices that give orders and expect subordinate levels to report on and account for their activities. Politics and policy implementation are strictly separated, and it is suggested that professionally trained civil servants loyally implement political decisions. Behavior is controlled and laid down in strict rules and standardized procedures. Critics argue that due to its inflexibility, the focus on procedures instead of output, and the high level of red tape, the bureaucratic administrative model is no longer able to respond adequately to current issues.

The merge of the traditional model with general or generic management is considered to be the appropriate solution to this problem. It refers to management approaches, values, techniques and instruments that are applied by commercial, private sector enterprises and is supposedly about "getting things done as quickly, as cheaply, and as effective as possible." In practice, administrations and public sector organizations implement management techniques such as performance contracts, performance monitoring, and performance-related pay (Hood 1991; Pollitt and Bouckaert 2011) and place a greater emphasis on values such as efficiency, effectiveness, and flexibility. Public management reforms thus "summarize a way of reorganizing public sector bodies, and to bring their management, reporting, and accounting approaches closer to (a particular perception of) business methods" (Dunleavy and Hood 1994, p. 9) and imply a shift from a focus on process to a focus on output, from inflexible hierarchies to flexibility and competition, from preoccupation with structure to preoccupation with improvements of process, from fixed pay to variable pay, and from the stability of government agencies and budgets to market-style competition (Kettl 1997, p. 447). As a result, loyal and controlled civil servants become active, entrepreneurial managers that, rather than following rules and obeying hierarchy, seek for quick and efficient solutions via alternative ways.

As goes for privatization, the exact content, intensity, pace, and form of the implementation of public sector reforms differ per country. In that respect, a distinction can be made between countries that either empower or control public managers. Public management reforms in countries such as Sweden and Australia aim to empower the manager by breaking down restrictions in order to "let the manager manage." Following the assumption that public managers know what to do and that they will not take advantage of their discretionary power, public management reforms intend to create space and to remove existing rules and procedures that provide unnecessary barriers (Kettl 1997, p. 449).

Other countries, such as New Zealand and the United Kingdom, implement reforms in order to "make the managers manage." Given that most government agencies are monopolies and, as such, have little incentives to perform better, reforms are targeted at increasing or improving their performance. In order to do so, market-like incentives such as performance-related pay or the requirements to reach specific targets are introduced (Kettl 1997).

Various studies indicate that the supposed benefits from these reforms are not materialized in practice given the lack of capacity of those that are suggested to act as public managers. They demonstrate that being an efficient and effective public manager is not that easy given that they operate under high political pressure, that they are often supposed to do things they do not have any experience with, and that they must act much quicker while at the same time having less resources to spend (Kettl 1997, p. 454). As such is has been suggested that, in order to fully enjoy the potential benefits of public management reforms, governments should invest in the capacity of public manager to actually act as managers.

As goes for privatization, public management reforms are subject to intense scientific debate too. The debate focuses mainly on the "hollowing out

of the state" and on the appropriateness of a general private sector-based management model for the public sector. With respect to the first, scholars suggest that the dominant neoliberal agenda might contribute to the "hollowing out of the state," implying that politicians are no longer in control when it comes to influencing and constructing public policy (Rhodes 1994). In that respect, it is argued that NPM intentionally separates politics from administration and that it allows managers to manage according to economic rationality rather than in accordance with the political and public opinion. As a result, politicians fear that they lose control over public service management and policy making. The perception of a loss of responsiveness in the context of NPM has grown even stronger because of the importance of external advisors for public policy and public service delivery. In relation to that, Drechsler (2005, p. 98) describes "NPM specifically returns decision making to the allegedly expert bureaucrat, under the cloak of efficiency, therefore removing political control, and that also means political responsibility, from the political sphere."

This debate focuses mainly on the appropriateness of a general private sector-based management model for the public sector. In contrast to the suggestions made by generic management supporters who argue that a universal management approach is applicable independently of the organizations context, critics question to what extent private sector management techniques are compatible with and appropriate for the specific context of public organizations. In that respect, it is suggested that the public sector, public organizations, and public managers are confronted with a different organizational environment and structure and with different goals and managerial values that require management approaches that fit this specific context.

As a result, some consider the incorporation of private sector values and private sector management techniques into the public sector problematic given the assumed differences between public and private organizations in terms of their publicness which can be defined as "a characteristic of an organization which reflects the extent the organization is influenced by political authority" (Bozeman and Bretschneider 1994, p. 197). Various empirical studies have indeed tried to assess to what extent public and private organizations are different and whether the incorporation of private sector management techniques and values indeed is undesirable. It has been concluded that "there is no clear support for the view that public and private management are fundamentally dissimilar" and that convincing proof for rejecting the incorporation of private sector values or management techniques does not (yet) exist (Boyne 2002, pp. 116–118).

Empirical studies on both the appropriateness and benefits of public sector management reforms do not provide a definite verdict given that it appears to be very difficult to establish the exact effect of large and complex reform programs on specific dimensions. Besides, many governments have not implemented credible evaluation procedures that allow for measuring the result of public sector management reforms. Finally, it is argued that the little empirical evidence that is available does not provide convincing evidence given that they mostly concern disaggregated studies (Pollitt and Bouckaert 2011, p. 215).

## Conclusion

Ever since the 1970s, governments undertake attempts to reform the traditional bureaucratic public administration model that is suggested to become too big, costly, inefficient, ineffective, overly bureaucratic, and too little responsive to public needs. The business-like approach to government as suggested by supporters of the NPM aims at increasing private sector involvement through privatization and at optimizing public sector management through the incorporation of private sector values and private sector management techniques. The exact content, intensity, pace, and form of the implementation of public sector reforms differ per country. Although convincing empirical evidence on the contribution of privatization and public management is scarce, the academic, societal, and political debate on NPM reforms are vibrant.

# Privatization and Reforms

Frank L. K. Ohemeng
Department of Political Science, Concordia University, Montreal, QC, Canada

## Synonyms

Amelioration; Betterment; Change; Denationalization; Improvement; Transfer

## Definitions

In a narrower sense, privatization denotes the complete sale of a public service delivery entity to a private sector organization. It is therefore concerned with a government completely divesting itself of delivery of a public service and allowing the private sector to take full control of it.

In a broader sense, it denotes, on one hand, actions to reduce the role of government, and on the other, the use of market forces to produce a more competitive economy. In this sense it may take the form of deregulation, public-private partnerships, trade liberalization, or the increased contracting out of government services.

## Introduction

Privatization has become one of the major policy planks of the administrative reforms that have ensued from the Thatcher and Reagan economic revolutions from the late 1970s to the early 1980s in, respectively, Great Britain and the United States. These revolutions led to what Hood (1991) has described as the New Public Management (NPM). A fundamental premise of the NPM is that the state had become too large and, therefore, inefficient, and no good at doing what it is supposed to do. The private sector, though, continued to show much promise when it comes to delivering services; the state should, therefore, restrict itself to issues relating to protection and

allow the market, or the private sector, to actually do the delivering.

The main thrusts of the NPM include more orientation to results, value for money, serving the client, and strategy and policy development; introducing competition and other market elements; changing relationships with other levels of government; explicit standards and measures of performance; emphasizing private-sector style management practices; and greater discipline and parsimony in resource use (Hood 1991). The defining characteristics of NPM are its entrepreneurial dynamic, its reinstatement of the competitive market as a potentially more proficient provider of public services than the state, and its proclaimed intention to transform managerial behavior (Minogue 2001), and it is these that have pushed privatization to the forefront of reforms.

## Public Sector Reforms

Although not new, public sector reform has received significant attention in both developed and developing countries since the early 1980s. What has been different, compared to reforms before this period was about institutional tinkling. As a result, reforms before the early 1980s focused more on the Civil Service or what most scholars conceived as "administrative reforms." In short, administrative reform was narrowly focused. As a result, reform was for example, defined as:

> a deliberate process to change both the structures and procedures of the public bureaucracy and the attitudes and behaviour of the public bureaucrats involved in order to promote organisational effectiveness and attain national developmental goals. (Quah 1976: 58)

Recent reforms have however changed to look at the larger public sector. Thus, reform in the public sector, according to Olsen (2017), is about comprehensive changes in the political-administrative orders – arrangements of institutions – rather than to incremental modifications in single institutions (9). In this perspective, reforms concerning the public sector deals with radical institutional changes, altering the existing institutional arrangements to new different forms. In some cases, the reform may be about reorganizations of such institutions, while in others, it may be a complete overhauling of such institutions. The most radical part of reforms, however, deals with waning the government off from certain activities, leading in some instances, to the collapsing or getting rid of the public institutions involved, while allowing the private sector to enter and undertake such activities. It is the latter part of reforms, which privatization generally fit.

## Types of Privatization

Despite the rise of privatization in both developed and developing countries, there seems to be no agreement about the content of the idea. As can be seen from the foregoing, as well as the numerous definitions in the literature, it can, in one breath, encompass a whole range of government activities that need to be transferred to the private sector, with government still owning the services, or, simply, government completely removing itself from such a service. This lack of consensus has given rise to a multiplicity of categories or forms of privatization. At least five major forms of privatization can be discerned in the literature. The fundamental idea in all of them is allowing markets, rather than the state, to provide goods and services to consumers.

## Contracting out

Contracting out is a major one among the many forms of privatization. According to Domberger and Jensen (1997), contracting out refers to the "opening up to competition a set of economic activities which were previously immune from it. Organizations are invited to submit bids for contracts to provide particular services to the client" (68). Thus, contracting out involves, simply, the government retaining ownership and overall control of a service, while employing a private

sector operator to undertake the delivery of the service. For example, most municipalities in the developed world have, at some point, contracted out garbage collection and water services delivery (Voorn et al. 2020). The distinctive feature of contracting out in the words of Domberger and Jensen (1997) is the element of ex ante competition – competition for the market as opposed to competition in it (68).

## Divestiture

The pure form of privatization is called divestiture, which means the complete sale of government entities to the private sector. It has been called "the transfer of enterprises from the public to the private sector, be it through a transfer of securities (including shares), businesses or other productive assets. It implies a transfer of property rights from a public body (State, government, ministry, public agency, local government, enterprise owned or controlled by the public sector or any other public body) to a private party, whether against payment (sales)or not (e.g. free distribution of shares)" (Guislain 1992: 1).

Unlike contracting out, in divestiture government rids itself utterly of a state-owned entity and may only regulate the entire sector in which the entity operates: what the literature refers to as the "task environment." It was this that most developing countries, with the aid of the World Bank and the International Monetary Fund, undertook in the 1980s and 1990s to rid themselves of their SOEs (which had become burdens on the states' finances and enlarged the public sector) as part of the Structural Adjustment Program (SAP), the highly indebted poor countries (HIPC), and the good governance initiatives (Doyle 2010; Killick and Commander 1988).

## Management Contract

A third form of privatization is the management contract. Here the government transfers management control over a public entity, usually a state-owned enterprise (SOE), without transferring ownership. The government still owns the public entity but engages a contractor to manage a range of activities for a relatively short time, normally 5 years or less. Management contracts tend to be task specific and input rather than output focused. Operation and maintenance agreements may have more outputs or performance requirements. In management contracts a private entity is paid a fixed fee to perform a specific task that the public authority is supposed to undertake. Unlike contracting out, the private operator does not take on the risk of asset.

## User Fees or Charges

A fourth type of privatization is user fees or charges. User fees are a "service charge" (or "user charge") for certain public services. Thus, it is the "amounts received (by governments) from the public for the performance of specific services benefiting the persons charged" (Boyle 1976: 1). There are two types of user fees paid for public services that are to be distinguished from paying directly for services in the private sector. Users may pay fees at the point of service, which are usually a fraction of the cost of the service. The second type is a generalized user fee often found in the form of premiums paid on top of a program supported by general tax revenues (Antony et al. 2007). User fees are generally seen as a voluntary levy imposed on a person who is benefiting from specific categories of publicly provided service, or as simply a levy on consumers of government goods or services in relation to their consumption (Duff 2004).

## Public-Private Partnership

The term "public-private partnership" is particularly malleable as the name of a kind of privatization. It is defined broadly as an arrangement in which a government and a private entity, for-profit or nonprofit, jointly perform a traditionally public activity. It is defined narrowly as a complex relationship – often involving at least one government unit and a consortium of private firms – created to

build large, capital-intensive, long-lived public infrastructure, such as a highway, airport, public building, or water system, or to undertake a major civic redevelopment project. Private capital and management of the design, construction, and long-term operation of the infrastructure is characteristic of such projects, along with eventual public ownership. Despite its ambiguity, "public-private partnership" is sometimes a useful phrase because it avoids the inflammatory effect of "privatization" on those ideologically opposed (Savas 2000).

## Franchising

Another form of privatization is franchising. Under a franchise government awards a private organization the right (often exclusively) to sell a service or a product to the public, with the organization usually paying the government a fee. In other words, it is a contract between a government and a private entity for the production of a product or service by the latter, who establishes an outlet to produce or sell the product or to deliver a service. In franchising the government will allow a private organization into the public domain, such as the airwaves, air space, streets, or underground space, to carry out their commercial activities (Savas 2000). Franchising is thus used as a means to promote "competition in circumstances where actual competition is either not possible (natural monopoly) or not desirable (wasteful)" (Mackie 1983: 48).

## The Impetus of Privatization

Again, the literature has continued to provide a plethora of reasons for the wave of privatization that has gripped the world since the early 1980s. A look at these reasons, however, helps us to identify three major factors, or at least categories. The first is simply reducing the size of government. Proponents believe that government has grown too big and encroaches on areas in the general economy where the market could function better. This encroachment has created significant debts for government and stifled competition, which could benefit service delivery. To those who hold this belief, privatizing government will shrink its debt, while promoting competition both locally and globally.

The second factor, which is linked to the first, is increasing efficiency. Efficiency means use of resources in such a way as to maximize the production of goods and services. According to Sullivan and Sheffrin (2003: 15), a system is efficient if (a) no one can be made better off without making someone else worse off, (b) more output cannot be obtained without increasing the amount of inputs, and (c) production proceeds at the lowest possible per-unit cost. To proponents of the privatization idea, government cannot meet these conditions; hence, service delivery is unequal, and people who need essential services are worse off, all the while costing government exorbitantly. On the other hand, the private sector continues to show tremendous efficiencies and thus can do a better job of producing or delivering services.

The third factor is effectiveness. Effectiveness is much more concerned about the timing of service delivery but is linked to efficiency inasmuch as such timing may require either fewer or more resources. Various explanatory models of effectiveness have been developed (Njoh 1994); however, with respect to privatization, it seems to refer generally to how organizations use resources to achieve their goals. Thus, it could be said to relate to the timely delivery of services to clients or citizens.

Proponents of privatization believe that the private sector is able to achieve these three factors or variables better than the public sector. Thus, they argue, government must only provide the necessary environment for the private sector to function. If this is done, then many societal problems, especially relating to service production and delivery, can be addressed, and society itself will be better served.

## Privatization and Reforms in Developed and Developing Countries

As already mentioned, an unprecedented wave of privatizations took place in both developed and

developing countries as part of the attempts to reform the state and make it work better. This wave was an expression of the political right's view of the administrative state: it charged it with an array of crimes, such as failure to perform; abuse of power; repression of employees, clients, and people in general; and being muddled, confused, expensive, unresponsive, bloated, and self-destructive to the extent that it is now seen as a "splendid hate object" that must be reformed or, even, destroyed. To these conservatives, the problems faced by the modern state in the late 1960s and early 1970s were the product of the state's expansion of its activities. They claimed that "if government was not the root of all evil, it certainly was more part of the problem than the solution" (Stiglitz 2003: 85). For instance, Barzelay (1992) argued that the existing bureaucratic model (the state), while promising good government, really tended to constrain it and produced weak, misplaced, and misguided accountability (xv). Such criticisms provoked calls from some quarters to tame or, even, banish the administrative state.

A fundamental assumption of the political right was, therefore, a minimalist role for the public sector while enhancing the power of the private sector. It was time, they asserted, to curtail what they saw as the "intrusion of the state into people's private lives"; and where it was not possible to interrupt that trend, to subject the state to some of the rigorous practices of the market, which have led to prosperity and improved performance of the private sector as a whole. In short, they complained about the state engaging in activities that could and should be undertaken by private individuals or groups. Where such activities were beyond the capability of the private sector, it was held, the state should develop mechanisms that would serve the interests of citizens rather than the needs of the bureaucracy. In this way the bureaucracy could be subjected to an accountability regime that would lead to a reduction of its power.

To the proponents of the minimalist state, the idea of curtailing the state and enhancing bureaucratic efficiency could be realized by limiting the state's role in service delivery and by managing government like a private business, through privatization and the introduction of market efficiencies and tools of private sector management into residual state functions. Privatization, therefore, is fundamental to that agenda and has gained much currency in current administrative reform discourse.

Adhering to this agenda led governments to privatize many public services. For example, in Great Britain under the rule of Margaret Thatcher, the government privatized a number of hitherto state enterprises, such as the National Rail, the water system (Helm 2020), the National Telecommunication, airports, and a host of others. In Canada, beginning with the Mulroney government, a number of Federal Crown Corporations became victims of privatization. In the Province of Ontario in Canada, under the Conservative government that held power from late 1995 until its defeat in 2003, privatized government organizations and activities included water testing, which had been performed by the Ministry of the Environment (Ohemeng and Grant 2008). The tsunami of privatization that hit Southeast Asia in late 2004 included New Zealand, with the sale of a significant number of government owned enterprises and other activities (Schick 1998). In the United States contracting out, franchising, leasing, and other forms of privatization became the hallmark of public sector reforms.

In developing countries privatizations as a policy of reform, as already noted, were undertaken under the auspices of the World Bank – and IMF – backed SAP in the 1980s and HIPC and good governance initiatives in the 1990s (Doyle 2010). For these countries, the core ideas of the SAP and the programs engineered by these institutions dealt with the pursuit of macroeconomic stability by controlling inflation, reducing fiscal deficits, opening developing countries' economies to the rest of the world through trade and capital account liberalization, liberalizing domestic product and factor markets through privatization and deregulations, and reforming the state, which they believed was "swollen" and suffering from "bureaucratic elephantiasis syndrome" (Goldsmith 1999). As a result of these programs and initiatives, many of these countries privatized numerous state-owned enterprises, which were considered moribund, through divestiture (Conteh and Ohemeng 2009).

Despite the sale of these public organizations, many still considered the process too slow: a belief that continues to compel them. Now, rather than focusing on moribund institutions, their attention has shifted to core state enterprises in the utility sector and, to some extent, to social security. Meanwhile market principles have been introduced even into the health sectors in these countries.

## Debating Privatization as a Tool for Reform

Belief in privatization's power to reduce the state and enhance service delivery continues, but there is currently no consensus about the form it should take (Helm 2020). Proponents continue to advocate for more, while opponents persist in exposing its weaknesses in a number of areas. While outright sale of public organizations has had limited success, the former still promote the idea of public-private partnership, contracting out, and other forms. A number of studies continue to show that these hybrid types of privatization do work and that government should continue to vigorously explore them. They emphasize areas like telecommunications, which has been hugely improved by competition in both developed and developing countries, as examples.

On the other hand, there is now a vast literature pointing out the failures of privatization in these countries, leading to de-privatization or privatization reversals, or back to the state or in-house service production and delivery. One particular area that has seen significant failures, and therefore, privatization reversal, is water (Helm 2020; Voorn et al. 2020). This sector was touted as the "next big thing" after crude oil. Unfortunately, even France, the supposed exemplar of water privatization, has now taken water back to in-house (Voorn et al. 2020).

## Conclusion

Privatization as a reform tool continues to be hotly debated. While supporters view it as instrumental in correcting the state, dissenters continue to point out its defects. For many of the former, a variety of manifestations of privatization help the state deliver better service and ensure what they call the three "Es": efficiency, effectiveness, and economy. While many of them see divestiture as not the ideal way to privatize, they do approve of contracting out, public-private partnership, as a way for the state to undertake meaningful development and achieve socioeconomic well-being. Critics continue, however, to dismiss this argument and dismiss privatization as a fantasy, emphasizing its failures in every form, wherever it is attempted. It is therefore difficult for anyone to identify how, exactly, privatization can be called a promising way to reform the state.

# Privatization in Central Government

Patricia Bachiller
University of Zaragoza, Zaragoza, Spain

## Synonyms

Corporatization; Denationalization

## Definition

The transfer of ownership of a state-owned company from a government (public sector) to a privately owned entity or private investors (private sector).

## Introduction

The privatization of state-owned enterprises (SOEs) has become a common process all over the world and is considered a major component of the New Public Management (NPM). The sale of SOEs and their assets to private parties by the governments has been one of the most relevant issues in the reforms of the public sector, and privatizations are expected to correct inefficiencies associated with the public sector. Moreover, the requirement of the European Union of governmental neutrality, the globalization of markets, and changes in organizational and productive processes have led to the decrease of the intervention of governments in the economy.

Privatization has not only reduced the role of the State in the production of goods and services, but has also increased the size and efficiency of the capital markets and the participation of citizens in stock markets. In line with this, newly privatized firms have begun to operate in an environment of greater economic freedom and, therefore, have initiated an expansion to take advantage of the market and of the financial opportunities. For an effective transformation, organizational changes must be undertaken by these entities to guarantee their continuance in the market, and their goals must be modified as a consequence of a greater market orientation and environmental changes. There is a lot of divergence between public and private companies and, consequently, SOEs have undertaken internal changes to carry out an effective restructuring and to adapt to the new competitive environment.

## Reasons and Factors for Privatization

Reasons that boost this process are the changing view of the role of the State in the economy, new

perceptions about the control and distributional function of utilities, the growing demand for more and better quality infrastructure services, and technological developments in the telecommunications and electricity industries. Governments have given multiple reasons for carrying out the privatization process, including the increase of revenues for the State (Brusca et al. 2015), to promote economic efficiency, to reduce the interference of the Administration in the economy, and to introduce competition and to discipline SOEs through capital markets.

The reasons for privatization can be categorized as economic, financial, and political (Vickers and Yarrow 1991). Efficiency is the economic reason most frequently used by governments to justify privatization programs. In privatization processes, most governments assert that private companies are better managed and are more efficient than public ones, and economic theory admits that private ownership transforms SOEs into more efficient firms, especially in competitive industries (Megginson et al. 1994). However, there is no theoretical consensus about the capacity of private ownership to pursue social objectives such as the stabilization of employment or the provision of goods and services at reasonable quality for citizens. Currently, controversy continues about whether SOEs should maximize profits or have only social objectives. Theoreticians do not agree on whether a state monopoly is preferable or whether the monopoly must be private and subject to regulation.

Privatization has changed the perspective from which regulatory questions are addressed, as market failures associated with monopoly and externalities do not disappear with a change of ownership. Development of a modern regulatory system is neither simple nor fast. The problem is vast, and sustainable change requires not only reforms to thousands of instruments, but also new institutional capacities and a shift by the public administration from a culture of control and rent-seeking to a culture of results-orientation and client services. Therefore, countries face the task of moving forward with the transition to market-led growth to maintain economic performance in response to technological innovations, changes in consumer demand, and interdependencies in regional and global markets. In this transition, supply-side reforms to stimulate competition and reduce regulatory inefficiencies have become central to effective economic policy.

## The Process of Privatization

Governments employ three basic techniques to privatize their SOEs – share issue privatizations, asset sales, and voucher privatizations – according to the objectives of the privatization process.

The decision about the transfer method of SOEs is not straightforward. Political factors like the ideology of the government about the market and regulation and economic factors like the financial position of SOEs and the conditions of capital markets are involved in the privatization process. Governments use the sale of an SOE as a tool to develop a capital market. Larger and more profitable SOEs are more likely to be privatized through capital markets, while governments that have less state control over the economy tend to privatize SOEs via asset sales.

In a privatization process, the method of privatization determines the management replacement, because it determines who the new owners are. In initial public offers (IPO), the company is usually restructured previously in order to prepare it for private ownership and to reach higher value in capital markets. Moreover, in privatizations by IPO, managers are exposed to the discipline of financial markets and the control of investors, and public companies are no longer immune to acquisition and to the threat of bankruptcy. The preparation for an IPO, and the IPO itself, causes organizational changes within a company that contribute to performance. The most relevant IPO-related changes that contribute to performance are related to innovation, financial management, and financial reporting (planning and control, capital budgeting, and internal communication).

In the environment of the post-communist transition of the Eastern European countries, privatization is a complex economic and political process. In these countries, voucher privatization has been the main method of sale by giving preferential treatment to citizens and workers of the

privatized enterprises. Restructuring the company and substituting the management may lead to a successful privatization process; however, the literature shows that management has not been replaced in these countries. So, unless voucher privatization is coupled with the possible purchase of shares by foreign firms, the newly privatized state enterprises have difficulty making the restructuring with the existing management and face additional costs in purchasing managerial skills on the labor market because of adverse selection problem. Literature corroborates this idea in their analysis of companies privatized through voucher privatization as, with voucher privatization, financing and control mechanisms are unlikely to be introduced by external shareholders, so it is more complicated to improve the performance of companies privatized in this way.

## Capital Markets as Disciplinary Mechanisms of Management

Privatization subjects managers to the pressure of the financial markets and monitors and disciplines profit-oriented investors. Therefore, objectives imposed by politicians in SOEs are redefined, and mechanisms that aligned managers' incentives with owners' financial interests are introduced. The accountability to shareholders gives a better incentive for state companies to operate efficiently. That is, the change of ownership has led to new incentive systems to enhance financial performance. Moreover, companies introduced instruments for performance measurement in order to enhance transparency and improve organizational learning. These changes in privatized companies give managers the possibility of increasing their salaries according to their level of efficiency. The change of ownership has generated more defined objectives and new incentive mechanisms for the managers.

SOEs may be less efficient because they are immune to capital markets. The public trading of shares of privatized companies in capital markets will increase their efficiency if privatization is linked to the possibility of takeover by outsiders, disciplines managers, and provides the ability to link compensation to performance. As a result, when shares are traded in public equity markets, managerial effort and accountability increase.

In the companies, agency problems arise between the managers (agents) and owners (principal). In private companies, these problems are reduced through the existence of a market for ownership rights, which enables the owners to sell shares if they are not satisfied with managerial performance (property rights theory), through the threat of takeover and bankruptcy, and through a managerial labor market. In the case of privatized firms, the possibility of issuing capital implies that the discipline of the financial creditor is replaced by the discipline of shareholders and, therefore, of the capital markets.

On occasions, the appointment of SOE managers is carried out according to their capacity of negotiation with politicians, their ideology, and the confidence of politicians in these managers. With the change of ownership, the labor market puts pressure on managers and disciplines them. If the management labor market is competitive, it will be a monitor mechanism and replace non-efficient managers. The conflicts between shareholders and managers are addressed using optimal contracts within a principal-agent framework.

In the privatization process, the capital markets work as a mechanism to establish management incentives. In efficient markets, the stock price incorporates performance information about future benefits from company's decisions (Vickers and Yarrow 1991). This information is useful for shareholder-manager contracts and for defining managerial remuneration. The objectives of compensation plans are to help the company attract, retain, and motivate its executives and other employees. Privatized firms that have incentive systems show more performance improvements than companies that do not have them. Compensation plans motivate employees by providing a direct link between company performance and executive wealth, that is, employees are rewarded for achieving specific goals. These

plans are an efficient mechanism in matching managerial pay to managerial ability.

The public trading of shares establishes the possibility of takeover by outsiders, and the threat of a takeover is another management control mechanism. These market operations may stimulate managers to achieve greater efficiency and to avoid being acquired by another company. A major consequence of privatization is that privatized companies can be targets of takeovers and mergers. Several takeovers in Europe involved newly privatized firms.

From these explanations, it can be observed that the level of development of capital markets is a key determinant of post-privatization efficiency gains. More developed markets facilitate access to private debt and equity, which allows a more far-reaching modernization and restructuring of companies. Companies whose shares are traded in more sophisticated and active markets can obtain greater performance improvements from the privatization process.

## The Governance System in the Privatization Process

The privatization of SOEs has been one of the most important channels for improving corporate governance, which is a key element for enhancing economic efficiency and investor confidence. Good corporate governance should provide proper incentives for the board and management to pursue objectives that are in line with the interests of the company and of shareholders and should create trust in order to promote an efficient and transparent market economy. The change of the ownership structure has required modifications in the mechanisms of corporate governance of privatized companies. In these companies, governance depends on the effectiveness of relations between interest groups that control the strategic management and the performance of the company.

Figure 1 shows factors and mechanism of corporate governance. As it can be seen, the

**Privatization in Central Government, Fig. 1** Factors and mechanisms of corporate governance systems. (Source: self-elaborated, based on La Porta et al. (2000))

separation of owners and managers and the expansion of capital markets, derived from the increase of quoted firms, boost the development of corporate governance. Corporate governance has to do with the agency problem: the separation of management and ownership. The fundamental question of corporate governance is how to assure investors that they get a return on their financial investment.

With globalization, institutional investors force companies to comply with the rules of transparency and corporate governance, as institutional investors acquire shares of companies to maintain shares in the long run (Megginson 2005). This author states that creating a satisfactory corporate governance system generally involves changing a nation's corporate and securities laws, strengthening the listing and disclosure requirements for its stock exchanges, enhancing the independence and competence of the national judiciary, and establishing a regulatory regime capable of balancing the competing claims of managers, outside shareholders, and creditors.

Factors of corporate governance can be split into two groups: internal and external mechanisms. Internal governance mechanisms include ownership concentration, board composition, executive compensation, top management replacement, the monitoring of executive decisions, and the protection of outside investors. External governance mechanisms refer to the effectiveness of a market for corporate control that may permit the purchase of the firm when it is underperforming. Both types of mechanisms are influenced by environmental and organizational factors linked to the privatization process.

Finally, other corporate governance mechanisms are the legal system and codes of good governance. The country's legal system must force managers to feel the discipline of the capital market. Markets affording greater shareholder protection are consistently larger and more efficient. Codes of good governance are a set of best practice recommendations about the structure of the boards of directors and act as a substitute for deficiencies in the protection of shareholders in the legal system.

In the privatization context, all these mechanisms are very important, and the government should prevent the newly created shareholders from being expropriated by the managers of privatized companies. Where the law affords weak protection to shareholders, governments are more reluctant to relinquish control of SOEs to avoid opportunist behavior on the part of privatized firms, and privatization efficiency is lower.

The property rights theory states that privatization must replace political managers to create an independent governance system in the companies. Furthermore, privatization to outsiders is associated with higher gains than privatization to insiders. That is, new owners will restructure the company to recover their investment and obtain a higher profitability.

Governments must enhance corporate governance systems to promote transparent markets and a successful privatization process. Investors decide to acquire shares and restructure the company in order to adapt it to the new competitive environment. Weak governance and a limited protection of minority shareholders intensify traditional principal-agent problems. These problems have relationship with issues of managerial discretion and expropriation, which occurs when large owners assume control of the firm and deprive minority owners of the right to appropriate returns on their investments. Post-privatization performance improves when corporate structures are introduced into the companies.

## Results of the Privatization Process

Main conclusions that can be extracted from privatization process are:

1. The privatization process has reduced the role of the SOEs in the economy in order to fulfill economic, political, and financial objectives imposed by the governments.

   The Depression and World War II pushed the government into a more active role in their economies, including the ownership of the production of goods and services. In the second half of the twentieth century, Western European governments debated how deeply involved the national

government should be in regulating the national economy and which industrial sectors should be reserved exclusively for state ownership. They decided that the government should own at least the telecommunications and postal services, electric and gas utilities, and transportation. Many politicians also believed that the state should control strategic manufacturing industries such as steel and defense production. Another reason to boost state ownership was the general resentment toward foreign investors owning the largest firms, so privatization policies provided a preferential treatment to national investors in their early stages.

With the Thatcher government, privatization programs started in the UK, and the change of ownership of British Telecom in 1984 meant the beginning of privatization as an essential economic policy in the country (Martin and Parker 1995). The successful British privatization program persuaded other countries to sell their SOEs. The objectives established by governments through privatization processes define initial conditions of the sale of SOEs. All governments must take three decisions about privatization: how to transfer control of the company, what price to offer, and how to distribute the shares. A government that does not want to interfere with the privatized firms will distribute their sale over time to gain credibility. Firms whose value is highly sensitive to public policy choices will be privatized with smaller share sales to retain their control for long.

The ideology of left-wing governments is more inclined to privatize SOEs to foreign investors than right-wing governments, rather than decrease the sale price in order to carry out redistribution between domestic investors. Left-wing governments adopt strategies for obtaining more revenues. A market-oriented government will significantly decrease the price in the initial offer of privatization to signal to investors that it will not interfere with the privatized firm in the future. Most initial sales have political features such as preferential share allocations to domestic investors and employees.

2. Privatization – an appropriate regulation and the liberalization of the market can lead to efficiency improvements.

The agency theory predicts that change of ownership per se will lead to improvements in the performance of privatized company. This theory analyzes the differences between the performance of private firms and SOEs as a result of the differences in the principal-agent relationship. In the private company, divergences between shareholders and managers are managed through internal and external control mechanisms, but SOEs do not have these mechanisms as they do not operate in a competitive market. In SOEs, the principal's objectives are related to the public interest whereas, in private firms, the principal's objectives are related to maximizing the firm's value. Furthermore, the manager (agent) of an SOE has two principals, voters and government, whereas, in private companies, the principal is the shareholders. Additionally, the public choice theory defends that the State is a self-interested agent that pursues its own interest and, consequently, SOEs have multiple and varied objectives. These theories are confirmed by literature (Boycko et al. 1996) and highlights problems in the SOEs using a model that shows the gap between the objectives of politicians and managers.

Although both theories defend that privatization improves the performance of companies, many studies do not agree with this assertion. There is considerable debate about whether the efficiency and productivity of an SOE depend more on regulation and competition in the market or on ownership (Yarrow 1986; Vickers and Yarrow 1991).

According to Vickers and Yarrow (1991), competition is one of the main components of improvements in the performance of privatized companies. Liberalization, more than privatization, forces public companies to be more efficient. Empirical studies like Megginson et al. (1994) assert that there are significant differences between the performance of companies that operate in competitive and non-competitive markets. In these studies, it can

be observed that all companies improve their performance after being privatized; but if the market is competitive, the benefit will be higher.

Currently, the regulatory decisions have been designed to introduce rules that do not interfere in the running of competitive markets, and regulatory powers are more widely distributed at the national, regional, and international levels.

3. Privatization processes have contributed to the development of capital markets

One of the objectives of privatization has been to promote the so-called popular capitalism, that is, the democratization of capital markets through the participation of citizens in privatization processes. Privatizations by initial public offering (IPO) have developed primitive capital markets, and the sale of shares of SOEs tends to be underpriced to attract the participation of investors. Companies privatized by IPO generally obtain higher market capitalization and values in the capital markets.

Quoted companies generate an economic benefit from the increase in efficiency and liquidity that they provoke in the capital markets. The efficiency of capital markets promotes economic growth and allows the financing of investment opportunities of companies, not only in capital markets, but also in bond markets. So, the privatization of SOEs promotes the development of fixed income markets.

In privatization processes by IPO, investors purchase shares and resell them to earn significant positive returns. One reason is that IPOs may be significantly underpriced. In the long run, important gains are generated, which indicates that the market underestimates the total efficiency gains due to privatization. Parker (1997) analyzes the privatized sector in the UK and asserts that gains for investors are due to the high profits of privatized companies and the low level of competition in the first years after privatization, which lead to high returns to investors. Investors have gained experience about important variables such as the cost of capital, asset values, and depreciation rates of regulated firms, so they can evaluate the real price and the market price and avoid underpricing.

4. The privatization process modernizes a nation's corporate governance system.

The change of ownership aims to increase corporate efficiency and transform corporate governance by introducing incentives systems in companies and creating arrangements that are conducive to effective governance.

The adoption of privatization programs strengthens a nation's governance systems and leads to significant improvements in the market regulation and financial systems. So privatization programs have forced governments to improve effective governance systems so that the change of ownership of SOEs is perceived as economic and political success. This is more complex than the simple fact of selling SOEs because it implies that many rules and institutions have to change simultaneously. Concern about the security issues of capital markets has risen with the privatization process, and the law has tried to strengthen the defense of minority shareholders. Another consequence of a successful privatization process is the change of the legal system in order to protect investors.

In recent years, governments have boosted privatization by public offer and have established a regulation to increase the confidence of potential investors and guarantee that the capital markets are appropriate for investing in these companies. This has led capital markets to be more liquid and transparent.

From these results, it can be observed that the privatization process has meant rapid changes in utilities and infrastructure companies. Global competition between multinational firms has replaced domestic and monopolistic markets by others that are more segmented and competitive. In spite of these gains derived from privatization, the relationship between these benefits and the change of ownership is not clear. The results of privatization take several years more than expected to appear. Privatized industries have grown and become more profitable, but the causality

relationship runs from the growth and profitability to the privatization, not in the opposite direction. The benefits of privatization coincide with increasing dissatisfaction among and opposition from citizens. Macroeconomic and distributional gains are not equivalent to microeconomic gains, and in several cases the privatization process has not been transparent. Figure 2 shows factors that boost the privatization process and its main results. However, it is also necessary to consider that key elements such as regulation, competition, restructuring of privatized companies, and changes in corporate governance systems influence post-privatization performance.

## Conclusions

The above theories and perspectives on privatization offer positive features, but they also carry serious problems of their own. For example, change of ownership is not enough to improve efficiency in privatized companies, which indicates that compliance with fiscal rules and the development of the capital markets may be the real reasons why the governments implemented the privatization process.

Capital markets discipline privatized companies because of the threat of takeover – when the company is not efficient enough – and the risk of bankruptcy. This is a consequence of the lack of financial support from the government, which no longer subsidizes privatized companies nor takes responsibility for their debts. Literature corroborates this idea and shows that companies privatized through public offers obtain a better performance in the short run than companies privatized through private sale or voucher privatization. SOE managers have freedom to take decisions, and they are only accountable to politicians. However, the change of ownership means that managers have to justify their actions to new private shareholders and are exposed to the risk of being replaced by more efficient managers. If the corporate governance system of a country is weak, investors' rights are not protected, and there is no confidence in the financial system. This can explain why insiders, old employees and directors, rather than outsiders have acquired the control of the privatized companies. The lack of outsider control means that privatized companies' performance does not improve with privatization.

Privatized companies have introduced management techniques and have carried out internal restructurings, modifying their objectives and

**Privatization in Central Government,**
**Fig. 2** Casual factors and results of privatization processes. (Source: Self-elaborated)

strategies. Restructurings allow them to give a better economic image, and, consequently, governments can obtain higher revenues and reduce the public deficit with the share sales. Moreover, more investors are attracted to the capital markets, which promote the so-called popular capitalism. The internal changes require a learning process and a period of adjustment because companies do not receive financial support from governments and they need several years to adapt to the new competitive environment.

The conclusions presented here allow to assert that the results of privatization have not always been those expected because the companies have not improved their efficiency with the change of ownership. This indicates that governments have followed other aims, such as modernization of the corporate governance system or the development of the capital markets. Privatization is a necessary response to globalization and the liberalization of markets but not an independent trend.

# Privatization in Local Governments

Francisco Bastida
University of Murcia/American University of Armenia, Murcia, Spain
Facultad de Economía y Empresa, Murcia, Spain

## Synonyms

Denationalization

## Definition

The process by which a company or organization is transferred from the local government to the private sector (private company) so that the latter will hold ownership and control thereafter.

## Introduction

The term "privatization" sometimes is ambiguous. There are several ways in which the private sector manages municipal services: concessions, delegated management contracts, leasing, or other forms of public–private partnership. However, these management agreements are normally not considered as privatization. The term privatization refers to a transfer of assets to the private sector rather than just a transfer of activities. This distinction is necessary because an increasing share of privatizations takes place in public utilities and infrastructure, sectors which also have a high proportion of public–private partnerships that in some aspects may be close substitutes to asset sell-offs (OECD 2009). Figure 1 shows the continuum that exists between the two opposite ways to provide a public service, i.e., from in-house

**Privatization in Local Governments, Fig. 1** From in-house delivery of municipal public services to privatization. (Source: Cruz et al. (2013))

(100% government provision) to a privatized way (private company delivery).

We can set the early nineteenth century as the moment when public services in general started to be provided by local governments. These basic services formed the incipient local welfare state. Since this time, the scope of municipal public services has spread at different paces in all developed countries. However, at the end of the twentieth century, a neoliberal policy named the "new public management" (NPM) theory proposed a market liberalization policy, which included the privatization of municipal services. This theory predicted significant improvements stemming from privatization: greater efficiency and quality of remaining government activities, lower taxes, and smaller government size. In the services that are privatized, the profit-seeking approach of private companies will lead to cost cutting and greater customer satisfaction.

In addition to this privatization process, there has been a contradictory trend in recent years in Europe, since increasing public services have been devoted to local governments, while at the same time budget restrictions have significantly limited local governments' ability to provide services. In an attempt to reduce the political impact, municipal incumbents have considered privatization, as opposed to direct public provision, as a way to provide services without increasing service-connected taxes, thus reducing the service-specific deficit.

Apart from NPM and fiscal stress, other factors led to privatization of local government services in Europe. First, the emergence of populist political movements that were critiques of bureaucracy and waste in government. Second, the growth of public choice ideas in academia that gradually affected the think tanks and then the views of politicians, particularly conservative politicians. Third, the wave of private sector reforms in the 1980s that led to structural change in many large financial corporations. These changes were exported to the public sector by consultants that had both private and sector practices (John 2001).

Supporters of privatization claim that private market companies can more efficiently deliver many goods or service than government due to free market competition. They argue that this will lead to lower prices, improved quality, a decrease in excessive regulation, and less corruption. Most authors think that not everything should be privatized, due to shortcomings such as market failures and natural monopolies. However, if we move to the extreme line of thought, some think that everything should be privatized, including the local government itself.

## Factors that Influence the Decision to Privatize Local Government Services

Some studies claim that conservative local governments privatize more due to ideological underpinnings. Conservative local governments prefer small governments and believe in the higher efficiency of market competition, while progressive local governments are reluctant to let the private sector provide public services. Conservative politicians that privatize public services may gain political support from local companies located in the municipality. According to this, conservative local governments may get electoral support from privatization, while progressive local

governments may face disappointment from their voters. Privatization is thought to provide cost savings to taxpayers. However, these cost savings depend on many factors, and sometimes it is difficult to create and benefit from competition among service providers (Sundell and Lapuente 2012). Sometimes, privatization of local government services is hampered because European local governments are afraid of losing political support of public employee unions. Actually, some surveys claim that a high degree of unionization of public employees makes privatization more difficult. Coalition governments are also thought to be preventing local governments from privatizing, due to the necessary agreement among parties with different ideologies. The greater the number of coalition members, the higher the probability that at least one party will veto the privatization. Therefore, conservative, majority local governments are the most likely to adopt privatization policies (Sundell and Lapuente 2012). We must keep in mind that the local government will still be held responsible for the cost and quality of the service that has been privatized.

## Advantages of Privatization in Local Governments

These are the advantages claimed to support the privatization of local government services:

- Municipally owned companies tend to suffer from political interference or populist factors. For example, obliging the municipally owned company to purchase supplies from local manufacturers (even when they are more expensive than buying from other suppliers), forcing an industry to freeze its prices/fares to satisfy the electorate or control inflation, or increasing its staffing to reduce unemployment. Privatization is thought to prevent all these negative factors.
- Quality of privatized services is ensured because service provision is periodically reviewed to verify the level of quality.
- By privatizing a municipal nonprofitable company, the local government eliminates the need to provide tax-funded resources to cover losses.
- Contracts are competitively bid to maximize taxpayers' savings.
- Private, for-profit services should not have lower quality than publicly provided services.
- Privatized services benefit from technological innovations developed by the private sector. Private companies may invest retained earnings on research.
- Economies of scale. Small local governments face high unit costs if they operate their own services, because they cannot achieve economies of scale. These municipalities may benefit from privatizing services to companies that work with several municipalities and thus get economies of scale.
- Continuous performance controls and accountability are implemented by the local government.
- Lower capital investment required from the local government. Private companies may use retained earnings to purchase new capital equipment that lowers unit production costs.
- Flexibility in service provision by private sector. Private companies have more flexibility than governments to use part-timers to meet peak periods of activity, to fire unsatisfactory workers, and to allocate workers across a variety of tasks.
- Lower cost for hiring civil servants.
- The local government frees human resources that can be devoted to key areas that need additional staff.
- Savings can be invested in other key municipal areas.
- In cities with growing population, it can be difficult for local governments to meet the increasing demand for public services. Through privatization, companies may respond fast to this increasing demand.
- Should natural monopolies exist, local governments should apply antitrust legislation and/or create institutions to deal with anticompetitive behavior of companies delivering privatized services.

## Disadvantages of Privatization in Local Governments

These are the disadvantages raised by those who are against the privatization of local government services:

- Job loss for government employees. Sometimes, when privatizing a service, the contract obliges the company that wins the bidding to hire the public employees who were providing the service previously. Besides, local governments sometimes reallocate public employees to other government departments or negotiate with them early retirement incentives.
- Problems in the bidding process. Potential suppliers may initially offer a pretty low price to the government, less than actual production costs, to get the privatized service. Subsequently, the company would request a higher price after the government has dismantled its own production system. Such "lowballing" may be reduced if the local government requires long-term contracts or if it sets contracts that allow the local government to grant the privatized service to another company should this "lowballing" occurs.
- Privatization of key local government services makes them lose control over essential public services.
- Cost of managing contracts including quality check and audit of performance. Local governments need to take several important precautions before privatization, in order to avoid legal liability. These precautions include detailed performance specifications for service providers, guidelines for the evaluation of competitive bids, and labor relations precautions. Some ways to monitor the privatized service are continuous cost comparisons, performance appraisals, complaint sheets from customers, citizen satisfaction surveys, periodic reports from contractors, and field observations.
- Potential for favoritism or bias in contract decisions, incentives for corruption. Benefits of cost savings because several companies compete to get the contract sometimes are damped down when it is difficult to create competitive bidding.
- Sometimes it is complicated to perfectly specify which activities privatization will include.
- Clear definition of the problems privatization is expected to solve may be difficult.
- Setting the parameters and indicators that will rule the privatization contract.
- Privatization decision may have overestimated the benefits of privatization and underestimated its costs.
- Real competition must be encouraged. Competitive environment is claimed as one of the factors to support privatization. Private companies have a strong incentive to operate efficiently, while this incentive is missing under public ownership. If private firms consume more inputs to provide the same output, competition will lead to lower margins, lost customers, and decreased profits. However, this effect of competition does not occur in the public sector. Therefore privatization produces the public benefits of lower costs and high quality only if a competitive environment exists, and accordingly, privatization cannot be expected to produce these same benefits in the absence of competition. Considering this fact, municipal governments must make sure that the bidding process follows ethical standards.
- In many instances, privatization has triggered corruption, especially in municipalities from developing countries.
- Privatizing a municipal nonprofitable company may oblige the company to raise prices in order to become profitable.

## Experiences of Privatization in Local Governments

British local governments are, within Europe, those who have applied NPM, and thus, privatization, to the highest extent. In fact, the UK has been exceptional in this privatization process, triggered by the conservative governments during the 1980s and 1990s, the weakness of the state in the UK, and the influence of ideas from the USA.

One great organizational change was the "compulsory competitive tendering" legislation, which obliged local governments to have local services delivered through competitive tendering. The idea was to split the provision of public services in two parts: purchasing function exercised by the local government and the provider function, made by private sector companies. Although this legislation has been already repealed, it changed the way local governments provided services in the UK (John 2001).

In the Netherlands, starting from the 1980s, ideas such as businesslike efficiency, privatization, and corporate-style government were introduced in the municipal sector. Dutch municipalities adopted business practices and implemented privatization. There were some clear examples of privatization, such as the municipality of Tilburg (John 2001). This city sought to become more transparent and more efficient and decided to set up a holding with a concern staff and a number of independently operating subsidiaries (public services). Several services, such as gas, electricity, and the slaughterhouse, were privatized. This process led to the "Tilburg model" that was mimicked by other municipalities in several countries. The main points of this model are:

- Focusing on outputs rather than on inputs: quality-oriented and citizen-friendly management
- Integral cost accountability
- Open and transparent processes
- Decentralization of authority

German local authorities reacted more slowly to NPM ideas. In the 1980s there was resistance to the privatization ideas, which German local governments associated with conservative trends from the USA and the UK. These ideas appeared to undermine the rule of law principle that governs German municipal sector, which means that municipal services are completely regulated by law. Reforms leading to privatization started in the 1990s, changing the German municipal bureaucracy, partly affected by reunification and fiscal stress. Some cities such as Cologne and Hanover introduced new policies first. After these first years of early adoption of privatization, German local governments started to foster the privatization process, for example, the municipal water service, telecommunications, and waste management. An interesting case is the city of Potsdam, which privatized its water supply and sewage disposal services through a globally operating investor. Just 2 years later, Potsdam re-municipalized these services that had been privatized. Actually, in Germany there has been a growing number of binding local referenda in which privatization of municipal services has been rejected by the local citizens.

Similarly, in Switzerland, municipalities, such as Bern, have introduced NPM philosophy. A number of other cities, such as Lucerne, Zurich, and Winterthur, have adopted a similar set of reforms (John 2001).

Nordic countries have been reluctant to full privatization. Sweden, Norway, Denmark, and Finland took NPM ideas slowly. As far as corruption is concerned, we said above that corruption sometimes is connected to privatization. However, we must point out that privatizations in the Nordic countries have not led to greater corruption, since these countries rank in the first positions in all the lists of comparative international corruption.

Swedish municipalities adopted a business model in a way to reform their bureaucracies. Local governments introduced management by objectives and UK-inspired purchaser–provider process. In many cities, such as Stockholm, the privatization process was driven by financial stress, since the local government sought budget savings. In Sweden, to ensure that privatized services are efficient, courts can prevent local governments from making decisions that may jeopardize competition, unless they are justified by public interest.

In the 1970s, many Norwegian municipalities adapted to the philosophy of corporate management. However, privatization has not been adopted to a high extent. In Denmark there have been some reforms aimed at rationalizing bureaucracy, under the influence of conservative governments of the 1980s, which sought to simplify

regulation and introduce market style on public services. Besides, there was a transforming trend to privatize public organizations into private sector companies. However, Danish local authorities have not implemented NPM reforms that much. There have been some initiatives at the local level, and local authorities have focused on total quality management, decentralization, and enhancing the influence of users on public service provision (John 2001).

Finland has reformed its municipal sector to promote results-orientated management and the use of market mechanisms (privatization). Simultaneously, the central government does not monitor local governments because of the constitutional principle of local self-government. Some municipalities have developed standards of service quality (John 2001). As regards municipal production in Finland, municipal reforms in progress are increasingly exploiting markets and competition, as a way to provide welfare services more efficiently.

In France, the local sector has not applied privatization as extensively as in the UK. However, there have been reforms in the provision of local government services, such as water. Due to decentralization reforms and the lower involvement of the central government in municipal issues, local governments sought partners in the private sector. During the 1980s and 1990s, there was a continuous privatization of local government services. Private sector ideas and practices (NPM) have influenced the public sector. France's powerful system of public law principles is against the NPM assumptions of efficiency and flexibility (John 2001).

Like France, Spain has a tradition of private sector provision by companies founded in the late part of the nineteenth century. Since 1975, when the transition to democracy started, Spain privatized many local services, such as water, public transport, waste collection, and street cleaning. Such reforms have also taken place in Portugal, where municipalities have privatized their water supply and waste management services. As in France, NPM reforms in Spain have been rejected by the traditional municipal bureaucracy, the strong legal regulations of municipal services, and the principle of "rule of law." These thorough regulations reduce local governments' flexibility to implement NPM reforms such as privatization. Accordingly, Spain is one of the European countries where privatization of local government services has been more limited (John 2001). However, some municipal services such as water provision, garbage collection, and street cleaning are widely privatized in Spain. In fact, the lack of economic sustainability has always been an important issue for the particular case of waste services in Spain. In an attempt to reduce the political repercussions, local decision-makers might view new governance models (such as privatization) as a chance to raise tariffs without much public opposition. Indeed, referring to the Spanish waste sector, Bel and Miralles (2010) find that "policy makers may have used privatization as a means of reducing the political cost of increasing service-specific taxes, thus reducing the service-specific deficit."

Italy's local government privatization differs from France and Spain, since there is less experience of municipal services privately provided. Many functions were provided in-house, such as cultural and social services; others, such as water, refuse collection, and disposal and transport, were provided by semiprivate entities' communal agencies. Moreover, the move to more flexible forms of service delivery has been much slower than local governments of other countries. Italian political parties had no ideological commitment to privatization. Since that time, the growth of the importance of business people in Italian politics has meant more public commitment to business practices. Strong mayors have pursued privatization policies. In Trieste, for example, privatization has been advanced with the selling off of land and contracting out of municipal services (John 2001). For example, Rome is working toward the privatization of the municipal waste company, but there is opposition from the citizens.

## Re-municipalization of Municipal Services

There are empirical indications that in recent years, a comeback of public/municipal sector-

based provision of public services has been gaining momentum and that a pendulum swing toward a "re-municipalization" is under way (Wollmann and Marcou 2010). The reasons for re-municipalization are diverse, but they stem mainly from the failures of water privatization. If a government-owned company providing an essential service (such as the water supply) to all citizens is privatized, its new owner(s) could lead to the abandoning of the social obligation to those who are less able to pay or to regions where this service is unprofitable. Even the World Bank has called for a "rethink" of privatization policies, with the argument of the negative impact of a profit-driven service delivery model on workers, low-income households, and the environment. Some municipalities have experienced the effects of privatization, making this level of government a key player in public–private debates. Many municipalities are frustrated with the broken promises, service cutoffs to the poor, the lack of integrated planning, and pressures from international institutions forcing them to contract out to private firms. As a result, many municipalities have begun to push back. This trend is making practitioners and policy makers question the neoliberal ideology of market-based service delivery (McDonald et al. 2012).

A striking fact about the re-municipalization of Paris waters is that it has been a highly political move undertaken with little public pressure or participation. Instead, there were numerous and detailed audits proving the potential for financial savings, more than arguments about managing water as a "public good." The transition was difficult, particularly on the financial management side and in terms of personnel. But despite these challenges, the return to in-house delivery provided impressive financial outcomes. Overall, the preliminary assessment is encouraging, with Paris' water systems moving from opaque, fragmented, and short-term management to a more integrated, transparent, longer-term, and progressive approach. A similar process occurred in some other European cities such as Grenoble (France). Italian citizens recently voted in a referendum against privatization of municipal public provision of water service.

Since the early 2000s, public enterprise in Cologne (Germany) has undergone a major transformation. This has seen the creation of the country's largest municipal service consortium and the return into public hands of key public services like waste management.

The local government of Barcelona (Spain), currently ruled by a progressive party, is now trying to re-municipalize the water service. This service is now provided by a private company, and the municipality is paving the way so that the service is again provided in-house. This is not the only service the municipality wants to retake, and experts announce great budget costs of this re-municipalization process, since huge compensations will have to be paid to the private companies that are currently providing the municipal services.

In other services, such as electricity, re-municipalization occurs mainly in Germany. Reasons for this trend are low quality of service, high costs, end of contracts, and higher control by the municipality. In municipal public transportation, British and French local governments are leading the process of re-municipalization. Regarding urban waste management, Germany and France are mainly retaking its provision in-house. The re-municipalization of street cleaning is taking place mostly in the UK and Germany.

## Conclusion

The diversity of experiences at the local level in Europe, in terms of privatization, is extensive. The privatization took place mainly in the UK and the Netherlands. In the remaining European local governments, the changes have been slower. This aspect of governance appears to be an Anglo-Saxon idea, with only the Netherlands trying to imitate this philosophy. Municipal privatization has attracted local governments with fiscal stress by the promise of cost savings and higher, private-financed, investment. In the southern European local governments, the strong central state is hidebound by legal rules, procedures, and professional corps. Local bureaucrats and

politicians are less focused on the quality of services and are less likely to find reforms attractive. The evidence suggests that NPM reforms found their natural expression in some northern countries, but did not transfer to the classic southern countries. The attraction of municipal privatization is Western Europe-wide and cannot be restricted to the north. Rather than a strict north–south divide, a variegated pattern has emerged. The adoption of these ideas is particular to contexts. Ideas cross nations and between levels of government. Reformers adapt them to fit in with their own systems of government. Ideas may also engage with older practices. In Scandinavia many of the management reforms followed on from the previous experiments with private sector ideas in the corporate management revolution (John 2001).

As an attempt to summarize, we can point out these three keys on the privatization of local government services (Goodman and Lovemen 1990):

1. Neither public nor private managers will always act in the best interests of their shareholders (agency problem). Privatization will be effective only if private managers have incentives to act in the public interest, which includes, but is not limited to, efficiency.
2. Profits and the public interest are best intertwined when the privatized service is provided in a competitive market. It takes competition from other companies to enhance managers' behavior.
3. When these conditions are not met, continued governmental involvement will likely be necessary. The simple transfer of ownership from public to private hands will not necessarily reduce the cost or enhance the quality of services.

Liberalization and privatization of public services have largely negative effects on employment and working conditions and varied effects on productivity and service quality. Positive effects and better performance as compared to other countries were mostly the result of superior regulation rather than of competition or private corporate initiative. Privatization has also led to inequality among consumers depending on their consumer power or the place where they live. Hence the nature of service provision should not be left to the "free" role of market forces, but ensured by strong, comprehensive, and accountable regulation that makes sure that all important quality aspects are met and that the universal character of public service provision is retained (Hermann and Flecker 2013).

# Privatization of Education in Australia

Robert Lewis
University College, University of Tasmania|, Newnham, Australia

## Synonyms

Australian education; Education; Government failure; Privatization; Rent-seeking; VET fee-help; Vocational training

## Introduction

The Australian educational system consists of the three major "pillars." The first, the schools sector in which senior secondary educational certificates are issued upon the completion of year 12. The second, the Vocational, Educational, and Training (VET) sectors aimed at providing students with the skills to become "job ready." Credentials for students graduating from the VET sector can range from certificates, through to diplomas and advanced diplomas. The final pillar is the Higher Education Sector or universities, which awards diplomas, degrees, and advanced degrees.

This entry details the period from 2009–2015 when the Australian Government deregulated the Vocational Education and Training (VET) sector and by doing so, it is argued, enabled opportunistic and unscrupulous providers to take advantage of the large financial sums available by using aggressive and inappropriate marketing techniques. In 2008, the Rudd Government introduced the VET Loan scheme enabling students to apply for a government loan to pay for a VET course. The Australian Government simultaneously allowed private operators to enter the field in competition to public entities (such as TAFE) by deregulating the industry. The Australian government opened up the VET sector to competition in deregulating the sector or more particularly, "contestability" whereby the government's intention is to introduce private competitors to challenge the public provider to be more "nimble" and achieve greater customer service and efficiencies (Rea 2015). Sahlgren (2014) argues that while there may be benefits to privatization, for it to function well there must be well-designed system incentives to counter the more opportunistic of providers, or as Krueger (1974) calls them, rent-seekers. Businesses who look to rent seek are in effect distorting the market leading to a divergence between the private economics and the social good of the service.

## The VET Sector Design and Implementation

VET has a long history starting with the Technical and Further Education (or TAFE) as the government-funded provider of post-secondary vocational education. Since Federation, TAFE and its previous iterations have been the sole provider for all educational and training purposes, except for employers who might provide their own nongovernmental funded training courses to employees. Since the mid-1990s, various Australian governmental policies have seen a move from TAFE to the VET system. Designed in response to cost pressures from TAFE, the VET sector is now seen as encompassing both the public TAFE and the private and community education and training arena (usually private educational providers), and TAFE is now considered as one part of the VET system, albeit a major part. In 2008, the State Victorian Brumby Labor government announced the introduction of the Victorian Training Guarantee. Under this Guarantee, eligible students were able to choose to study with any VET provider, in direct competition to TAFE. Other Australian states followed a similar policy, which saw private providers issuing credentials that were previously the domain of TAFE. Up until the late 2000s, the students of private providers would pay the private organization for its services, and costs were kept under control through the normal supply and demand equation, that is, if services were too expensive students would seek a lower cost provider, such as TAFE. This equation all changed in 2008 when the

Australian Federal Government introduced the VET FEE-HELP Scheme as part of the Commonwealth's Higher Education Loan Program (HELP). Since 1989, the Higher Education Sector had the Higher Education Contribution Scheme (HECS), introduced by the Education Minister John Dawkins as part of the Labor Government reforms to the university sector at that time. All students enrolled in a university place were required to make a part contribution payment to the cost of their education, in the form of a Commonwealth backed loan (HECS). Students with a HECS debt would pay it back in fixed percentage amounts once individual incomes reached a predetermined amount; the current repayment threshold for 2017 is A$54, 869.

The VET FEE-HELP duplicated, to some extent, the HECS system with one important distinction that the government does not set prices for VET courses – service providers (or Registered Training Organisations – RTOs) can charge whatever the market will bear. The student therefore will be required to pay for the full cost of the course through a VET HELP loan from the commonwealth that led to students becoming liable for large financial commitments.

## The VET Sector: Analysis of the Financial Implications

Since the introduction of VET FEE-HELP in 2009, loans have exponentially increased each year and stand (as reported by the Department of Education and Training) at $2,925 M at end of year 2015. Relaxed standards as to who could become RTOs under the legislation may have contributed to this increase. Prior to 2012, all courses offered needed to be able to articulate into the Higher Education Scheme through transfer of credits and therefore universities have to recognize the course as having sufficient merit and quality to be acceptable for credit or a pathway up to university. This naturally set the bar high on the courses and the quality of service provider. Under the conservative Abbott government, this requirement was removed and the standards for entry for registration as a training provider greatly lowered. Reduced barriers to entry led to a 570% increase in RTOs between 2009 and 2015 as they entered the market and started competing for students. Rather than a demand-driven market from the students, it became a demand-driven market created by the RTOs, which saw the number of students accessing VET FEE-HELP (VFH) increase from 5,262 in 2009 to 272, 026 in 2015. Indeed, the commitment per student to VFH loans also increased, from an average loan per student of $4, 861 in 2009 to $15, 114 in 2015. Increased student numbers, increasing student debt, and increasing RTOs offering training courses led to high financial commitment from the Commonwealth as these financial benefits accrued to the RTOs. The total commitments from the Commonwealth to the educational providers increased from $25.6 m in 2009 to $2.9 billion in 2015.

Introducing the VET FEE-HELP scheme to private providers and allowing them access to government funding has led to a demand-driven increase in educational services from the perspective of the private operator using increasingly aggressive marketing tactics to attract students. Due to the large financial returns on offer, the market became attractive to the more opportunistic organizations not particularly concerned with student educational outcomes and more concerned with the business bottom line. This led to some dubious marketing practices and business behavior, primarily due to the remuneration structure of the sales staff of the VET providers. The training colleges hire "brokers" as an intermediary between the colleges and the salespeople (whose sole function is to market the courses and provide the salespeople to sign clients to the course). RTO providers pay brokers reported sums of up to $5000 per student who in turn pay the salespeople up to $1000 for each student signed (Bachelard et al. 2015). Brokers paid on commission have no real incentive to accurately represent the courses or provide advice about which courses would suit or not suit a client or even be concerned if a student has the ability to complete a course. In a government inquiry into the VET scheme, Speech Pathology Australia cited one provider who was advertising a Certificate IV in an allied health

course implying that it is a "speech pathology" course without making any reference that in no way would the student be able to practice as a "speech pathologist" on completing the course (Committee 2015).

## Rent-Seeking Behavior and Marketing Practices

The marketing techniques of VET colleges to attract and retain students has been concerning. There is evidence of high-pressure sales and marketing techniques of VET colleges in order to attract and retain students. Examples include targeting disadvantaged clients, making untrue promises of "free" equipment and other financial inducements, making false and misleading representations that the course is "free" and that employment opportunities are abundant. Sales people specifically target those living in public housing and non-English speakers. They would set up stalls outside welfare offices in order to approach recipients looking for educational opportunities, target vulnerable migrants and the elderly. Prospective students who were elderly were encouraged to look at the loan as one they would never have to pay back as it would be highly unlikely pensioners would be earning above the required amount to have to pay it back in the coming years. Potential students would be offered a free computer/iPad and cash incentives, having little understanding that they were agreeing to pay back a loan in order to fund the course. Examples abound of salespeople signing clients up to inappropriate courses; The Redfern Legal Centre (in the Government inquiry) cited the example of a client who wanted to do hairdressing but was instead enrolled into a course on how to manage a hairdressing salon (Committee 2015, p. 38). Further evidence cited details how "Inclusion Australia" an advocacy group for people with disabilities reported that RTO salespeople were outside their premises approaching clients as they tried to enter the disability service.

Quality control issues also became apparent – highlighted by the lack of pedagogy taking place and the short amount of time allocated for the course. For example, one college was reported to be offering an advanced diploma in only 2 weeks whereas such a qualification from TAFE (with the volume of teaching and learning required) should be about 2 years. In addition, courses were excessively expensive, for example, a Double Diploma of Business and Management from one provider was costed at $23,250, whereas a similar course from TAFE was only $6,800.

The Australian Chamber of Commerce and Industry has also identified that providers are basing their course offerings on gaining access to government funding and ignoring the needs of students in regards to training for employment. For example, there is an abundance of business courses as they attract significant government funding, while other courses (such as carpentry or plumbing) are not offered due to the low profitability of those deliveries. The Australian Council of Trade Unions has identified courses in hypnotherapy, aromatherapy, and Christian proselytizing as courses that have been given priority due to government funding and cost-effectiveness of delivery (ACTU submission 38, Committee 2015).

A key concern in regards to quality is that graduates are coming out of these courses with insufficient knowledge to be able to be job ready. Evidence was provided in the government inquiry from former tutors that students were continually tested and retested until they passed. Pressure was put on tutors to pass a student even though they did not meet the requisites for a pass grade, or to ignore clearly plagiarized work and mark it as if it was the student's own work. Public safety issues also present itself if students are not adequately prepared for a job, for example, a tradesman unable to erect scaffolding or being unable to operate equipment. Ms. Sue Bond Head of the Guild Pharmacy Academy was asked in the inquiry about her concerns about the level of training and cited a pharmacist who had rang her about a pharmacy assistant who has a certificate III but did not know what an analgesic was. The Australian Skills Quality Authority (ASQA) who hold dual responsibility for vetting qualified applicants to deliver a VET course regulates all RTOs, since 2011, and the accreditation of said

courses delivered. However, a department of Industry report from 2014 found that a significant portion of RTO providers (40%) did not have formal pedagogic qualifications. Usually educators held a Certificate IV in Training and Assessment (the qualification needed to teach at the VET level). Additionally, it was found that there are poor enforcement activities by the regulators against RTOs who were seen to be breaching the regulations; PriceWaterhouseCoopers found that approximately 79% of RTOs were not compliant with the regulations – however they contributed this to misunderstanding of the regulations rather than malice.

## Government Response

It became obvious to the service providers in the system that large financial rewards were possible through capturing part of the market. Intense competition for the growing student demand saw unscrupulous operators enter the market to access the large financial benefits that would flow and promote their services to what may be described as unsophisticated and uninformed consumers. The large increase in providers, from 39 providers in 2009 to 261 in 2015, had come about due to the market dynamics making the system attractive to entrepreneurs. This increase has seen intense competition for students evidenced in consumers targeted in aggressive marketing campaigns as mentioned previously.

Aggressive marketing techniques led the Australian government to ban, from the 1st April 2015, all private providers from offering any financial inducements to sign up such as free laptops or cash and to stop some of the more aggressive marketing techniques like going to nursing homes, or purporting that the courses are "free" or "government-funded." The Assistant Minister for Education and Training, Simon Birmingham, released a statement with further measures to stop unscrupulous marketing such as stopping the more insidious marketing practices, stopping the practice of using "brokers" to sign students, and making it easier for students to cancel debt if they have been signed up in an inappropriate manner (Birmingham 2015). These features have had a significant effect in ensuing year. VET loans for 2016 decreased from $2.92 billion to $1.47 billion and student numbers decreased by 24% from 2015 numbers.

Since the 1st January 2017, VET FEE-HELP has ceased and been replaced by "VET Student Loans." Students are now required, by legislation, to be fully informed of all their financial obligations and making it clear that they are entering a VET loan with repayment obligations. The website "Study Assist" has been setup to provide information to all students into how VET loans operate and provide information to students to make informed judgments as to the level of debt they will incur, as well as the qualifications to enter a particular job, and expected course length. Enshrined in the legislation is the means to ensuring that student debt is in-line with the course duration and rigor, and ensuring that providers assess the capabilities of students to undertake the course to completion and provide evidence that the assessment has taken place. The legislation also makes it easier to remove debt that has been placed in error or by false representations, and ensuring that all providers are financially stable and delivering courses to a high level of competency.

While it is too early to ascertain the effects on private colleges and student achievement at the time of writing (2017), already there are reports that registration requests from new colleges are declining significantly. Just before the new standards took place, there were many requests for registration from colleges believing erroneously that they were assessable under the old regime. In January 2017, of the 18 applications assessed, one was rejected, with the remainder asked for further clarifying details from the regulators. Of those 17 applications, 11 withdrew and the 6 remaining have not submitted any further details.

## Conclusion

The VET Scheme Loan and the failures of the program have highlighted the difficulties that governments face in deregulating public services into

the private sphere. Government failure is a very real possibility particularly if the design of the program is conducive to attract rent seekers and unscrupulous operators are prepared to take advantage of lack of policy standards and lack of over-sight. Business has demonstrated several times that it behaves poorly in response to deregulation. The reasons for that are many; Fassin (2005) points to a decline in business ethics exhibited in unfair practice, unethical behavior and abuse of power, unfair competition, and lack of respect for agreements.

Governments will always seek to privatize/deregulate services either because of a belief that deregulation provides cost savings to the budget or that it provides better outcomes to the community, or both. The danger is in not designing the system so that it takes the form of opportunistic deregulation with all the inherent flaws that flow from that particular model. In fact, the Australian Government appears to have learned that particular lesson with the drafting of new legislation that attempts to write policy to stop rent-seeking behavior and protect the community. The Australian government had intended introducing the VET Fee Help model into the university sector, following the election of the conservative Abbott government, whereby private operators would be able to offer degrees to students and the current higher education fee help scheme would be deregulated. This policy was abandoned in 2016 due, in part, to the evidence presented of the effect such a policy had on the VET sector, and in part to the opposition parties refusing to pass the legislation in the Senate.

The way forward for the Australian educational system is continuing vigilance of proposed governmental policy and legislation and to ensure that deregulation policies are fully vetted and further strengthened to avoid a repeat of history.

# Privatization of State-Owned Enterprises in Indonesian Manufacturing Industry

Maman Setiawan and Ernie Tisnawati Sule
Faculty of Economics and Business, Padjadjaran University, Bandung, Indonesia

## Synonyms

Firm ownership; Government control; Private enterprise; Productive efficiency; Public enterprise; Transfer of state ownership

## Definition

State-owned enterprise (SOE) is an enterprise where the government has full, majority, or significant ownership of the firm enabling the government to fully control the firm. In Indonesia,

the government can have a full control on the SOEs if it has at least 51% of the ownership share. The privatization is a mechanism applied by the government to transfer its ownership to the public or private firm. The privatization is supposed to improve the efficiency of the companies. The efficiency is related to efforts of the firm to reduce the waste in using the resources. The technical efficiency can be defined as the ability of the firm to expand its output using the same input or contracting its input using the same output.

## Introduction

State-owned enterprises (SOEs) in the manufacturing sector contribute significantly to the Indonesia economy with its contribution about 10% to the total manufacturing output in the period of 1980–2015, on average. The number of the SOEs in the manufacturing industry also reached about 25% of the total number of SOEs in Indonesia in 2015 (see Setiawan and Tisnawati Sule 2018). With its significant contribution, the performance of the SOEs can significantly affect the Indonesian welfare.

Regarding the performance of the SOEs, three main theories i.e. property right theory, agency theory and public choice theory may explain the nature of the SOEs performance (see Bozec et al. 2002). Those theories suggest that the performance of the SOEs will not always be at the optimum level with a tendency to be lower than the private firms. Thus, most of the jurisdictions have been privatizing their SOEs to avoid the higher loss to the economy.

With respect to the privatization, Indonesian government has been privatizing the SOEs in the manufacturing sector since 1980s. In 1987, 7 SOEs operating in manufacturing and non-manufacturing sectors were privatized. Also 52 SOEs having business in manufacturing, finance, agriculture, and service were planned to be privatized in 1989. Based on the Indonesian Law No. 19 year 2003 about the SOEs, the privatization can be done through three ways: (i) direct stock sales to the investor, (ii) initial public offering (IPO) through the stock market, and (iii) stock sales to the employee or management. The privatization causes the government to have less control to the privatized SOEs. The selling of the stock share to more than 50% will result in the loss of the government control on the SOEs.

The privatization is expected to increase the efficiency of the firms, since the privatized SOEs have less political interferences compared to the condition before the privatization. The political interferences in the SOEs may usually result in the poor choices of inputs, low quality of product, and less incentive for the managers (see Shleifer and Vishny 1994). Therefore, the privatization may improve the choice of the inputs and the quality of the products increasing the technical efficiency of the privatized SOEs.

## Literature Review

Previous research has investigated the effect of the privatization on the technical efficiency of the state-owned enterprises. Chirwa (2001) investigated the privatization and its effect on the technical efficiency of the manufacturing sector in Malawi during the period 1970–1997. The technical efficiency is estimated using data envelopment analysis. The research found that the privatized firms had higher technical efficiency after the privatization. Al-Obaidan (2002) investigated the effect of the privatization on the efficiency of the 45 developing countries in 1980s. They applied frontier production function to account efficiency differences between countries with different degrees of the private sector contribution on the economy. They found that after the privatization the developing countries can increase the utility of their natural resource by 45%. Shi and Sun (2016) investigated the effect of the privatization in the China during the period 2001–2010. They applied regression model and Cobb-Douglass production function to estimate the firm performance and productivity, respectively. They found that the privatization improved efficiency and productivity in the China. Plane (1999) also investigated the effect of the privatization on the productive efficiency in

the Cote d'Ivoire electric power company for the period 1959–1995. The research applied the stochastic production frontier to estimate the productive efficiency. The research found that the productive efficiency improved after the privatization because of the organizational innovations. In addition, Boussofiane et al. (1997) investigated the technical efficiency of nine privatized organizations in the UK in 1980. The research used data envelopment analysis to estimate the technical efficiency before and after privatization. The research found that the positive effect of the privatization on the technical efficiency applied only for some privatized organizations. Moreover, Yu and Fan (2008) investigated the effect of the privatization on the technical efficiency in the Taiwan's Intercity Bus Services. They found that there is a significant increase in the technical efficiency of the firms after the privatization. The previous research explaining about the technical efficiency of the SOEs and its relation with the privatization in other countries had been investigated. It is still rare to find a same research in the Indonesian economy. Thus, it is important to investigate the technical efficiency and its changes after the privatization in the Indonesian economy.

## Modeling

This research uses data envelopment analysis with a bootstrapping approach to estimate the technical efficiency. The data envelopment analysis requires very few assumptions about the properties of the production possibilities set, since it applies a mathematical linear programming to measure the efficiency (Setiawan et al. 2012). The technical efficiency score estimated by the DEA is based on the transformation of $N$ inputs into the $M$ outputs for all $I$ firms. Suppose the column vectors $x_i$ and $q_i$ represent input and output for the *i-th* firm, respectively. The consecutive $NxI$ input matrix, $X$, and the $MxI$ output matrix, $Q$, represent the data for all $I$ firms. The output-oriented DEA model (The output-oriented DEA estimates the technical inefficiency by having a proportional increase in output, given the same inputs. The rigidities in the inputs faced by the firms make this assumption relevant in the Indonesian economy (see Setiawan et al. 2012).) is applied by having the mathematical linear programming model as follows:

$$\begin{aligned} &\max_{\phi,\lambda} \phi, \\ &\text{st} \quad -\phi q_i + Q\lambda \geq 0, \\ &\qquad x_i - X\lambda \geq 0, \\ &\qquad I1'\lambda = 1 \\ &\qquad \lambda \geq 0, \end{aligned} \tag{1}$$

where $\phi - 1$ can be defined as a proportional increase in outputs that could be achieved by the $i$-th firm or SOE given the same amount of input quantities. This research also applies a Farrell approach to avoid getting a negative efficiency score because of the high variabilities of inputs and outputs. This measures the technical efficiency to get an efficiency score which varies from 1 to infinity. The variable return to scale (VRS) is also applied to the DEA by having $I1'\lambda = 1$ as a convexity constraint with $I1$ as an $Ix1$ vector of ones and $\lambda$ as an $Ix1$ vector of constants. Furthermore, the final technical efficiency score is calculated from $1/\phi$ $(\widehat{\delta}(x, y))$ as a value in the unit interval as also applied by Setiawan et al. (2012).

The research also applies the DEA with a bootstrap technique of Simar and Wilson (1998) to get a robust estimate of the technical efficiency score. The bootstrapping approach uses a repeated simulation of the data generating process by using a resampling method and applying it to the original estimator. The simulated estimates can be identical to the sampling distribution of the original estimator. The biased-corrected efficiency score from the bootstrapped method is applied using the formula:

$$\begin{aligned} \widehat{\widehat{\delta}}(x, y) &= \widehat{\delta}(x, y) - \text{bias}_B\left[\widehat{\delta}(x, y)\right] \\ &= 2\widehat{\delta}(x, y) - B^{-1}\textstyle\sum_{b=1}^{B}\widehat{\delta}_b^{*}(x, y) \end{aligned} \tag{2}$$

with the condition of sample variance

$$\widehat{\delta}_b^*(x, y) < \frac{1}{3}\left(\widehat{\text{bias}}_B\left[\widehat{\delta}(x, \quad y)\right]\right)^2 \qquad (3)$$

This research applies $\widehat{\delta}(x, y)$ and $\widehat{\widehat{\delta}}(x, y)$ representing the original and biased-corrected efficiency scores, respectively. The $\widehat{\delta}_b^*(x, y)$ is a final bootstrap estimate of the efficiency score which is generated from B samples with b = 1,. . .,B.

This research also applies analysis of variance (ANOVA) to test the differences between average technical efficiency of the SOEs in the subsectors before and after privatization. ANOVA test is based on the variance analysis between the two groups of the subsectors. The higher the differences of the variance between the two groups, the higher the possibility of the test to reject the null hypothesis of the no differences of the variance between the two groups of the subsectors. The ANOVA will be applied for the groups of all subsectors, only subsectors with increasing technical efficiency after privatization and only subsectors with decreasing technical efficiency after privatization.

## Data

This research uses establishment-level data to estimate the technical efficiency of the firms pooling both SOEs and non-SOEs. To compare the technical efficiencies of the SOEs in the subsectors between pre- and post-privatization, the research only takes the technical efficiency scores of the SOEs. The technical efficiency of the subsectors is obtained by averaging the technical efficiency of the SOEs in the subsectors. The data are sourced from the Annual Manufacturing Survey provided by the Indonesian Bureau of Central Statistics (BPS) covering the period from 1980 to 2015 in which the data of the SOEs can be obtained.

There are about 400 subsectors in the Indonesian manufacturing industry. Each subsector may include both SOEs and non-SOEs in the period from 1980 until 2015. The subsectors having less than 30 observations are combined into a new subsector in the same digit of ISIC 4 (four) or 3 (three) level to have at least 30 observations. (For example, subsectors of 10110, 10120, and 10130 were combined into a new subsector of 10100 to have at least 30 observations in every single year.) Also the subsectors without having the SOEs during the period 1980–2015 are dropped. Finally, this research uses 146 subsectors classified into 5-digit International Standard Industrial Classification (ISIC) level. This research defined the privatization as the changes of the government ownership on the SOEs to become less than 51%. The government has no dominant control anymore on the SOEs if its stock ownership is less than 51%.

The firms in the manufacturing industry transform labor, raw material, and fixed capital such as machines, equipment, etc. into the output (see Setiawan et al. 2012). Production output is defined as the value of gross output produced by the firms and deflated by the Wholesale Price Index (WPI). This research also applies a proxy of labor efficiency units to represent the labor. (We define the labor efficiency units as used by Setiawan et al. (2012): L = Number of production worker + number of other worker* $\left(\frac{\text{Salary of other worker}}{\text{Salary of production worker}}\right)$) Raw material is represented by the total costs of domestic and imported materials (The raw materials include not only materials but also other costs related to the production such as electricity and fuel cost.) and is deflated by Wholesale Price Index (WPI), respectively. Fixed assets measure the fixed capital which is deflated by the WPI of machinery (excluding electrical products), transport equipment, residential, and nonresidential buildings.

Table 1 shows the descriptive statistics of the variables including input and output variables used for the technical efficiency estimation using the DEA across firms and subsector period 1980–2015. Table 1 shows that all variables had high variability. This is shown by the high standard deviation for every variable. The high variation of data can be caused by the long period of 1980–2015. The high variability of the data can also be caused by the variation across the subsectors. Moreover, fixed capital had the highest variation of the data among the other inputs and output variables with the mean and standard

**Privatization of State-Owned Enterprises in Indonesian Manufacturing Industry, Table 1** Descriptive statistics of the variables across firms and subsectors, 1980–2015

| Variable | Mean | Standard deviation | Maximum | Minimum |
|---|---|---|---|---|
| Output (in thousands Rupiah) | 386114.700 | 3691963.000 | $7.950*10^8$ | 102.802 |
| Labor (person index) | 816.904 | 8618.203 | 174992.100 | 4.000 |
| Capital (in thousand Rupiah) | $1.020*10^7$ | $6.300*10^9$ | $4.25*10^{12}$ | 100.000 |
| Material (in thousand Rupiah) | 287855.000 | 2391415.000 | $6.440*10^8$ | 100.037 |

Source: Authors' calculation

deviation of $1.020*10^7$ and $6.300*10^9$, respectively. In spite of this, the high variability of data will not affect the estimation of the technical efficiency significantly, since the estimation of the technical efficiency is applied for every year in each subsector. Furthermore, the DEA estimation which applies the VRS approach naturally benchmarks each firm to the best practice of the other firms with the similar sizes.

**Privatization of State-Owned Enterprises in Indonesian Manufacturing Industry, Table 2** Number of privatized firms, 1980–2015

| Period | Average number of privatized firms in Indonesian manufacturing sector |
|---|---|
| 1980–1990 | 45 |
| 1991–2000 | 71 |
| 2001–2010 | 46 |
| 2011–2015 | 47 |
| 1980–2015 | 53 |

Source: Authors' calculation

## Results

Table 2 shows the number of privatized SOEs in the Indonesian manufacturing industry during the period 1980–2015. The number of the privatized SOEs was based on the establishment data. Table 2 shows that there was a significant increase of the number of privatized SOEs from the interval period of 1980–1990 to the interval period of 1991–2000. The number of privatized SOEs was 45 in the interval period 1980–1990, and the number increased to 71 SOEs in the interval period of 1991–2000. The number of privatized firm was the largest in the interval period of 1991–2000. This may be an indication that the plan of the privatization in 1989 went as the plan in 1990s. Furthermore, this might also happen because the privatization was the priority program stated in the letter of intent (LOI) between Indonesia and the International Monetary Fund as a return of the support from IMF to resolve the economic crisis in Indonesia occurring during the period 1997/1998. The number of privatized firms decreased in the interval period of 2001–2010 compared to the previous interval period, but the number of privatized SOEs increased again in the interval period of 2011–2015. The average of the number of privatized SOEs was 53 during the period 1980–2015. The fluctuation of the number of the privatized firms was also related to the different regulations as well as the different regimes in the Indonesian government during the period.

**Privatization of State-Owned Enterprises in Indonesian Manufacturing Industry, Table 3** Technical efficiency of the SOEs before and after privatization across subsectors, 1980–2015

| Period | Technical efficiency before privatization | Technical efficiency after privatization |
|---|---|---|
| 1980–1990 | 0.55 | 0.60 |
| 1991–2000 | 0.46 | 0.50 |
| 2001–2010 | 0.45 | 0.46 |

Source: Authors' calculation

Table 3 shows the average technical efficiency of the privatized and non-privatized SOEs across subsectors during the period 1980–2015. The average technical efficiency of the privatized SOEs was larger than the average technical efficiency of the non-privatized SOEs during the period 1980–2015. In the interval period of

1980–2015, the average technical efficiencies of the privatized and non-privatized SOEs were 0.51 and 0.48, respectively. The average technical efficiency of the SOEs declined for both privatized and non-privatized SOEs during the period of estimation. For example, the average technical efficiencies of the SOEs were 0.60 and 0.55 for privatized and non-privatized SOEs in the interval period of 1980–1990, respectively. The average technical efficiency decreased to 0.45 for both privatized and non-privatized SOEs in the interval period of 2011–2015, respectively.

Table 4 shows the percentage of the subsectors in which the privatized SOEs exhibited increasing and decreasing average technical efficiencies after the privatization. Percentage of the subsectors with increasing technical efficiency after privatization was 53%. The percentage of the subsectors with increasing technical efficiency was larger than the percentage of the subsectors with decreasing technical efficiency which reached about 47%. Although more than half of the subsectors experienced increasing technical efficiency after the privatization, the privatization might not always guarantee that privatized SOEs will be more technically efficient. Okten and Arin (2006) suggested that other environmental factors could also influence the effect of the privatization on the efficiency.

Table 5 shows the percentage of the subsectors with increasing and decreasing technical efficiency after the privatization classified into low technology level, medium-low technology level, medium-high technology level, and high technology level. The classification is based on the grouping from the United Nations Industrial Development Organization (UNIDO). Table 5 shows that the percentage of the subsectors having decreasing technical efficiency after the privatization were 54.41% coming from the subsectors with low level of technology. Only 50% of the subsectors with increasing technical efficiency after privatization were classified as the subsectors with low level of technology.

**Privatization of State-Owned Enterprises in Indonesian Manufacturing Industry, Table 4** Percentage of subsectors with increasing and decreasing technical efficiencies after privatization of the SOEs period 1980–2015

Table 6 shows 20 of the 78 subsectors in which the privatized SOEs exhibited increasing average technical efficiency after the privatization, and they had the largest average technical efficiencies after the privatization. From Table 6, it shows that subsectors classified as medium-high technology industry, medium-low technology industry, and low technology industry were four subsectors, eight subsectors, and eight subsectors. This indicates that 60% of the 20 subsectors exhibiting increasing average technical efficiency came from the subsectors with medium-low and medium-high technology industry.

Table 7 shows the 20 of the 68 subsectors in which the privatized SOEs exhibited decreasing average technical efficiency after the privatization. The 20 subsectors also had the lowest-average technical efficiency score during the period 1980–2015. The subsectors classified as high technology level, medium-high technology level, medium-low technology level, and low technology level were 1 subsector, 4 subsectors, 3 subsectors, and 12 subsectors. From Table 7 it is seen that the 20 subsectors having decreasing technical efficiency after the privatization dominantly came from subsectors classified as low technology

level. About 60% of the 20 subsectors with the decreasing technical efficiency came from the subsectors classified with the low technology level.

Tables 6 and 7 may give an indication that privatization most likely had positive effect on the technical efficiency on the industry with higher level of technology. The privatization of the firms in the higher level of technology may boost the economies of scale because of the improved inputs and outputs boosting the technical efficiency. Nevertheless, the privatized SOEs exhibiting decreasing technical efficiency may consider other environmental factors that can affect the technical efficiency (see Setiawan and Tisnawati Sule 2018).

Table 8 shows ANOVA test to determine whether there is a difference between technical efficiency before privatization of the SOEs and technical efficiency after privatization of the SOEs. The ANOVA test was based on the subsector level comparing between the technical efficiency of the subsectors before the SOEs were privatized and after the SOEs were privatized. The technical efficiency of the subsectors is the average technical efficiency of the SOEs in the respective subsector. The ANOVA test was also applied for both groups of subsectors in which the privatized SOEs exhibited decreasing and increasing average technical efficiency after the privatization.

From Table 8, it is shown that there were no significant differences of the average technical efficiency between before and after privatization for all subsectors at the 10% critical level. In spite of this, the results were different if the tests were based on the only subsectors with increase technical efficiency after privatization or the only subsectors with decreasing technical efficiency after the privatization. Table 7 shows that there were significant differences of the technical efficiency before and after privatization for the two

| Group | DF | F-statistics |
|---|---|---|
| All subsectors | df1 = 1; df2 = 290 | 0.010 |
| Subsectors in which the privatized SOEs exhibits decreasing average technical efficiency after the privatization | df1 = 1; df2 = 134 | 11.697*** |
| Subsectors in which the privatized SOEs exhibits increasing average technical efficiency after the privatization | df1 = 1; df2 = 154 | 14.195*** |

Source: Authors' calculation
Note: *** denotes significance of the test statistic at the 1% critical level

groups at the 1% critical level. The subsectors in which the privatized SOEs exhibited decreasing or increasing average technical efficiency after the privatization had a different average technical efficiency significantly compared to the average technical efficiency before the privatization. From the Table 7 and previous tables, it is concluded that more than half of the privatized SOEs improved their efficiencies in the respective subsectors significantly, but the other privatized SOEs worsen their efficiencies in the respective subsectors significantly.

## Conclusions

This research investigates the impact of the privatization on the technical efficiency of the

privatized SOEs in the Indonesian manufacturing industry. This research uses the data from the Indonesian Bureau of Central Statistics during the period 1980–2015. The ANOVA test is also applied to test whether there is a difference of the technical efficiency of the subsectors between pre- and post-privatization.

This research found that the technical efficiency of the SOEs in the Indonesian manufacturing sector was low. Furthermore, the improvement of the average technical efficiency after the privatization happens not to all SOEs. The ANOVA tests suggest that the privatization may increase or decrease the technical efficiency of the SOEs significantly in the subsectors after the privatization. These results may suggest the government to carefully consider the SOEs that will be privatized. The SOEs should be feasible and able to give a good impact on the efficiency as well as on the market after the privatization.

## Synonyms

Denationalization; Joint venture; Public-private partnerships

## Definitions

| | |
|---|---|
| Independent Water and Power Producers | Private companies that enter into a joint venture with the government |
| Single Buyer Model | The designation by the government of a single entity as the buyer of water and energy produced |
| Utilities Sector | Government sector responsible for providing basic utilities such as water and energy |

| | |
|---|---|
| Water-Energy Nexus | The simultaneous generation of water and energy in a single proximal space |

## Introduction

Privatization as an instrument of economic policy was one of the economic reforms adopted by many countries in the past decades and is considered today as a significant economic and political strategy shaping the global economic landscape (Guriev and Megginson 2005). With the increasing momentum of privatization worldwide, countries in the Arab world are no longer faced with the choice of whether to privatize or not. The more important challenge is how these countries privatize their state-owned enterprises while taking cognizance of the lessons from the privatization practices and experiences of countries in the global context (Megginson and Netter 2001).

State-owned enterprises are an important feature of the economic landscape in many Arab countries and are looked up to as anchors of national development and competitiveness (OECD 2005, 2010). What makes privatization different in these countries is that their circumstances vary from those of developed and developing countries primarily when it comes to the drivers of privatization when seen in the context of their culture, history, and economic development (Afridi et al. 2015). The Gulf countries, for instance, are not cash-strapped, and privatization is seen as a means of getting access to many forms of private know-how which is scarce in the regional context; hence they do not see the need to make trade-offs between internal fund-raising and long-term structural reforms (Al Hashemi 2016). This is reflected in the situation of Abu Dhabi which makes it a good case for understanding how specific political, social, financial, legal, and other factors inform the policy choices on privatization.

The double-digit increase in the demand for electricity and water in Abu Dhabi in the past few years is expected to escalate, and this prompted the government to strategically address the challenge by entering into contracts with private power companies to participate in its utilities sector. This led to the establishment of the Abu Dhabi Water and Electricity Authority pursuant to the Abu Dhabi Electricity Law, which is now responsible for all matters relating to formulation, development, and implementation of government policy relative to the electricity sector, including its privatization. Currently, its larger production capacity and extensive distribution network had allowed the Abu Dhabi Water and Electricity Authority to assist the other Emirates in meeting their power demand.

## Privatization of Utilities

The privatization of utilities in Abu Dhabi was largely an internally motivated initiative that was driven by the vision of His Highness Sheikh Zayed Al Nahyan, founder of the UAE and herein referred to as the leader. He had the vision to look beyond its budget surplus and understood well that the benefits from the private sector went way beyond delivery of finance (Parmigiani 2015). Hence from the start, privatization in Abu Dhabi was backstopped by strong leadership. Weak leadership can be a hindrance to privatization as shown in the privatization experiences of neighboring countries' case of Algeria, Tunisia, and Morocco (Biygautane and Lahouel 2011).

The conditions in Abu Dhabi such as its vast capital resources, business-friendly environment, transparent and accountable government, and the inspiration provided by the leader's vision to build a sustainable, open, and globally competitive economy paved the way for implementing privatization in the Emirate. In the context of the utilities sector, the government adopted the single buyer model to resolve the twin issues of providing adequate water and energy to communities in the Emirate (Alsulaiman et al. 2015).

In the conceptual template of the single buyer model, the electric power industry is no longer vertically integrated because of the entrance of new players: the Independent Power Producers. The role of the Independent Power Producers was to generate electricity and sell this to the national

power company of the country. Based on the model, there is only a single entity that acts as the buyer, and competition only occurs at the generation level.

The model was set in motion starting with the unbundling of the utilities sector in 1999 that led to the creation of the Abu Dhabi Water and Electricity Authority, Abu Dhabi Water and Electricity Company, Transmission Company, and the Abu Dhabi and Al Ain Distribution Companies, all of which are 100% government-owned. After its inception, the Abu Dhabi Water and Electricity Authority entered into joint ventures with foreign investors who were allowed a 40% ownership of the partnership. Independent Water and Power Producers operate under the signed power and water purchase agreement of 20 years with Abu Dhabi Water and Electricity Company as the sole buyer of their products. The Regulation and Supervision Bureau issues the operating licenses to the Independent Water and Power Producers and monitors the maintenance of these licenses. In contrast, the traditional model used in Abu Dhabi was the vertically integrated cogeneration of water and power where only one entity owned and took responsibility for the whole supply chain (Abu Dhabi Water and Electricity Authority 2008).

The Abu Dhabi single buyer model is a unique model in which the energy market is extensively powered by Independent Power Producers and functions under an independent regulator. There are considerable government control and oversight. Having a majority stake in the generation and a single buyer model, competition is limited except in the tendering of new generation plant. The single buyer model implemented in Abu Dhabi sector eliminates competitive pool arrangement because all production output is purchased by the single buyer. The majority of large-scale production companies are privately operated and partly owned (40%) by foreign investors. All electricity and water output is sold to the Abu Dhabi Water and Electricity Company which acts as the single buyer. This model creates a high level of certainty between producers and the Abu Dhabi Water and Electricity Company through long-term (typically 20 years) power and water purchase agreements, more commonly referred to as "offtake agreements." The bureau regulates only the Abu Dhabi Water and Electricity Company and each project company.

On the whole, the utilities sector in Abu Dhabi had demonstrated dramatic changes in the past 15 years with improved provision of services to the populace. Partial privatization has also reduced disruptions, and inefficiencies in both networks have also been greatly reduced under the new model. It is quite unique as noted by USAID (2012) as it hosts 50% of the national demand and 35% of the national demand with 96% of power generation coming from the Independent Power Producers.

A significant aspect of the implementation of privatization is the legal framework. Law 2 of 1998 concerning the reorganization of the electricity sector has been effectively crafted based on related legislations. One such legislation was the Crown Prince Decision which echoed the leader's vision on the economic development of the Emirate and also legally institutionalized these as guiding principles in crafting the law on the privatization of the utilities sector. Through the law, the leader's vision was not a matter of rhetoric but a reflection of political will. At best, privatization in Abu Dhabi is vision-driven which makes it uniquely endemic to the Emirate.

One feature of privatization in Abu Dhabi which makes it different from other privatization drives is being able to reduce rules and regulation to let the market decide what is best. An added attraction in the model is that the 11% return on investment guaranteed in the contract is generating strong competition for the Independent Water and Power Producer bids. All these features have made the Independent Power Producers and the financial sectors readily embrace the single buyer model in Abu Dhabi.

## Alignment

Measures for ensuring the alignment of the activities and processes of the Independent Water and

Power Producers with the economic goals of the Emirate were built into the preoperational phase and operational phases of the process. In the preoperational phase, templates for competitive bidding, models of various project agreements, and project documents have been created to enable alignment of processes and activities. These are reflected in the power purchase agreements, the award of contracts, ownership structure, financing, and contractual arrangements already in place.

In terms of power and water purchase agreement, there are two main components of payments to the Independent Water and Power Producers. The capacity (or availability) payments covered the fixed cost of the plant which included return on capital, depreciation, and fixed operating and maintenance cost. This was paid after the plant was made available for production regardless of the bulk of the output to be produced. The output (or energy or water) payments was (paid only for the output) actually produced by the plant. The payment rates are annually indexed against the US and UAE inflation rate or the USD-AED exchange rate. Fuel suppliers are paid directly by the single buyer for the fuel consumed by each Independent Water and Power Producer. The Independent Water and Power Producers are incentivized for fuel efficiency consumption by a bonus-penalty mechanism based on the benchmarks set or by reference heat rates.

Capacity payments and fuel costs account for about 90% of the production cost shouldered by the single buyer. In addition, the single buyer also pays shared facility cost whenever applicable.

In terms of the award of the contract, the Independent Water and Power Producers developed generation and desalination projects on a build, own, and operate (BOO) basis, where projects were awarded through a competitive bidding process. The primary bidding criterion for greenfield projects is the lowest level of tariff for the sale of water and electricity to the single buyer. For brownfield projects, the criterion is the highest asset value of given tariffs. The water and electricity authority managed the bidding process through prequalification of bidders, issues the request for proposals, and selection of the successful bidder for the projects. The successful bidder can be a single company or a consortium of companies.

In terms of ownership structure, a successful bidder and a local holding company establish an Independent Water and Power Producer as a joint stock company. The successful bidder owns 40% of the share capital of the Independent Water and Power Producer, and 60% is owned by the local holding company. The local holding company is established by the electricity and water authority that is entitled to 10% ownership, while 90% is owned by Abu Dhabi National Energy Company (Taqa).

Taqa, on the other hand, is owned by the electricity and water authority (51%) and the government-affiliated Farmers' Fund (24.1%). The remaining share of 24.9% is owned by private stakeholders who are exclusively UAE nationals. Taqa is one of the largest companies listed on the Abu Dhabi stock exchange.

The source of funding for the project comes from a combination of debt, equity, or internally generated net cash flows of the Independent Water and Power Producer. The arrangement for debt is on a nonrecourse project financing basis. In this arrangement, the successful bidder is responsible for taking care of the required financing and negotiating financing arrangement with the lenders. The debt to equity ratio is 80:20 which may be raised depending on the capital market.

A simplified contractual arrangement for an Independent Water and Power Producer is adopted where the risk is allocated to the best party, thereby making the Independent Water and Power Producer a low-risk transaction. In terms of the land lease agreement, the water and electricity authority acquires the land intended for the project. In which case, the Independent Water and Power Producer is granted an exclusive long-term leasehold on the land including easement rights for access to the land during the project duration. The land lease agreement stipulates the mutual responsibilities in relation to the use of the land and environmental impacts. Furthermore, it stipulates the conditions for the surrender of the land after the project is terminated.

## Benefits of the Privatization of the Utilities Sector

The benefits of privatization of the utilities sector of Abu Dhabi are categorized and summarized as follows:

**Efficiency gains**. For more than 15 years and nine Independent Water and Power Producer companies, the single buyer model accounted for more than 95% of generation and has provided substantial benefits for both the government and the public sector. The regulatory mandate resulted in a robust network at the transmission and generation levels at a competitive cost. This is supported by an extensive capital investment program which makes the network secure and reliable.

**Gains from strategic investors**. Privatization enables the host country to gain from the global expertise and experience of strategic investors. The provisions set by the Abu Dhabi Water and Electricity Authority for the bidding process stipulated requirements that result in the inflow of the best expertise and technology in the privatization of the utilities sector. This means that the successful bidders bring in not only new human resources and modern technology but also operational management techniques, structures, and processes. Existing employees can learn from the foreign company and improve their skills through training. This leads to further reform in the sector.

**Impact on the financial health of the sector**. Overall, privatization has impacted the returns to governments implementing privatization as well as their private partners. The good fiscal policy that streamlined financial procedures added to the financial performance of the industry.

The impact on the financial health of the sector can be seen in terms of measures such as liquidity, solvency, profitability, and financial effectiveness. By all indications, putting the sole buyer in the hands of the Abu Dhabi Water and Electricity Company guarantees that financial obligations on the sales of power and water are met on time.

**Escalating the performance benchmark**. It was evident that the unbundling of the utilities sector created regulatory authorities, managing bodies, and operational entities that rationalized the structure for privatization. The embodiment of the vision of HH Sheikh Zayed Al Nahyan in the development roadmap of the Emirate and its diligent implementation is a concrete manifestation of political will and good governance. Privatization has led to transparency and accountability not only in the practice of governance but also in reporting to the public. The institutionalized preoperational and operational arrangements between the Abu Dhabi Water and Electricity Authority and Independent Water and Power Producers ensure that both operational and financial performances are aligned to the strategic goals for privatization. Commercial management includes billing processes, customer service, and communication. The evidence for this indicator in terms of the Emirate comes in the form of the prompt and uninterrupted services provided to the customers and the outreach program of providing utilities to the farthest localities of the Emirate.

## Lessons Learned

Privatization as a strategy intends to improve service reliability and overall efficiency through the inflow of private capital, global knowledge and expertise, new management skills, and state- of-the-art technology that foster policy reforms that promote further rationalization of the sector. To this effect, every privatization effort is unique in itself. The following are the lessons learned from the Abu experience:

**Strong political will**. The most significant driver of privatization in the Emirate of Abu Dhabi is the vision of the leader which is enshrined in Abu Dhabi Vision 2030. As demonstrated, the leader's vision is not a matter of rhetoric but a reflection of strong political will and commitment to developing the Emirate.

**Government support**. Privatization of the utilities sector in Abu Dhabi was able to attain its

goals because of the convergence of support from different government institutions. The transition from one stage to the other was smooth because of massive support provided by the government.

**Planning is the key**. Upon its announcement, the Crown Prince mobilized the proper authorities to come up with a long-term economic road for the Emirate that delivers upon the vision of the leader. Thereupon, Abu Dhabi Vision 2030 was formulated based on Policy Agenda 2007–2008 which among others provided for developing a partnership with the private sector.

**Setting appropriate privatization objectives**. The goals of privatization were dovetailed with the overall development goals to attain the vision of the Emirate. On the basis of the sector's goals, the appropriate objectives were set that considered the intent of the vision but defined in the context of the utilities sector. In this manner, the attainment of the objectives in the micro level will contribute to goal attainment at the macro level.

**Alignment**. One of the most significant factors in the privatization efforts of the utilities sector in Abu Dhabi is the alignment of policies and strategies, structures and functions, and processes and activities with the overall goals of privatization. This is the result of diligent planning and the creation of the proper authorities that oversee, regulate, and monitor both the preoperational and operational stages of privatization to ensure optimum alignment.

**Stable and transparent legal and regulatory framework**. For one, the success of privatization in Abu Dhabi is one account of a strong legal and regulatory framework. The laws enacted are strong and binding and are subject to constant review to keep it updated with global standards as evinced in the amendments introduced to the electricity and water laws. The mandates of the regulatory bodies likewise keep the balance of interest of the government and its private partners.

**Willingness to learn**. The road toward privatization in Abu Dhabi would not have been that smooth if not for the favorable attitude of the government to learn from the experts. Without a doubt, private consultants and foreign experts played a tremendous role in helping the government set the stage for privatization in the onset. This willingness to learn has paved the way for knowledge transfer which has significantly benefitted the sector.

**Favorable incentives**. Attracting international strategic investors is critical to achieving privatization objectives. As shown in the case of Abu Dhabi, the enthusiasm of private companies to invest in Abu Dhabi's utilities sector was not dampened by the economic downturn of 2008 and 2009. This is because of the stability of the Emirate and its capacity to provide favorable incentives to private investors.

**Risk management**. One contributory factor attracting private investment is the low-risk environment. As shown, the sound policies crafted by the sector, openness, transparency, accountability, and the regulation of private assets all contribute to attaining the privatization goals in the Emirate.

**Human capital development**. The benefit of privatization to the community through the nationalization program or Emiratization is a productive way of developing the nation's human capital. Emiratization is a part of the performance indicators of the Independent Water and Electricity Producers, and this has created the opportunity for high-value employment for UAE nationals. Part of the success of privatization in the Emirate is that it balances interests between private investors and the government without losing sight of the social agenda of providing the best employment opportunities to its citizens.

## Conclusions

The privatization of utilities in Abu Dhabi is one that is driven by political will. It all started with the vision of the leader, and everything else such as laws, regulatory frameworks, structural support, and financial mechanisms followed. This concept of a vision-driven privatization in rentier states under favorable conditions makes a worthwhile contribution to existing theoretical perspectives.

On the whole, the partial privatization of the utilities sector is robustly contributing to the realization of the leader's vision for the economic development of the Emirate. The series of legislation that culminated in the creation of Abu Dhabi Water and Electricity Authority and beyond institutionalized a framework for *enhancing the business environment through legislative reforms*. Privatization also opened the opportunity for Abu Dhabi Water and Electricity Authority to enter into joint ventures with world leading companies, thereby *enhancing the business climate to integrate Abu Dhabi in the global economy by attracting foreign investment and international partners*. All these are concrete indicators that privatization is contributing to economic diversification. Overall these reforms in the utilities sectors have not only shifted the government's function from "rowing" to "steering" but are edified milestones that see the leader's vision come to life.

## Definition

**Privatization**: transfer of public ownership of enterprise to the private. Relinquish mentor share of government functions with the private. Management of service delivery outfit by private entity. A governance situation that permits private control of the economy. Management reform targeted at dismantling public enterprise and establishment of private counterpart. Private participation in social service provisioning.

## Introduction

The purpose of government and governance everywhere in the world in human societies is to meet and provide for the basic needs of citizens, as well as to manage the collective affairs of society in a manner that enhances the welfare of the citizens and promote sustainable and progressive development in the state. The nature and practice of privatization policy, whether by (divestment, delegation, displacement, or decentralization) can determine citizens' satisfaction-dissatisfaction measurement as well as the type of market structure created, i.e., whether monopolistic or competitive structure. According to Sharma et al. (2012, p. 154), "privatization refers to transfer of ownership and management of country's economic activities from public sector to private sector." Privatization is primarily done to introduce effectiveness and efficiency, reduce government interference and administrative burdens, generate new investment, develop capital market and deepen the financial system, provide the opportunity to introduce competition, and enlarge individual choice and freedom.

Thus, in the context of this entry, privatization means deliberate attempt by government to induce competitiveness and efficiency in public institutions. However, this entry argues that government succeeds in creating monopolies through its privatization policies by neglecting the "competitiveness and citizens-choice" components in the stated policy objectives. It remains arguable whether there can be competition in a monopolistic situation. With the exception of the communication industries, it is not clear whether there are other government privatization policies which represent perfect market situation. The implication of these is the circumvention of consumer choice and monopolistic exploitation.

Interestingly, the survival of privatized service institutions hinges on the presence of competition and consumer participation as central elements in determining the level of service delivery citizens enjoy and the quality of services workers render in the organization. This holds simply that citizens have expectations on their government or state as compensation for recognizing its authority over them which is the bedrock for state emergence in the first place. However, the reality of government failings becomes antithetical to these ideas leading to dissonance. Applying this to the study of EEDC performance in Abakaliki, power utility consumers have experienced great conflict or psychological discomfort due to frequent power failures and their inability to do anything about the situation owing to the absence of customer appeal/justice system which would have promoted service atonement in the event of service failure (Rahman and Widiyanto 2015).

There has been a relentless search for most adequate service provisioning mode world over. In this process, several experiences and results have been recorded in different countries and settings. This also led to the glorification of one mode or condemnation of another. Scholars have also been tempted into advocating for one or some against one or some others. Not only that, the process has tasked the ingenuity of governments and scholars alike to go beyond the box. This had contributed to more invention or reformation of existing modes to suite the changing demands of our dynamic societies.

Privatization became an option when most revered governments of the world became champions and advocates of it. Also, many countries saw it as a dare option when it appeared that it

worked in those enviable societies. It was more attractive when this mode of service provisioning came with compelling promises especially when the existing mode appeared to had failed or at least worn out in the heart of the users.

The mode of service provisioning that was natural to the state was the public. This was the wife of the government betrothed to it at its inception to birth services for the people. This extension was central to defining the competence and responsive of the government to the people's needs. The total responsibility of service provisioning for the whole state as large as it may be is of course tasking and presents some challenges. The diverse results countries get in this mode has more often than not given them impetus to problematize the mode and opt for some change. This could be why other modes evolved to the service provisioning stage.

Privatization was a guest on the service provisioning stage. It came as an option to ameliorate the challenges of the public service. After decades of its experimentation, its undeclared characteristics came to light and many began to review their opinion of it. More so, it became more challenging when its promises could not be substantiated in the experiences many countries faced.

Against this background, this entry seeks to give a critical evaluation of privatization following diverse perspectives and angles. Also, we explore the processes and factors that determined its glorification. We also explore the various experiences of privatization and the impression it has made in both management system theory and practice, using the experiences of the customers of the Enugu Electricity Distribution Company (EEDC) in Abakaliki, Ebonyi State, Nigeria, as a case study. Then, we look at the future of social service delivery systems.

## Government Intervention and Resurgence of Privatization

It has become a normancy for governments of the world to initiate public service reforms, an attitude that was traceable to the British in the 1970s under the administration of Margaret Thatcher and that of Reagan in the United States showing a radical reduction in the way governments intervened in the process of service provisioning (Narayan and Singh 2014). This was a precursor to the erstwhile big government characterized by state intervention in the public life. The Second World War left a devastating impact on various states of the world. Rebuilding state and catering for the needs of the people aftermath of the war was highly needful. The situation of the states at this time was too fragile to be left in the hands of the private which were more concerned about profit rather than welfare. The war situation was even profitable for the privates as these saw it as opportunity to sell their wares at exorbitant prices. The activities of the private suppliers of weapons of war and materials created great impact that governments began at once to limit them immediately after the war.

Governments therefore took interventionist position in ordering state life and public service provisioning. This period saw the establishment of several public enterprises almost at all fronts of public life in most states of the world. Economic prosperity of this time also catalyzed the process and strengthened it. It had appeared to had started with the developed capitalist states down to the socialists and through to all other states irrespective of ideological leaning. Developing states were also found establishing and maintaining large public service outfits. These governments were seen to be running "big governments." Some period before the 1970s, these public outfits became a big burden to the state resources. It consumed large budgetary allocations and ran at deficits in its operations. Many of the enterprises accumulated large debts for the government. Then, these governments remembered that they could exhume the previously undermined mode of service provisioning, namely privatization as an alternative to this disappointing mode. This necessitated the rolling back of governments to enable the private to take over. The private was at this time preferred for a number of reasons. One, it would relief the governments of the large budgetary allocations. Two, it would offer alternative choice to the people who were limited by the previous option.

Three, it would make service provision more efficient and effective. Four, it would ensure greater public control and participation in their affairs. All these and more inspired and instigated the propagation of the privatization agenda even beyond the shores of the developed states to the developing and transiting states.

## Ideology and Privatization Campaign

Many scholars have alarmed that privatization is beyond a sincere service provisioning prescription but an ideologized emblem. It was argued to have stemmed from the liberalization ideology that aims to enthrone capitalism in every corner of governance in the world. It was seen as a new way of propagating capitalism and undermining every other alternative ideology. Farazmand (2002) has affirmed that privatization is a global campaign of capital ideology, and in all its forms and manifestations, the underlying motivation or ideology of privatization is "the supremacy of the market as an all-encompassing institution of the economy" (p. 357). The liberal ideology was an expansionist one that sort to enlarge spheres of material accumulation by the bourgeois class. The way to exploit the state to the full was to turn it into a market where there would be free and unbridled interaction between demand and supply. A market economy would permit scampering of the state by the privates that are set to maximize profit as the very motivating factor. This kind of economic arrangement would only permit the government a limited function. The government would serve as a speculator, a simple night Watchman and a passive participant in the state economy. This idea was bundled, packaged, and sold to the whole world especially at the time that socialism was already going into decline.

## Globalization

The propagators and advocates of privatization which were especially the developed world were the highest owners of multinational corporations. These companies felt the heat of the interventionist regimes that swept the whole world in the 1950s/1960s. These might have cried out to a heavy blow given to it as was even initiated by their own people. The developed state whether they were convinced about the relevance of privatization at the time around 1970s or not began to push for it. The world quickly forgot the impact of the activities of the private enterprises prior to government intervention aftermath the World War II. The vehicle for the propagation of capitalist ideology of privatization was globalization.

Globalization is the erosion of world state's boundary at several fronts of, but not limited to politics, economics, culture, and ideology. It was signified by the integration of all states of the world into a single global market. The design of globalization was overwhelming and overarching. It swept through and overtook all segments of public life and arrangements. It was an attempt at unification and homogenization of the socio-economic life of all people around the world.

Particularly, the economic design was aimed at integrating all states into a uniform global market for equal interaction. This design was suspicious and unfair for several reasons. The states of the world are both natural and by circumstance unequal in economic strength and power. The merging of these economies to interact on equal basis was not simple as it sounded. Some economies dominated others and of course interactions of states were unequal due to their differential capabilities. Developing states and some other weaker states were at the loss end of this economic arrangement. The integration of all states into this economic sphere meant that these were going to be bound by common rules of the game. Yes, the states were to dismantle every economic barrier for free economic interactions.

This aspect of free trade and less barriers to economic interactions across state borders necessitated or permitted the rooting of transnational corporations in many economies. Obviously, the very mode of service delivery that could permit this adequately was privatization. Globalization was targeted as ensuring that states of the world opened their borders for scampering by multinationals. This was an imperialistic tendency of

capitalism to deepen its ideology in every corner of the world. Service provisioning by multinationals will in every sense not be motivated by the ordinance of social service provisioning but by cardinals of profit maximization. Nevertheless, the grand purpose of demand for change of service provisioning mode by the people is adequate social service delivery that must be affordable in everyway more than the former arrangement. Also, it was to expand avenue for choice, adequate response to demand, and social service security.

## Management System Revolution

Another interesting way of looking at impetus for privatization was to look at some nuances in the management transitions, reforms, and revolutions. The world management system has been revolving and transforming. We could say that the management system of the world is in a constant but slow and punctuated motion. The post World War II 1950–1970s that saw big economic boom was characterized by proliferation of public service outfits and greater commitment to public service provisioning (Puolokainen and Jaansoo 2018). Service provision was centralized and the bureaucracy was to render efficient service neutrally (Ukeje et al. 2020). This period also saw dichotomy between politics and administration. The nomenclature with which this arrangement was captured by the Public Administration scholars was Old Public Administration (OPA).

This era was quickly followed by another arrangement known as New Public Management (NPM). It was an attempt to revolutionize the existing management system to have a market-oriented structure that leverages on decentralized operations embracing public-private collaboration for effective and efficient service delivery (Marshall and Abresch 2016). This was more or less necessitated by the economic meltdown in the 1970s. There was need to cede government functions to the private enterprises to reduce both fiscal and management burdens on the state. The first move in this direction was recorded in United Kingdom under the administration of Thatcher (Puolokainen and Jaansoo 2018). The era was justified by a number of criticisms leveled against the OPA as outdated service provisioning mode. This management system has as its underlining idea the priorities of privatization as had been identified.

As aptly pointed out by Puolokainen and Jaansoo (2018), when NPM came of age, its promises began to fade and its weaknesses became apparent. It became needful to evolve new management system as responsible governments to meet the needs of social service provision. This development has triggered quest for a new management system. The development that ensued resulted to the emergence of the so-called governance era characterized by dynamic effort to social service provisioning.

## Why Privatization?

Understanding the reason privatization has become global priority has tasked ingenuity of scholars and state men alike. Could there be homogeneous perspective on the imperatives of privatization? Is there any explanation that supersedes another? Is there any reliable explanation to the nuances of privatization theory and practice? Clifton et al. (2006) took the challenge to explore perspectives on the reasons why governments privatized. Accordingly, they developed or divided the privatization literature into three paradigms, namely, the British paradigm, multiple logic approach, and the European paradigm as explanatory framework for the imperative of privatization in Britain, European Union, and how this has implication for the global experiences.

The authors raised yet to be resolved questions that centers around the way analysts share privatization excitements especially as it relates to the financial success which they assume as fast and uniform while neglecting how disjointed and complex it actually is in many places. Another concern is that there is also neglection of social implications of privatization while focusing on the financial aspect of it. Lastly, whereas it is agreed that privatization made-up policy option of many countries especially in the twentieth

century, there is little or no agreement on the motivation behind it. It was against this backdrop that the authors sought to identify the motivating factor(s) that underscored privatization especially in the European Union.

With respect to the British paradigm, privatization was pegged on the experiences of the British. It was a function of British ideological preference for "market solutions," ownership by individuals and state intervention distaste (Clifton et al. 2006). This was linked with the right-wing ideological imperatives of Margaret Thatcher. The proponents of the paradigm insist that for inclusion into the global market economy, countries have to subscribe to the privatization logics. There is belief that privatization is a "single, homogeneous process that can be implemented in diverse countries and yet have the same kind of results" (Clifton et al. 2006, p 738). One of the impetus for the paradigm's emergence was that scholars at this period where more often than not influenced by the experiences especially of the British. They had strong belief in the idea of private ownership stressing that the tendency of profit maximization would result in efficiency and adequate service provisioning while neglecting strengthening competition, reregulation, and public service obligations. These British imperatives are still being paraded by the contemporary World Bank and International Monitoring Fund (IMF) as policy prescription warning against falling to the deadly ailment of public ownership (Shirley 1999 cited in Clifton et al. 2006).

However, towards the end of 1980s, comparative works that examine the privatization experience across countries showed different results. The linearity of the British paradigm was exposed and was been rejected by many scholars. It was even noted that British cannot be seen as a leader of the privatization but rather an abnormality. It was noted that the rationale behind privatization was not single but variegated. There were several experiences by several countries that necessitated the policy reform. The British was further accused that its tendencies could be termed as "market fundamentalism" (Stiglitz 2002 cited in Clifton et al. 2006) showing her insincerity in the first place. This was evidenced by the fact that examination of the results of privatization beyond financial terms became troublesome.

The third paradigm known as the European paradigm was concerned with what has impetus for privatization in the European Union (EU). Could the British experience be the same reason for this policy priority? It was noted that beyond other factors, the technological shift, economic crisis, and interconnectedness of the society were central to the privatization and deregulation reforms in the EU. This paradigm explains the regulatory roles that these governments undertook to correct trending anomalies in this sphere. It could be seen as reactive and responsive measure to the fallouts of the globalization and governance crisis. These three paradigms explained above have implications or at least shades some lights on the experiences of the rest of the world and may proffer explanatory framework for the experiences.

## Theoretical Framework

This entry is predicated on the Public Choice theory as propounded by Buchanan, James and Gordon Tullock, (1962). The Public Choice theory focuses on the action of both elected and appointed government officials, their self interest, and the nature of their relations with various client groups. In essence, the theory seeks to analyze the actions and behavior of an individual as a rational, discriminating selector who aims at maximizing utility (Munck 2002). The basic assumptions are as follows: Firstly, individuals act in their self-interest and not in the interests of others. They are considered rational, calculating choosers who seek to maximize their own utility. Political actors who make choice in the world of scarce resource are influenced by each other, foreign officials, unions, and others who have direct or indirect stake in public policies.

Hence in every organization, policies are made in favor of major economic actors and government agents. Since the major interest of a rational economic man is profit, he acts to continue endlessly in capital accumulation process. Secondly, individuals have enough information about how

to make the maximal use of their preferences. These preferences come from outside and are not the consequences of social, cultural, or historical influences. Finally, the preferences are transitive (Mueller 2003). Accordingly, research findings reveal that the EEDC fear of contract review/withdrawal and lack of job security after the probation period (2014–2018) due to change of government has forced them to make rational choices such as cost minimization strategies to protect their interest. The political market is made up of those who demand certain type of public policies and those who supply them. These actors are self-interested. They are motivated to better off themselves. Since every self-motivated official would like to be reelected or reappointed, the interests of the actors and the resource they command determine the policy made and implemented in any environment (Balaam and Veseth 2005).

From the findings and observation, customers of EEDC have added "self-pacifist cognition" to tolerate power failures rather than confront them. Hence, customer expectation is set at default to expect and tolerate service failure and a resort to petrol powered engines as standby power supply sources. Service failure normally leads to negative reaction from customers of service institutions. Ideally, when it persists, should lead to customer switching. However, it does appear there are little or no such experiences in the study area.

This holds simply that citizens have expectations on their government or state as compensation for recognizing its authority over them which is the bedrock for state emergence in the first place. However, the reality of government failings becomes antithetical to these ideas leading to dissonance. The implications and or purpose of dissonance resolution is that in a perfect competitive market, consumers are said to be kings; deciding on what is produced and supplied (though indirectly) through consumer choice mechanism. This phenomenon keeps producers and distributors on their toes for efficiency and effectiveness to be achieved so as to satisfy customers demands which is the sole criterion for a producer's or distributor's survival in the perfect market. It can be used to engender healthy competition in addition to enhancing investments. In this vein, the public choice theory are used to explain the games of interest preservation and propagation as evidenced by EEDC and staff's contract intelligence as well as consumers withdrawal from the service process respectively. Applying this to the study of EEDC performance in Abakaliki, power utility consumers have experienced great conflict or psychological discomfort due to frequent power failures and their inability to do anything about the situation owing to the absence of customer appeal/justice system which would have promoted timely and effective service delivery in the system.

## Lessons Learnt: Customers Quality Service Delivery and Development Issues in the Ebonyi State Power System

No doubt, electricity is a major source of power, a critical infrastructure that is strategic to a nation's socioeconomic development (Idowu et al. 2020). However, lessons from the experiences of the customers (citizens) and some selected members of Electricity Committee in Ohatekwe, Agalegu community on the nature and level of power service delivery in Ebonyi State, Nigeria, revealed that factors such as fear of contract review/withdrawal and lack of job security after the probation period (2014–2018) due to change of government affect the performance of electricity supply by the EEDC in Abakaliki. Also, monopoly and customers self-pacifist behavior were found to account for the persistence of the identified challenges in the sector. Findings further revealed that beating, harassment of EEDC staff, and vandalization of power infrastructures by customers (citizens) due to service failure or as expression of frustration results in constant high bill estimation since staff cannot freely move to pick accurate meter readings in some premises where they had been confronted regularly. These results into constant light interruption, over voltage, load shedding, bulk billing, disconnections, and delay in new connection.

Notably, the same epileptic power supply currently experienced in Nigeria prompted most countries in the world like the governments of

India, China, Mexico, and South America in general to hand over the entire management of electricity generation to the hands of private investors in which has led to a wonderful performance in the industry (Awosope 2014), but in Nigeria, the impact of such reforms is yet to be felt almost 6 years after the program. The entry posits that for the attainment of the current Sustainable Development Goals (SDGs) goal 7, which aims to ensure access to affordable, reliable, sustainable, and modern energy for all by 2030, Public Enterprises (PEs) should invest more in recruiting more qualified staff and improving their condition of service; while government institutionalize the contract concessioning activities to remove it from political influence, at least partially and finally, make clear its policy responsibility to assign clear areas of intervention between it and the company and invest robustly in infrastructure (Ukeje 2017).

Importantly, the SDGs targets cannot be achieved without careful consideration of the role of energy (Edomah et al. 2017). Nigeria as the largest economy and most populous state in the entire continent of Africa (Offu et al. 2018) is greatly challenged with the problem of reliable power supply (Ighodalo 2018). The provision of adequate, affordable, accessible, and sustainable electricity supply is critical to the attainment of sustainable development (Akinbami and Momodu 2012). However, public service delivery in Nigeria has witnessed declining performance levels since colonial administrative period (Ukeje et al. 2019). According to Kauzya (2015), the effective delivery of public services which includes energy is generally taken as a key function of government and a critical element in the implementation of 2030 Agenda for sustainable development and achieving the SDGs, mediated by sound governance indices and public administration through a strong partnership building (Farazmand 2009) in the delivery process. Sound governance requires adaptability, capacity building and development, innovations in policy and management, and a sound administrative system that is dynamic, flexible, diverse in character, and solid in structure and value orientations (Farazmand 2004) in both political and administrative settings that centers on citizens engagement (Farazmand 2012, 2017). Service delivery is the center of all activities of public-private sector organizations because government is constituted to serve the people and ensure public good. Sound administrative-governance in public service delivery is measured by the quality and quantity of those citizen-centric and people-driven services rendered since the SDGs need an effective public service for successful implementation (Ukeje et al. 2020).

The nature and practice of privatization policy, either by contracting out, outsourcing, or complete privatization through various schemes, "grounded on the idea of the supremacy of the market as an all-encompassing institution for a functioning society as well as the most viable and functioning institution in the economy" (Farazmand 2002), can determine citizens' satisfaction-dissatisfaction measurement as well as the type of market structure created (either monopolistic or competitive structure). Privatization is primarily done to introduce effectiveness and efficiency, reduce government interference and administrative burdens, generate new investment, develop capital market and deepen the financial system, provide the opportunity to introduce competition, and enlarge individual choice and freedom. Privatization must result in better service at lower prices as desired by consumers who oftentimes are not much bothered about economic philosophies (Adeyemo and Salami 2008).

Thus, in the context of this entry, privatization means deliberate attempt by government to induce competitiveness and efficiency in public institutions through the new public management (NPM) and the new public governance (NPG) paradigm. However, based on the Ebonyi State experience, this entry argues that the government of Nigeria has only succeeded in creating another layer of powerful unaccountable monopolies through its privatization policies by neglecting the "competitiveness and citizens-choice" components in the stated policy objectives, often as government is unable to deal with the politico-economic intervening components of the reform process. It remains arguable whether there can be competition in a monopolistic situation. For

example, the poor service situation in the communication industry and the manner they deal with cases of reported service failure demonstrates clearly the audacity of secure business interest ostensibly due to "market conquest." It is not clear whether there are other government privatization policies which represent fair competitive market situation in keeping with the true spirit of privatization. The implication of these is the circumvention of consumer choice and monopolistic exploitation.

Thus, on these stated problematic underpinned, former president Chief Olusegun Obasanjo, in the year 2003, constituted a committee of experts headed by Wendy Thomas to help Nigeria do a diagnostic audit of the system, examine institutional environment for service delivery, reflect on people's lives and experiences, and draw a road map for a service delivery program. The service delivery program should:

- Create "citizens" and "customers" demand.
- Instill higher expectations of public services.
- Communicate service entitlements and rights.
- Publish information about performance.
- Redesign the services around customer requirements.
- Success of the program will require committed leadership from the top.
- Government should demonstrate leadership commitment with a public declaration about service delivery.

The extent this noble goals have been achieved is only a matter of debate between practitioners who see "great leaps in public service reforms since 1999 and scholars who see little progress and largely business as usual efforts lacking the needed impetus to perform". Effective performance of public services is underpinned by certain core values, which include integrity, meritocracy, discipline, professionalism, patriotism, and impartiality (Idike et al. 2019).

The privatization of the power sector in Nigeria has suffered setbacks due to lack of good maintenance culture which has resulted in a number of situations whereby the industry has remained unviable to investors (Oluseyi et al. 2007) and lack of regular training, the human factor accounts for a great deal of then power sector's current debilitating condition (Awosope 2003; Abubakar 2011). This is aggravated by unavailability of specialized engineers and technicians for certain tasks as well as unpreparedness of the industry to pay equitable amount as hazard allowance and insurance policy attached to the workers. Government at all times should be prepared to demonstrate the political will to enforce as well as implement policy reforms (Ukeje et al. 2020). Absence of alternatives or competition (substitutes) is responsible for customer incapacitation and non-responsiveness of EEDC in respect to service atonement and service appeals. It might be helpful for both government and EEDC to explore the SDGs targets of 7a and 7b to widen resource dragnet for improved investments in the sector while leveraging the "Third Sector" structure to engender a resilient administrative mix. This may provide the needed incentive for performance optimization in the EEDC framework.

As yet, the third sector partnership option remains largely unexplored and its potential to improving service outcomes in the Nigeria energy sector yet untapped. It is argued that involvement of the already existing Electricity Committee Framework as a statutory management layer will help mobilize resources for investment, secure power infrastructure, and broad supervising oversights on EEDC staff operations and ensure customers (citizens) satisfaction. This means that the destiny of the state or nation and its public sector is tied and overthrown if service is not rendered effectively and efficiently. PEs should be politically neutral, impartial, loyal, transparent, accountable, and of high integrity with participatory leadership style if effective service delivery is to be achieved (Obiwuru et al. 2011; Ukeje et al. 2015).

## Implications and Explanation for the Developing State Experiences

Most developing countries were formerly under the colonial influences of advanced European and American societies. Many of these countries

weaned from the political dominance of the Western or Northern Metropole around the 1950s and 1960s of the post WW II. As these countries were under the administration of their colonial heads, their political and economic policy imperatives were in fact implemented in their countries with little or no knowledge of the implications. In most cases, they see these policy options as natural and sincere for their development. After they weaned from the colonial rulership, they still continued to implement the policy prescriptions of the former colonizers as it appeared safer than the unknown others. The developed societies ensured that these countries followed their prescriptions by using it as the only way for the developing countries to receive aid from the international donors. This explanation shows why implementation of privatization policy was successful in many countries, a thing that triggered questions as to what was the incentive for the huge acceptance of the privatization idea even without prior experimentation on the authenticity of the relevance. Some have noted that this acceptance was instigated by pressure (Bazilian et al. 2012), deception, and not a product of policy intelligence. The idea of privatization influenced naive idealists and optimists to accepting market as the final alternative force for society running and economic institutions governing (Farazmand 2002).

The British paradigm explanations are significant to understanding this process in the developing societies. Many developing countries were under the colonial influence of the British prior to the 1960s. Many of these still maintained strong alliance with the British even after their political independence. The strong relationship lends credence to why privatization was accepted hook, line, and sinker in these countries. By implications, the acceptance of this service provisioning mode in this sphere was not due to its benevolence but a product of ideological deception and political manipulation. The developing societies were made to believe that their economy would transform automatically to the form of that of the developed states just by following this policy prescription. These countries tolled the prescribed line of reform and eventually got heart breaking results. They lost their economy to multinational corporations showing they lost to the imperialists. Also they became enemies to their own citizens who saw that the lack of adequate supply of social service was a deliberate one by their states. The states became confused as to which option to fall back to or how to solve their problems.

The experiences of the developing societies show like the multiple logic approach has explained that there are different reasons that should inform adopt of privatization reforms and not just a policy fantasy patterned in line with global policy transition trends. Developing countries each have individual and peculiar challenge that could necessitate some policy options. It was not even necessary that this option must be uniform as the case with privatization. Prescribing uniform policy options for diverse countries at various levels of economic growth and possessing peculiar challenges should have sent a strong signal that it was insincere. It could have shown that if the pressure was coming from a particular angle that it could have meant a uniform issue from the angle requiring collective action to ameliorate. Perhaps, the reason for the propagation of the policy option would not have been for solving the problem of the targets but of that of the propagators. Internal countries' logics should have been a determining factor for policy option suitable to addressing their challenge rather than foreign prescriptions freely offered even when it was not requested for.

Finally, the European paradigm offers significant insight into what is really needful to addressing countries' internal logics. Whereas this offers reactive measures to rising challenges in each country, we suggest a combination of both proactive and reactive measures. Proactive measures is necessary to arresting possible future challenges while reactive measures may serve as a correction of the mistake or unforeseen occurrence in the system.

## Conclusion

With critical examination of the notions and perspectives held about privatization coupled with cross country experiences, we are constrained to

tender unbiased observations. Privatization is nothing but an ideological prescription to instigate market superiority in all aspect of socioeconomic life. It could be termed as unbridled quest for excess gain instigated by the bourgeois class and implemented by their political allies. There is a disjuncture between profit maximization and social service provisioning and satisfaction. Therefore, privatization question is not a social service provisioning but a financial prosperity question. This does not deny the areas of the state which privatization has worked fine like, for example, the telecommunication industry. It is important to clear the point that the major aim of the private enterprises is not social welfare but profit. This is not also to certify that public ownership of social service outfits is the ultimate. Both have evidently failed in many countries with few good reports. We subscribe to the idea of strong institution and competent regulation by governments to be able to order social service provisioning (Ukeje et al. 2019). Any service provisioning mode could be fine if supported by relevant and adequate institutional logics and pragmatic leadership.

In view of the research findings and taking into consideration the overall performance of EEDC, it is quite reasonable to conclude that EEDC lacks the institutional capacity and capability to deliver quality and satisfactory services to the public such as under staffing and use of inexperienced staff in order to minimize cost and maximize profit, inabilities to provide adequate transformers in the various service areas/zones, and thus jeopardizing the goal of achieving quality, reliable, and sustainable power supply in the state. This is aggravated by unavailability of specialized engineers and technicians for certain tasks as well as unpreparedness of the industry to pay equitable amount as hazard allowance and insurance policy attached to the workers. Furthermore, government has not also faithfully implemented the competitiveness component of the privatization program leading to the emergence of new monopolies. Absence of alternatives or competition (substitutes) is responsible for customer incapacitation and non-responsiveness of EEDC in respect to service atonement and service appeals. Customers of EEDC also showed reflections of dissonance from the expectations of the privatization of the power sector by the Nigerian government which was expected to improve power supply.

Customer dissonance can be resolved in two basic ways: firstly, adding to the cognition to tolerate or justify the frustration. For example, customers of EEDC perceive power failure to be a normal situation which defies remedy and so condition their minds to accept power outages by default. Being by expectation, it really does not worry anyone when it happens. This is the self-pacifists method. Secondly, by avoiding social situations that exasperates dissonance like resorting to alternatives to EEDC supplies such as personal power generating sets even at high costs.

Availability of power is a sine-qua-non for the much desired industrialization in Nigeria. Problem however remains how to improve the institutional capacity of the EEDC and conserve both power and power infrastructure. In this line of thought, the Nigerian Electricity Regulatory Commission (NERC) should be reconstituted to give the required institutional support to ensure a balanced regulatory framework to protect both investors and consumers; finally, the Transmission Company of Nigeria (TCN) should be reorganized into technically, financially, and commercially viable and market-driven company. This will help to achieve increased access to electricity services, improved efficiency, affordability, reliability, and quality of service and greater investment in the sector to stimulate competitiveness, economic growth, and development in the state. Lastly, EEDC as a private company should improve upon its public relations strategies such as fair and timely service atonement, frequent consumer orientation/information through advertorial, stakeholders' engagements, etc. This is intended to change consumers' attitudes which lead to power wastages.

This entry has shown that traces of inefficiency, poor service delivery, injustices, ethical violations, and low performance in EEDC pose serious challenge to the tenets of privatization in Nigerian governance and underscores the need to reengineer a service rebirth. The poor service

challenges are characterized by difficult sometimes confusing payment procedures not clearly displayed; customers do not see EEDC as an efficient organization; EEDC staff don't offer explanation for delays; hidden charges (bills) for services rendered; inadequate records and management of complaints resulting in customers' dissatisfaction and conflict. Thus, removing the challenges of poor power supply and inefficiencies in the sector will enhance the realization of the objectives of the current Sustainable Development Goal 7 by 2030 by providing access to affordable, reliable, sustainable, and modern energy for all.

# Process Innovation in Public Sector

Ali Khodadad-Saryazdi
IRGO (Institut de Recherche en Gestion des Organisations), University of Bordeaux, Bordeaux, France

## Synonyms

Administrative innovation; Organizational change; Organizational innovation; Organizational technology; Technological innovation; Technology implementation

## Definition

Process innovation is the realization of work activity in a new way, in other words, it is a radical process change initiative (Davenport 1993) that may be due to political, organizational, or resource constraints. Process innovation integrates technological and organizational changes and may result from the advent of new technology in an organization. The implementation of process innovation requires the change and transformation of business processes, equipment, and work habits. This innovation may require the readjustment of administrative, manufacturing, or managerial processes. Process innovation is an outstanding issue in the public sector, but, till now, little attention is paid to its implementation challenges in this sector.

## Introduction

Adoption of innovation results from the innovation diffusion and marks the starting point of the implementation process. Nevertheless, an innovation adopted by an organization or some of its members does not necessarily lead to implementation or a successful implementation. Even though the adoption studies can anticipate the innovation absorption

capacity, it would be in the implementation phase where the challenges of process change reveal themselves.

The majority of public organizations challenge social requirements, multiple user exigencies, and resource constraints. The reorganization of services, development of synergies, or the introduction of new technologies that disrupt the operators' routines reflect these challenges.

The high performance of the private sector due to the entry of multiple tools has led to the importation of private-sector techniques into the public sector. Over the last few years, new technologies have gradually entered in all activities and induced the need to transform production processes of public services. The interconnection of this transformation with ongoing technologies can offer significant benefits to the public sector and improve the added value of activities. However, despite the reform of the New Public Management, which seeks to make the government more business-like (Hood 1998), the peculiarity of the public sector and its mode of governance require adapting the management of process innovation implementation.

There are several works about the success factors of process change in the private sector, but there is little explanation of how the public sector specificities can influence its implementation. In this work, process innovation implementation is highlighted under the public sectors' restrictions and traits. The objective is to provide a general framework for the implementation of any process innovation type in the public sector. Several proposals are presented in the end. Taking these proposals into account by managers before implementing a technology-based innovation will aid increase the implementation success. The proposals can also be used by researchers to conduct field research.

## Process Innovation: From Adoption to Implementation

Process innovation is the most widespread innovation in the public sector because of two major convergent movements, new public management (NPM) and e-government (De Vries et al. 2016). However, public organizations are rather adopters and not innovators (Djellal et al. 2013). Moreover, because of the functioning of the public sector, innovations are often introduced in a top-down process, which raises the question of how to implement innovation more acutely.

### At the Origin of the Implementation: The Adoption of Innovation

Adoption as a decision to implement does not guarantee effective implementation or application. This decision separates the phase of initiation, also called preadoption, from that of implementation, also called postadoption (Damanpour and Schneider 2009). Several sequential models represent the innovation process, but in fact, it seems too complex to separate the stages. Indeed, process innovation is a recommended technique, philosophy, or series of activities that can be implemented in different ways without a unique rule but requires context knowledge.

In increasingly competitive situations, process innovation can significantly impact productivity and help to gain a competitive advantage by improving organizational efficiency and responsiveness. As examples of process innovation in the public sector, we can mention the e-government (Mensah 2020), Smart Port technologies (Rajabi et al. 2018), the one-stop-shops, e-learning, telemedicine (Khodadad-Saryazdi 2019), the enterprise resource planning system, or the cargo community systems (Baron and Khodadad-Saryazdi 2021).

## Implementation of Process Innovation in Public Organizations

Adoption and implementation are the challenges related to the introduction of innovation in any organization. The success of the implementation phase does not obey a single rule, so its comprehension requires a thorough knowledge of the specificities and characteristics of the public sphere.

### Public Sphere

Process innovation in the public sector is often associated with reform movements, such as new public management (De Vries et al. 2016; Pollitt and Bouckaert 2004) that contributes to legitimize public organizations. Seeking increased performance leads to the introduction of new tools or changes in business practices. Innovation in the public sector is mainly driven by governance improvement and service performance, all for creating public value. Process innovation can both improve the services provided to users and simplify administrative processes (De Vries et al. 2016). However, the initiative to implement process innovation can not only raise the legitimacy of public bodies but also lead to a loss of legitimacy by revealing the gaps or conflicts in the implementation.

The public sector is the collection of organizations, agents, and activities subject to the political system, collective purpose, and strict rules (Ouellet 1994). These criteria indicate the importance of the government's role and its influence on innovation implementation.

The social utility of public organizations can be at the origin of public innovation policies. However, today's degrading image of public service is not irrelevant to the subject. Limiting public bodies' resources influencing the service quality, and introducing the competition, incite the desire to regain. Therefore, innovation can be one of the strategic decision orientations of public organizations. Moreover, public agents have certain rights and obligations. The fact that they work in a strictly regulated environment and are regularized to their position can sometimes affect their work culture vis-à-vis the process change. Culture, not irrelative to public servants' social ideology, can facilitate or complicate process innovation's implementation.

### Public Context Characteristics

Public and private organizations are similar in many respects but differ fundamentally that can be explained by Core Publicness (Rainey et al. 1976). The basis of this approach is the division between political authority and market incentives, generally used to identify the differences between public and private sectors and examine the possibility of applying certain techniques of private enterprises in public organizations (Rainey and Chun 2007). These differences also have an impact on the organizational posture toward innovations (Koch and Hauknes 2005).

Political and economic authority can affect organizational strategy. The public sector is mainly known for the specific legal status, budget dependence, and nonprofit vocation to ensure the missions of general interest, that can encourage public directors to engage in producing goods and services without seeking profits or incentives (Rainey and Chun 2007). Public directors, as well as many public professionals, do not have enough time to think about doing things differently, because they devote a substantial part of their time to responding to political bodies and reporting to the inspection agencies or political leaders (Mulgan and Albury 2003). They are under the permanent control of public authorities, which restrains their activities' liberty. Moreover, complex administrative formalities and long process requests make it complicated to achieve new technologies. These latter are considered the process change enablers, and their absence may inhibit innovation (Koch and Hauknes 2005).

All these restrictions, obligations, and potential risks can increase the hesitation of public organizations in implementing a complex innovation. The public values and objectives can also affect innovation implementation. For instance, some public bodies, like the military, have a rigid structure with a dominant heritage culture, in which the change is considered as a disruption in the organization's functioning, and thus it is preferable to keep intact the processes that function properly (Koch and Hauknes 2005).

Public agents have a reduced motivation to improve performance, but they prioritize organizational commitment and public values (Bullock et al. 2015). Limited motivation plans and financial incentives, as well as budget dependence of public institutions, can decrease organizational performance.

Lack of resources, such as relevant skills, financial resources, and support from other departments, can preclude adoption (Djellal et al.

2013). Nevertheless, these shortages can also obstruct the implementation due to resource underestimation or weak intercommunication. For instance, in some public structures such as public hospitals, the large size and lack of communication between the different departments can complicate the implementation (Koch and Hauknes 2005).

The impact of this compartmentalization is even more evident in public hospitals where the medical and administrative staff do not always have the same priorities in terms of innovation, which can lead to a lack of support, resistance to change, and a decline in organizational learning.

## Factors Impacting Process Innovation Implementation in the Public Sector

The potential situation of process innovation implementation in the public sector has been investigated by the existing intersection between publicness and the implementation success factors. The intersection gave rise to nine proposals that can be validated by future investigations (Table 1).

### Strategic Alignment

It is the linkage of organizational priorities and processes to achieve business goals (De Bruin and Rosemann 2006). The disjunction between process and strategy can be one of the major failure reasons of the process change projects, but when the processes are aligned with the public organization's strategy, it facilitates the change.

The force field in public bodies emanates from government policies with a normative framework on their functioning. If the financial objectives and profit logic encourage private organizations to develop or use innovation, in public ones, the force field and social interest can migrate the strategy toward the implementation of an innovation deemed useful. In the same way, a risky innovation project can be judged as a loss of public funds. Risk aversion in the public sector can be explained by the fear of inadequate consumption of public resources (Koch and Hauknes 2005; Mulgan and Albury 2003). Therefore, process innovation must be closely linked to the strategy to be accepted.

Given that in the public sector, strategic alignment is particularly influenced by political objectives, laws, and people's well-being, a process innovation may be admitted with more interest if its advantages concern both the State and the users. So, we can say that:

**Proposal 1.** The conformity of process innovation with the policy and laws of society may favor its implementation.

Lack of incentive can reduce motivation toward innovation (Mulgan and Albury 2003). Similarly, if the innovation does not benefit the public organization and agents, it may never become a part of organizational strategic priorities, and even after a period, it can be stopped partly or entirely.

**Process Innovation in Public Sector, Table 1** **Matrix of proposals**, The interaction of public sector's traits with process innovation success factors

| Implementation success factors<br>Public characteristics | Strategic alignment | Governance | Leadership | Culture | IT/IS | PA | PE |
|---|---|---|---|---|---|---|---|
| State's high influence | | | | P5 | | | |
| Lack of resources/budget dependence | | | | | P6 | | |
| Strict rules/regulated environment/complex and long administrative formalities | | P3 | | | | | P9 |
| Public values and objectives | P1/P2 | | | P5 | | P8 | |
| Limited financial incentives/reduced motivation | | | | | | P8 | |
| Limited power, limited autonomy, and more frequent changes of public directors | | | P4 | | | P7 | |
| Risk aversion | P1/P2 | | | P5 | | | P9 |
| Compartmentalization | | | | | P6 | | |

In the public context, there are different stakeholders such as State, public organization, public agents, and users, and their benefits during the process change should not be neglected. Therefore, process innovation must bring advantages for public managers and agents to support its implementation, so:

**Proposal 2.** The more process innovation is adapted to the requirements of the public body and its agents, the easier would be the implementation.

If the alignment of new processes with the organizational strategy contributes to implementation, reciprocally, the organizational strategy can also support the implementation of new processes. In this context, management can provide a helpful context and support all the necessary dimensions of implementation.

### Governance

It refers to the management of the process change project and that of process execution. Project governance enables the accomplishment of activities in the given time and minimizing the project problems, but not enough because the effective daily functioning of new processes requires process governance. Therefore, when new processes are implemented, a management system is essential to make them viable, by the creation of structures, performance measurement tools, as well as transparent and appropriate roles and responsibilities (Rosemann and vom Brocke 2015; Spanyi 2015).

The process change initiative in the public sector requires a detailed project management plan with specific steps and objectives. The development and validation of the project, as well as the provision of resources, sometimes can be very time-consuming due to the rigid structure of the public sector. Furthermore, the fact that public bodies are dependent on the annual budget forces them to prepare a rational economic plan in the short term. Short-termism can hinder significant organizational change because this later usually requires long-term planning (Mulgan and Albury 2003).

Therefore, the strict rules of the public sector may make the implementation more complex. In fact, at the organizational level, public bodies are more or less bureaucratic, and decision-making needs more paperwork. Moreover, the role of public authorities in the management of the public services is accentuated by the central or local administrations, as part of activity control and supervision; consequently, we can say that:

**Proposal 3.** The administrative procedures and burden can complicate the implementation of process innovation.

### Leadership

Leadership concerns the manager's support throughout the process change. According to Damanpour and Schneider (2009), leadership in public organizations can create a social climate encouraging staff motivation. The director can also provide necessary resources and coordinate projects. The role of leadership would be even more significant if the project is raised in a bottom-up manner. In the public sector, the frequent change of senior managers can influence the implementation of projects (Rainey et al. 1976). The arrival of a new director can have a significant impact on the popularity of process change, even if the official strategy remains the same (Rosemann and vom Brocke 2015) because each director has his own reasoning. So:

**Proposal 4:** Frequent change of public managers can impact the implementation of process innovation.

### Culture

Because of the specific culture and legal status, business process change in a public organization can be more complex than in a private one. Moreover, in the public sector, reforms can affect the implementation of process innovation. As Pollitt and Bouckaert (2004) point out, the reform consists of deliberate changes in structures and processes of public sector organizations to get them to run better. Process changes can encourage public agents to be more performance aware. According to the recent research of Mensah

(2020), the ability of governments to provide the required regulatory framework and other related policy issues can be useful and even crucial for the implementation of e-government services.

Regardless of the nature of the public sector, the reforms can influence organizational culture by reducing resistance and encouraging public agents to cooperate in implementing the process innovation. Reforms can also, sometimes, clarify and simplify the legal requirements of implementation, and so decrease the risks of the process innovation.

**Proposal 5.** Reforms can act as an enabler in implementing process innovations.

### Information Technologies (IT) and Information Systems (IS)

Some process innovations in the public sector are highly IT-dependent, and their utilization can bring significant benefits to organizational processes. For example, e-government is one of the IT applications to automate business processes and to create integrated IT infrastructures, or telemedicine which is one of the IT applications in the healthcare sector aimed at improving patients' access to care by modifying traditional medical processes (Khodadad-Saryazdi 2016). Thus, IT can both facilitate process modification and the implementation of process innovation.

Integrated Information Systems (IIS) can contribute to decompartmentalize different units of the public institution, facilitate the creation of integrated processes, and add value to the organizational processes. However, many process innovations are dependent on Integrated Information Technologies (IIT) or IIS or both. The reality of resource and skill shortage in the public sector is not irrelevant to the implementation of IT-dependent or IIS-dependent process innovations. The provision of performant IT equipment requires the budget allocation and the competence for IS interconnection. So, we can say:

**Proposal 6.** The fact that IT implementation within process innovation requires specific and extraresources can complicate or delay its implementation.

### Process Actors (PA)

Actors who are directly or indirectly involved in process change are the most valuable asset of an organization for process improvement or innovation (Willaert et al. 2007) in terms of knowledge, competence, commitment, motivation, and loyalty. The essential actors for implementing process innovation are the director and his team, the personnel concerned by new processes, and the project champion.

In the public sector, the implementation of an innovation is often realized in a top-down logic. However, the limited power, restricted autonomy, and more frequent changes of the public directors (Rainey et al. 1976) may lead to a movement by agents to lead a process change. This movement is observed only in certain sectors, where public agents have more autonomy like that of the public hospitals (i.e., healthcare professionals).

Though management support can be crucial for a successful implementation, the interest of public agents in organizational commitment and public values (Bullock et al. 2015) can enable process change. Conversely, it is quite possible that the top-down strategies, imposed by management, lead to reluctance and resistance by employees. Thus:

**Proposition 7.** A Bottom-up initiated process innovation is more likely to be implemented successfully and become regular.

Lack of incentives and funding is the barrier to implementing innovation in the public sector (Damanpour and Schneider 2009). Process innovation can improve products or services and so benefit the citizens. Moreover, knowing that human resources remain a determining factor in the implementation of process innovations, it seems that agent's decision empowerment and awareness of the social utility of process innovation can favor its implantation. Consequently:

**Proposal 8.** Raising the awareness of public agents to the benefits of process innovation can encourage them to cooperate in the implementation.

Performance Evaluation (PE)

A process life cycle generally includes four stages of design, configuration, execution, and assessment. Some techniques are useful in each process life cycle, such as modeling and improvement methods (Rosemann and vom Brocke 2015). Performance assessment concerns both process and project evaluation. For Spanyi (2015), performance must be measured from the perspective of users and society. The evaluation of process performance can be considered as a tool for the execution of the organizational strategy (Willaert et al. 2007).

Underutilization of an allocated budget would not be a resource for the public organization because budget surplus must be restored to public resources. This fact can affect the agent's motivation to save and reduce costs (Ouellet 1994). In the public sector, the cost control lever is presented in the mandates and obligations to be respected. Thus, this is quite normal that public bodies are more reluctant to the risks associated with the innovation whose results are uncertain.

The innovation performance evaluation is sometimes very requested in public organizations. These latter are generally worried about the little-known impacts of innovation on the society, citizens, environment, and public funds; nevertheless, some benefits are difficult to quantify.

The dynamic nature of technological elements of process innovation can prevent accurate determination of cost-benefit relationship. Furthermore, before the maturity stage of innovation, it may be hard to estimate its short-term consequences because innovation continues to evolve and adapt to the context.

**Proposal 9.** Evaluating a process innovation in early stages of adoption may delay its implementation.

## Conclusion

Process innovation, as a subset of organizational innovation, is a new way of doing activities present in different business sectors. It may involve both new processes and new technologies, giving it a hybrid image.

Process innovation implementation is still a concern for practitioners and scholars. Process innovation literature in the public sector focuses primarily on process redesigning methods, while in this entry, using the same literature, the implementation conditions of process innovation have been analyzed.

Public values, resources, agents' priorities, decision-making modes, and service structure are decisive elements in the implementation. The latter can be affected by organizational, technical, cultural, or strategic factors. Confronting public features with the factors affecting process innovation implementation has led to several non-exhaustive proposals.

This entry provides a general framework for the implementation of process innovation in the public sector. The proposals can be applied both by practitioners and researchers for any process innovation type. Their legitimacy highly depends on empirical validations, notably by qualitative research, to contextualize them to the targeted sector. Different contexts can offer different outcomes, so proposals should be examined in different public sectors, such as healthcare or national education.

## Definition

Public procurement and public finance: two strategic activities that play AN important role in the day-to-day operations of government organizations.

## Introduction

The purpose of this entry is to identify the nature of the relationship between procurement and finance functions in the public sector and to emphasize the importance of the strategic role that procurement plays when it works with other functions in the organization, especially the finance function. This entry attempts to focus on the relationship between the procurement and finance functions in state governments as well as the factors that contribute to an effective working relationship between the two functions. The first two sections provide overviews related to each function in the public sector. The third section shows how the two functions are studied in

research and practice, and the final section focuses on a recent study investigating the strategical interactional connection between procurement and finance on the state government level to achieve the organization's mission, visions, and goals.

## Procurement in Public Sector Organizations

Public procurement is defined as "the designated legal authority to advise, plan, obtain, deliver, and evaluate a government's expenditures on goods and services that are used to fulfill stated objectives, obligations, and activities pursuant to desired policy outcomes" (Prier and McCue 2009, p. 329). The procurement department within an organization can operate as a separate unit or be placed under the general management department or the finance department depending on the size and level of government. Governments spend trillions of dollars annually on products, services, and construction (Abutabenjeh and Rendon Forthcoming). With the necessary support from finance, human resources, budget, information technology, and legal functions, procurement manages the funds in an efficient manner, implements laws and policies, and has a say in early discussions related to acquisitions (McCue and Pitzer 2005).

## Finance in Public Sector Organizations

Public finance consists of two sides, the revenue side and the expenditure side (Mikesell 2013). Financial managers need to balance these sides by planning, implementing, reporting, and analyzing financial data (Gruber 2011a, b). The finance department is responsible for posing taxes, paying for goods and services, adding revenue for the organization, and keeping records of receipts and expenditures. The finance department usually is a freestanding department, but it could be located in a variety of places or called by a variety of names. For example, the finance department is called "Department of Treasury" at the federal level, Department of Revenue as a sub-office to the Executive Office for Administration and Finance at Massachusetts' state level, or Department of Finance at the local level.

## Finance and Procurement in Research and Practice

Public procurement, which is an essential subfield of public management (Trammell et al. 2019), contributes not only to the political, economic, and social goals of public organizations (Abutabenjeh et al. 2018) but also to their strategic goals (Abutabenjeh 2020). In spite of this, procurement is still attempting to validate its contributions to research and practice (McCue and Gianakis 2001; Edler and Georghiou 2007; Snider 2006; Snider and Rendon 2012; Trammell et al. 2019). Research in the private sector shows that some financial managers are not paying attention to procurement (Ball 2015; Minter 2009; Rizza 2009), and THAT others are aware of the importance of establishing a working relationship between the two functions (Scout 2016), but the relationship between the departments is either not recognized, or ignored, or not clear, or not fully understood by the finance department (Ball 2015). Recommendations on how to work together were published by the Aberdeen Group (2007) in an attempt to increase overall organization performance. From the public sector perspective, procurement is mentioned as a "sub subject" in financial management textbooks, and few universities are offering introduction classes in public procurement (Snider and Rendon 2012). There appear to be no studies in the literature that have addressed the connection between the two functions in the public sector context (Abutabenjeh 2020).

## The Strategic Interactional Relationship Between Finance and Procurement

The importance of a working relationship between finance and procurement can be related to strategic management. Strategic management

helps organizations make effective, efficient, and resilient decisions (Toft 1989; Bryson 2010). Based on Poister et al.'s (2010) strategic planning and management conceptual framework, Abutabenjeh (2020) investigated the determinants of the interactions between the procurement and the finance functions and the factors that enhance the working relationship them as they affect the ability of the organization to achieve its mission, vision, and strategic goals. Three data resources were utilized: interviews with state procurement officers, state procurement and finance websites, and official documents. With the focus on state government, five public procurement officials from Delaware, Maryland, Massachusetts, Tennessee, and Washington state were asked questions related to the strategic relationship between their procurement and finance functions. Government websites were searched intensively for any information related to both departments and their strategic goals. In addition, documents such as the states' strategic management legislation, programs, policies, procurement codes, manuals, and Bylaws and Rules of procurement were reviewed. Deductive content analysis was used to analyze the collected data. Utilizing Poister et al.'s (2010) strategic management framework and Elo and Kyngäs (2008) content analysis framework, the following phases were conducted: first, the preparation phase which consisted of examining all the text data from all the resources, second, the organizing phase to develop two unconstrained matrices using common themes driven from the data (see Figs. 1 and 2), finally the reporting phase which includes writing a detailed description of the results.

**Procurement and Finance in the Public Sector, Fig. 1** The determinants matrix

**Procurement and Finance in the Public Sector, Fig. 2** The enhancing factors matrix

An analysis of the data revealed that the two departments interact when payment, budget, and advanced planning are required in relation to the needed goods and services. It further showed that the first determinant of the interactional relationship between the departments is whether or not it is mandated by laws passed or policies enacted by the state's legislative body. The second determinant of interaction is whether it is necessary in the normal course of doing business in any public sector organization, and the third determinant of interaction is when it is dictated by best and proven practice.

Beyond the determinants of the relationship, the results looked at the factors that help to improve the interaction between the procurement and the finance departments to achieve the organization's mission, visions, and strategic goals. The five enhancing factors emerging from the 164 data were open communication between both 165 departments, collaboration to enhance daily cooperative interaction to meet their customers' expectations in a strategic manner, performance measures to determine how each unit is utilizing funds, timely adoption of technological changes in response to emergent needs, and a willingness for finance to move from the traditional view of considering the procurement department a back-room operation.

## Conclusion

Researches have emphasized the need to recognize the importance of a strategic working relationship between the organizations' functions. This entry focuses on the interactional relationship between the procurement and finance departments to achieve the organization's mission, vision, and strategic goals. Traditionally, finance departments considered procurement to be a back-room operation because it assisted in completing the responsibilities of the finance department. Both departments were paying and arranging for the needed products and services. Recently, the finance department is handling payment, and procurement is arranging and issuing the required documents. Each department's job is completing the other. The procurement department plays a more strategic role in helping the organization achieve its mission, vision, and values. Reducing negative stereotyping and embracing collaboration, communication, and change will result in more effectively meeting the organization's strategic goals (Abutabenjeh 2020).

# Procurement at the Local Level

Andrea S. Patrucco[1] and Andreas H. Glas[2]
[1]Penn State University, Monaca, PA, USA
[2]Bundeswehr University Munich, Munich, Germany

## Synonyms

Government; Local; Public procurement; Regional

## Definition

Public procurement refers to the process task by which public authorities purchase work, goods, or services from the private sector. This comprises a variety of goods or services, e.g., ranging from the construction, repair, and maintenance of assets such as roads, hospitals, and military equipment to service contracting of consultancies or social care. Besides those specific product category groups of the public sector, public procurement also has to supply public authorities with standard items such as pens, paper, laptops, or furniture. This entry addresses the peculiar type of public authorities on the local level. Local level describes the lowest tier of administration in contrast to state-level, centralized forms of administration.

## Introduction

Public procurement is the biggest component of government expenditure in most countries. According to OECD (2019), countries spend around 30% of general government expenditure in procurement that is representing more than 13% of gross domestic product (GDP). This means that, roughly, one-third of all money that the public sector spends is issue of public procurement. Looking at specific countries, we can see that the share of public procurement in relation to the overall government expenditures is 32% for the United Kingdom, 34% for Germany, 27% for the United States, and, respectively, 43% for the Netherlands (the highest) and 20% for Portugal (the lowest).

A closer look onto public procurement reveals that local governments are of high relevance. Local governments are of significant economic interest as these are responsible for slightly more than 50% of awards of contract in some countries (Decarolis and Giorgiantonio 2015) with a monetary share in relation to the overall public procurement spend of around 30–40% in OECD countries (OECD 2019). This implies that despite a country might have a several national public authorities, which execute public procurement processes, a

relevant share of public procurement is executed by the government at a local level.

Local government usually addresses public authorities at the lowest level of administration. Usually, local government comprises heterogeneous forms of public authorities in a range of contexts. These are, among others, regions, counties, districts, towns, municipalities, or even special purpose local governments for schools, health care, etc. As an example, more than 35,000 local governments exist in the United States; more than 7,000 municipalities in Italy; more than 10,000 municipalities in Germany; and more than 10,000 councils and local councils in the United Kingdom. Despite their high number, the size, task, and peculiarities of local government can differ greatly.

Local government is established by federalism, the division of power between a central, national government level and local government levels. The logic is that local government is closer to local issues and thus can better handle these. Thus, responsibilities for some public tasks are given to local government. Often, the division of political power into national and local government is also determining the organization of public procurement. Local governments are usually independent/autonomous in deciding how to procure a range of goods and services to the public, including education, social care, environmental services, and planning. Thus, local government gets the responsibility to procure required input goods or services to execute their public tasks. Another term that describes public procurement at the local level is decentralization, because a high number of authorities at the lowest level of public administration buy the same or similar goods in different regional contexts. The other way round, decentralization means that a single public authority at the local level only has a low procurement volume without the opportunity to establish buying power through bundling demand.

In combination with other characteristics of local governments, namely, limited resources and capabilities, a number of management issues require special attention to execute public procurement at the local level in an efficient and effective manner. The challenges and potential pathways toward operational excellence in public procurement at the local level are described in the next sections.

## The Traditional "Bureaucratic" Perspective of Procurement in Local Government

At the local level, procurement is often a neglected or disregarded aspect. The procurement function is only expected to execute the order process in compliance with normative, legal regulations. The internal customer of the public authority often does know the peculiarities of public procurement law and has no mutual understanding for long lead times or procedural necessities. Therefore, the image of public procurement can often be described as the "bureaucratic role" with the primary objectives to assure compliance with procedures (rather than being focused on the final output of a process), implement standardized practices (to limit degree of freedom in supplier choice), and find the lowest price for most contracts.

In fact, public procurement law sets specific and strict procedural governance, and procurement function is expected to act in conformance with these rules. In many countries, this has become a difficult task, as public procurement law does not only address how to award a contract but also is linked to market regulation laws or public budget law. It is the traditional task of a public procurement department to assure that procedures and contracting rules are respected when awarding contracts to external suppliers.

However, in response to limited public budgets, economic crisis, or higher outcome expectations, the question is how to improve public procurement management. In recent years, public managers at all government levels begun to reconfigure the procurement system.

## The Strategic Role of Local Government Procurement

The biggest issue about procurement management at the local level was the lack of "strategic

alignment" between policy, broader government objectives, and the public procurement system (Glas et al. 2017). Today, public procurement is recognized as an important lever for government policy implementation, and local government should design procurement system in order to support specific government strategic objectives. Following Harland et al. (2019), these can include:

- Improving innovation
- Supporting small business development and entrepreneurship
- Improving social outcomes
- Improving environmental sustainability
- Increasing employment
- Improving quality of local public services
- Developing competitive supply markets
- Supporting the industrial development of particular sectors and local economies
- Sourcing from local suppliers to have economic impact at a national level

The shift toward the strategic role of public procurement sets a new focus on management tasks within the procurement function. For example, early procurement involvement may alter demand description and thus allow innovative start-ups to apply for the contract. Revised or improved award criteria could improve environmental sustainability. This shows that adherence to legal governance and efficiency are of importance but contrast these "traditional" dimensions with recent strategic perspectives on effectiveness.

## Management of Public Procurement at the Local Level

Starting from this, local governments should execute an appropriate management process to develop procurement strategy, which can be conceptualized at five levels (Patrucco et al. 2017):

1. The "make-or-buy strategy," defining how contracting authorities interact with supply markets
2. The "organizational strategy," defining how procurement department is structured
3. The "category strategies," defining how procurement is executed for different goods
4. The "process strategy," defining how procurement activities are executed
5. The "awarding strategy," defining how suppliers are selected and contracts awarded

Hitherto, public procurement in particular addressed the last two aspects (by legal regulations). But organizational strategy represents, for sure, the most critical aspect. A sound organization builds the basis to pursue operational targets and provide support to the delivery of the broader government objectives. Unfortunately, the procurement organization remains a challenging issue in local governments, as at this level, institutions often lack sufficient resources and skills.

Usually, procurement organizations may vary from more straightforward to more complex structures. Alternative configurations exist, and their distinguishing characteristics are the level of centralization, the level of procurement responsibilities, the level of process formalization, and the integration with other government functions (Glock and Broens 2013). This entry provides insights how to manage and organize public procurement at the local level. For this purpose six different alternatives are presented in Table 1, following the works of Patrucco et al. (2019).

The suitability of these organizational models can be discussed in light of some local government specific contingent factors. Decentralized models seem to be a diffused structure in the smaller local governments, where the magnitude of spending is limited, and in which procurement is likely part of the traditional administrative role. On the one hand, this model does not require substantial resources to be dedicated to the execution of procurement activities (that a small institution cannot allocate). On the other, the scale of available resources does not justify a more complex structure.

In contrast, the hybrid models seem more diffused in medium-sized local governments, where resource availability (and dimension) is

**Procurement at the Local Level, Table 1** Procurement organizational models in local governments

| | Decentralized configurations | | Hybrid configurations | | Centralized configurations | |
|---|---|---|---|---|---|---|
| | Connected procurement | Local procurement | Hub procurement | Silo procurement | Authoritative procurement | Supportive procurement |
| **Description** | The procurement department is responsible for very few categories (mainly noncritical purchases) and is directly involved in the decision-making activities and sourcing guideline definition for strategic purchases managed by other departments, with a strategic consulting role | The procurement department doesn't have any formal responsibilities in the procurement process given that purchasing responsibilities are fragmented among the different departments; the procurement department may act as a controller of budget and procedure and/or support | Procurement resources are "distributed" in the different departments. Strategic and technical guidelines for specific and critical purchases are usually provided by single departments, and operational activities are executed by on-site staff | The procurement department is responsible for the supply of nonspecific goods and services and in charge of both operational and decision-making activities; the supply of specific technical goods and services is directly managed by single departments | A strong procurement department is responsible for all the procurement operational and decision-making activities, within a centralized structure | The procurement department is directly responsible for executing all the operational activities for the different categories, which are fully centralized |
| **Level of centralization** | Noncritical purchases are centrally managed by the procurement department for strategic and operational activities, while other categories are managed at the department level | No categories are the responsibility of the procurement department, which can be involved in activities as needed by single departments | The procurement department is responsible for common goods and service purchases, while technical categories are managed at the departmental level | The procurement department is responsible for common goods and service purchases with marginal or no visibility (and involvement) on other categories | All the categories are centrally managed for both strategic and operational activities | All the categories are centrally managed for operational activities, with strategic guidelines communicated by single departments and/or final users |
| **Span of control** | The procurement department manages the whole process for noncritical categories, and it is involved and consulted for strategic sourcing decisions on other categories | The procurement department has no defined responsibilities except for assuring internal and external compliance to procedures | The procurement department has responsibilities for both operational and strategic activities for categories under its control, providing operational support for others | The procurement department has responsibilities for both operational and strategic activities for categories under its control | The procurement department has responsibilities for both strategic and operational activities | The procurement department has responsibilities only for operational activities |

| | | | | | | |
|---|---|---|---|---|---|---|
| **Level of internal integration** | There is a great deal of integration and interaction between the procurement and single departments; even though in a reactive and uncoordinated way, strategy and decision are driven by the procurement department | There are frequent and unpredictable interactions with other departments, as most of resources do not have competencies for managing procurement activities independently | Frequent, planned, and intense meetings with heads of single departments are in place in order to align procurement category guidelines in and out of the scope of the procurement department | Integration is very weak as procurement decisions are taken independently by the procurement department and single departments according to category responsibility distribution | Coordination meetings with other departments are planned, with spot interactions for technical support | No formal or planned coordination mechanisms are in place, as communication between the procurement department and other departments takes place on a regular basis, albeit in a reactive way |
| **Level of process standardization** | Procurement tools and procedures are designed and shared among all departments | Procurement tools and procedures are designed and shared among all departments | Procurement tools and procedures are shared and made available to all departments, and targeted cross-functional meetings are planned regularly | Procurement tools and procedures are defined at a general level; the procurement department is often not aware how the process should be executed in other departments | Procurement tools and the procedures manual are defined at a general level, as all the activities are executed within the same department | Procurement tools and procedures are defined at a general level but communication mechanisms with departments and can occur in unpredictable ways |

insufficient to justify a fully centralized solution but able to support sharing responsibilities regarding the various categories of goods and services purchased by the institution, with coordination, alignment, and information exchange continuing to occur in many informal ways.

Finally, high investments are required to design and implement the centralized configurations, in addition to a robust managerial commitment to defending the authority and role of the procurement department within the institution. Therefore, an investment of this type can be justified for large local governments, which serve a high number of citizens (where efficient and effective procurement management has a pervasive impact on the government's ability to provide better services), spend a significant amount of money, and can rely on a strong human resource base with specific competencies to execute the various procurement processes.

## Increasing Procurement Operational Excellence at the Local Level

Besides the choice of organization, an increase in the efficiency and effectiveness of public procurement process also depends on the type of resource investments local governments are able to make to support procurement in their authorities. This entry will highlight two major pathways for local governments toward operational excellence: (1) e-procurement and digitalization and (2) professionalization and training.

On one side, there is a debate about the use and adoption of e-procurement in order to guarantee better support in the execution of activities and more knowledge about the suppliers and, ultimately, supply base optimization (e.g., Walker and Brammer 2012). Several public authorities have decided to invest in digitalization technologies and to introduce e-procurement systems. Modern systems can use business analytics of big data to forecast demands and to execute market analysis, while they enable automation of order processing and other activities (Glas and Kleemann 2016). Then, procurement staff can focus on strategic issues, because the traditional governance adherence is monitored or even executed by the e-procurement systems.

On the other, with the intention to make the strategic role of procurement in local governments higher and higher, organizations constantly must look for employees who have skills necessary to deal with the wide variety of tasks faced by purchasing professionals. Thus, there is a need for professionalization, training, and certification (Prier et al. 2010). Procurement professionals in a local government context are undoubtedly expected to have a multiplicity of skills ("generalists"). On the other hand, the procurement domain becomes more complex, what would call for more focused skills ("specialists"). Developing public procurement capabilities is crucial for local governments. These capabilities comprise several dimensions:

- **Management skills**, which include competences in strategic management, project management, and communication. This capability is required to match superior policies, internal demand, and budget restrictions with market opportunities.
- **Relationship skills**, which include competences in contracting management, including negotiating. This also comprises supplier relationship management and claim management.
- **Technical skills**, which include competences and the ability to discuss demand descriptions with internal customer and potential supplies but also refer to the use of procurement electronic systems.
- **Analytical skills**, which include competences in forecasting, in calculating, and generally in data analysis. An example is the ability to apply a total life cycle or spend analysis approach.

Several procurement organizations, such as the National Institute of Government Purchasing (NIGP) and Chartered Institute of Purchasing and Supply (CIPS), offer extensive training programs that can help procurement professionals in local governments to develop their capabilities.

## Conclusion

This entry introduces the management dimensions that must be addressed when developing public procurement at the local level of government. The focus was on procurement organization, while two pathways for strengthening the function are strived: e-procurement and professionalization.

# Procurement Integrity

Carol Cravero
Università degli Studi di Torino, Torino, Italy
Université Paris-Nanterre, Nanterre, France

## Synonyms

Honesty; Probity; Professionalism; Righteousness and anticorruption

## Definition

Procurement integrity is a principle/objective aiming at ensuring that public officials' conducts follow ethical standards and moral values of honesty, professionalism, and righteousness throughout the public procurement process.

## Introduction

Public procurement refers to the purchase of goods, services, and works which satisfies a public entity's own needs. It represents a key governmental economic activity which accounts for a significant part of the national public expenditure. According to some estimations, around 10–15% of the gross domestic product (GDP) is spent on public procurement across the world (OECD 2009), but percentages may vary greatly from one country to another.

Considering the size of procurement, public funds – normally coming from taxpayers' or financial institutions' money – need to be used in a proper and sound way in order to both reduce financial resources waste and obtain the best procurement outcome at the best possible price, in line with citizens' and business' expectations.

However, public procurement has traditionally been identified as one of the government activities most vulnerable to corruption and fraud. Even though public procurement cannot be considered as a cause of corruption, it represents "an

opportunity which the potentially corrupt may seize upon to engage in corruptive practices" (Trepte 2005).

As a result of the profoundly negative impact that corruptive practices may have in procurement, integrity has received a good deal of attention over time. Most of the national and international legal instruments focusing on public procurement express integrity either as a procurement objective or as a principle. Regardless of the specific formulation as an objective or a principle, it is widely agreed that integrity standards should be put at the core of any public procurement policy.

However, even if the lack of integrity is a well-documented phenomenon in procurement (Gabriella M. Racca, Christopher R. Yukins), fighting corruption by ensuring integrity remains one of the main challenges in public sector purchasing (Anderson et al. 2011). In particular, difficulties may arise in (i) identifying what and when risks may occur, (ii) adopting different types of integrity measures, (iii) finding a proper balance between good governance principles, and (iv) involving different actors in the procurement process.

## Corruptive Practices in Public Procurement Markets: An Overview

Integrity means first and foremost understanding what corruption is (Transparency International). According to a large part of the international community, integrity violations in procurement are facets of corruption, "which includes bribery, kickbacks, nepotism, cronyism and clientelism; fraud and theft of resources, for example through product substitution during delivery, resulting in lower quality materials; bid collusion and bid rigging; abuse and manipulation of information; discriminatory treatment in the public procurement process; and waste and abuse of organizational resources" (UNDP 2017).

This large definition includes different types of bad practices which might also be considered separately from corruption, such as conflicts of interest, bid collusion, professional misconduct, or other types of unethical behaviors. However, the purpose of such a definition is to shape a broad concept of corruption and embrace every facet of it, regardless of possible national divergences.

Accordingly, corruption may come in many forms, all of which are likely to compromise the public interest at the advantage of (illicit) private interests. According to the principal-agent model, the relationship between the procurer (*agent*) and the government or the public (*principal*) is central to the practice of public procurement. When the procurer acts in order to enrich him or herself at the expenses of the government or the public, the public interest is put aside for an improper gain or for other undue benefits. This kind of conduct represents an abuse of the power that has been entrusted to the public official and is likely to undermine both government efficiency and sustainable development (Robert Wade 2003).

The literature agrees in considering corruption as a barrier to economic efficiency, to development, and to trade, as well as a threat to both the sound management of public funds and the public health, safety, and trust. In this respect, corruption leads to a loss of (public) money and of expected quality of procurement outcomes, as well as a potential risk to public health and safety, and a decrease of public trust in government and public administration. For instance, corruption may lead to the delivering of substandard, unhealthy, or unsafe products, services, and works (as in the infrastructure sector), or to the conclusion of contracts which are unnecessary or not aligned with public needs and interests (see for details OECD 2013).

This illustrative and nonexhaustive list of consequences gives an idea of the extent of the problem. Transparency International (2010) estimated that "systematic corruption can add at least 20–25 per cent to the cost of government procurement." In terms of global GDP, corruption could represent 5% of the GDP corresponding to around 2.6 trillion USD, with over 1 trillion USD paid in bribes each year across the world (Racca and Yukins 2014). However, the real magnitude of corruption in terms of costs is difficult to quantify precisely, given also its hidden nature.

According to the OECD (2016), consequences of corruption in public procurement should be understood in terms of direct and indirect costs. Direct costs include, among others, higher or exaggerated expenses and lower quality of procurement outcomes. These costs may occur, for instance, when works are not performed but nevertheless billed as duly done, or when contract standards are not met, or even when the quality of works is reduced by using lower-quality materials. On the other hand, indirect costs refer to the effects that corruption has in terms of competition distortion, market access limitation, and loss of business confidence in the public sector.

## Integrity Risks and Measures to Fight Corruption Throughout the Public Procurement Cycle

Public procurement process can be understood as a cycle made up of diverse phases, namely, pre-bidding, bidding, and post-bidding phases, also referred to as procurement planning (including needs assessment, development of specifications/requirements, choice of procurement procedure), tendering and award (including bid submission, bid evaluation, contract award), and contract management.

Integrity risks occur along the whole procurement cycle, but their nature may differ for each step. Without attempting to provide an exhaustive list of all integrity risks, it is sufficient to note that corruption might unfairly determine the winners of government contracts (for instance, favoring friends or relatives of procurement officials) or might impact service delivery (World Bank 2018). According to Rose-Ackerman (1975), corruption may affect the identity of the seller and the terms on which the sale is made. More specifically, corruptive practices may, on the one hand, interfere on the decision on which tenderers are admitted to the process and on which are excluded; and, on the other hand, they may have an effect on the definition of technical requirements/specifications, as well as on evaluation and award (Trepte 2005).

This means that an integrity-oriented approach should not just focus on one phase of the cycle or on one type of risk only, but on the contrary it should be based on a holistic strategy (see for details OECD 2016). Accordingly, each type of corruption risk is equally important, and tackling all of them at all purchasing stages is critical to achieving procurement outcomes based on efficiency and quality and more broadly to realizing (a more) sustainable development (UNDP 2017).

From a prevention perspective, detecting possible irregularities in advance is pivotal and, at the same time, challenging. For this reason, some *red flag* indicators have been developed at different levels (sub-national, national, international) drawing on criminal investigations related to effective anticorruption safeguards and due diligence (World Bank 2007). These indicators may help public officials, business, and various stakeholders recognize the main risks and the key points to be verified throughout the procurement process (see, for instance, Kenny and Musatova 2010).

From the repressive perspective, corruption in public procurement is usually considered as a criminal offense, but the types of measures and sanctions may vary from one domestic legal system to another.

Concerning the usual dichotomy between preventive and repressive measures, there seems to be a broad consensus that, for an anti-corruption system to work, legislation alone and traditional repressive measures are not enough. Repression should be combined with, at least, (i) a set of preventive actions, (ii) an incentive scheme (Racca and Yukins 2014) imposing "the right incentive or disincentive at the right time" (Trepte 2005), (iii) a mindset change and awareness-raising activities across the society as a whole, and (iv) the promotion of public sector professionalization including ethical values.

Only a balanced combination of preventive and repressive measures can effectively contribute to reduce corruption and enhance integrity in public procurement. However, this also implies a complex interrelation of the various actors involved at different stages of the public procurement process. Apart from the public officials directly engaged in day-to-day procurement activities, there are some other key actors, such as multilateral development

banks (MDB) within specific funding projects, the business community, users and stakeholders, and civil society's organizations.

## Good Governance Imperatives for Promoting Procurement Integrity

It is widely agreed that several mutually interconnected principles may be supportive of procurement integrity. These principles may fall into the broader category of good governance and include transparency, fair competition, accountability, and participation (OECD 2007).

According to the literature, transparency should always be the first choice (Racca and Yukins 2014), as it addresses what is called, in economic terms, informational asymmetries. By ensuring publicity and disclosure of all relevant information, there is less room for corruptive practices which usually have a hidden nature. As observed by UNDP (2017), transparency is designed to make procurement opportunities publicly available, disclose the rules to be followed, provide that procurement processes are undertaken publicly and visibly, limit the officials' discretion, and establish a monitoring system (UNDP 2017).

However, it should be noted that the degree of transparency in the public procurement process is a matter of balance; it is about ensuring a high level of transparency without disclosing information that should be kept confidential. Transparency finds, indeed, its limits in the protection of commercial interests and business secrets (Halonen et al. 2018). Moreover, it has been observed that, under some circumstances, a "too liberal dissemination of information" may contribute to enhance opportunities for collusion among suppliers (Anderson et al. 2011). Therefore, a balance should be struck between transparency and competition, so that fostering integrity through transparency-enhancing measures is consistent with the promotion of competition (Roberto Caranta 2010).

Transparency requirements also enable the procurers' actions "to be verified in a way which ensures responsibility and accountability through the application of enforcement mechanisms" (Trepte 2005). This implies that a clear chain of responsibility should be set out, and effective control mechanisms should be established. Moreover, a particular attention should be paid to the media's, the civil society's, and the wider public's empowerment, since they may play a pivotal role in scrutinizing public procurement activities. But to do so, their awareness of corruption risks should be enhanced by means of general public education initiatives or other specific training activities (Anderson et al. 2011).

The participation of civil society is often required under the terms of the so-called Integrity Pacts (Cravero 2018). These usually come in the form of a signed document which commits a contracting authority and bidders to comply with best practices, integrity, and maximum transparency (Transparency International, The case for integrity pacts). Civil society is a third actor which may be involved at different levels: it may be required to monitor the procurement process, it may be asked to discuss the official steps taken in the context of the contract, and, more generally, it may play a key role in overseeing the correct and full implementation of the Integrity Pact by the parties.

The Integrity Pact usually contains no-bribery commitments and disclosure obligations, such as the undertaking by the public entity that its officials will not demand or accept any bribes, with appropriate disciplinary or criminal sanctions in case of violation; the statement by each bidder that it has not paid, and will not pay, any bribes in order to obtain or retain the contract; and the undertaking by each bidder to disclose all payments made in connection with the contract in question to anybody including agents and other middlemen as well as family members (see for details Transparency International, *The case for integrity pacts*). References to the implementation of Code of Conduct rejecting the use of bribes and other unethical behavior may also be made. However, there can be some differences from one Integrity Pact to another as adopted, and specifically adapted, by governments or local public authorities.

Overall, it should be noted that transparency, accountability, participation, and fair competition are some of the good governance imperatives

which constitute, if properly balanced by each other, the building blocks for an integrity-based public procurement system.

## Conclusion

Public-sector purchasing is widely considered as being one of the areas most exposed to corruption risks. The high costs and negative impacts of corruptive practices have contributed to draw the attention on integrity-related issues in public procurement.

However, fighting corruption remains a challenging objective when it comes to the achievement of good governance in the public sector.

First of all, challenges occur in defining what type of and when integrity violations might be committed throughout the procurement cycle. This might be a particularly difficult task, especially given the (pretty much) hidden nature of corruptive practices.

Secondly, challenges may also come from the necessity of balancing preventive and repressive measures in order to enhance integrity. Risk assessment, bad practice detection, and sanction application should be at the very heart of any integrity-based procurement system. In this regard, prevention and repression cannot anymore be understood as two dichotomic alternatives but rather as mutually reinforcing approaches.

Moreover, various actors, including civil society's organizations, should be involved at different stages of public procurement, for instance, in monitoring the effective integrity of the purchasing process. Integrity Pacts are an example of this kind of civil society's engagement, although there can be some differences from one specific Integrity Pact to another.

Finally, challenges also arise when it comes to properly balancing good governance imperatives. Integrity promotion needs a transparent-enhanced set of measures. These measures might however compromise, if mishandled, the level playing field between suppliers and lead to a collusion risk.

Although it is widely recognized that transparency, accountability, participation, and competition are at the very heart of any integrity procurement system, it is also acknowledged that, for these principles to be mutually supportive of each other, a proper balance must be struck. From this point of view, there might be a high degree of synergy between different objectives and principles in public procurement.

# Procuring for Sustainability: Prioritizing Preferences

Jessica N. Terman
Schar School of Policy and Government, George Mason University, Fairfax, VA, USA

## Synonyms

Contracting out; Environmentalism; Green purchasing; Purchasing

## Definitions

Sustainability: Avoidance of natural resource depletion, able to maintain production rate perpetually at a constant level

Green procurement: Procurement of goods or products that do not deplete natural resources

Climate protection networks: Networks (often of local governments) focused on long-term policies to mitigate climate change

## Introduction

There is a robust and growing literature on the adoption of sustainability policies in US local governments. Scholars have examined locality involvement in climate protection networks, sustainability policy adoption, and the allocation of resources for sustainability-oriented responsibilities (Hawkins et al. 2015). This chapter addresses the dearth of scholarship in the public administration literature on one of the most significant ways that local governments have of advancing sustainability goals: the adoption of green procurement policies (Testa et al. 2016). Specifically, it is tested whether three factors commonly found to impact sustainability policy adoption – general and sustainability-specific professional management (Terman and Feiock 2015), membership in climate protection networks, and interest group support (Deslatte and Swann 2015) – influence the adoption of green procurement policies (GPPs).

## What Is Green Procurement Policy?

Green procurement, also known as environmentally preferable purchasing (EPP), is defined according to the United States Environmental Protection Agency (EPA) as "selecting products or services that have a lesser or reduced effect on human health and the environment when compared with competing products or services that serve the same purpose" (US EPA 2000) (The National Association of State Procurement Officials (NASPO) defines GPP as "purchasing a product that has a lesser or reduced negative effect

or increased positive effect on human health and the environment when compared with competing products that serve the same purpose" (NASPO 2016). Similarly, the European Commission defines GPP as "a process whereby public authorities seek to procure goods, services and works with a reduced environmental impact throughout their life cycle when compared to goods, services and works with the same primary function that would otherwise be procured"). GPPs can be suggestive or mandatory, with some public organizations requiring the use of environmentally preferable criteria in purchasing decisions, while others simply suggest substitutions where available and when cost considerations allow. This flexibility is particularly important because, while organizations that buy green are perceived as socially responsible, the practical benefits are difficult to systematically capture (Carter 2005). Moreover to see these benefits, a considerable up-front investment is often required – the gains from which might not even be realized (Carter 2005).

### Determinants of Green Procurement in Public Organizations

While clearly a growing practice across both public and private organizations in the USA (Roman 2017), GPPs have received minimal empirical attention – particularly in the public administration literature (Roman 2017). Much of the literature contains case studies or descriptive analyses – which have limited generalizability (Roman 2017). For example, some scholars have examined major procurement projects in individual states such as Massachusetts (Coggburn and Rahm 2005) and California (Case 2007). Lange et al. (2014) observed that public procurement overall and green procurement specifically are more commonly researched in Europe than the USA.

Of the GPP empirical research in public organizations in the American setting, two particular pieces of scholarship stand out. In a random sample of green procurement plans in US counties, Smith and Terman (2016) find that GPPs have minimal adoption. Approximately one third of the counties have formal GPPs. Of that third, policies range from strict requirements such as a prohibition on the use of styrofoam or products from virgin wood to suggestions that products made from recycled material should be procured when possible.

The second study, conducted by Roman (2017), uses the term "sustainable procurement" (1048) rather than green procurement or environmentally preferable purchasing. Sustainable procurement is therein defined as "purchasing, contracting and supply practices, emphasizing sustainability and thereby seeking to accomplish sustainable outcomes" (Roman 2017, 1049) (NIGP defines sustainable procurement as "a purchasing and investment process that takes into account the economic, environmental and social impacts of the entity's spending. Sustainable procurement allows organizations to meet their needs for goods, services, construction works and utilities in a way that achieves value for money on a whole-life basis in terms of generating benefits not only to organization, but also to society and the economy, while remaining within the carrying capacity of the environment" (NIGP 2012, 1)). Roman (2017) develops one of the first frameworks to explain the adoption of organizational sustainability procurement practices. He finds a relationship between sustainable procurement practices and various dimensions of leadership, stakeholder expectations, and interdepartmental collaboration. This chapter builds on Roman's work and tests whether the traditional determinants of sustainability activity also influence GPP adoption.

## Hypotheses

### General and Sustainability-Specific Professional Management

Professional management that influences the likelihood of adopting sustainability policies can be divided into two component parts: general and sustainability-specific (Terman and Feiock 2015). General management may be understood in terms of form of government – mayor-council or council-manager. Council-manager governments produce more efficient outcomes, while

mayor-council governments are more responsive to the local constituency (Feiock et al. 2003). City managers are professionalized to focus on responsible prudent management; elected officials may not have the background – or incentive – to do so. This is because the incentive structure of the latter depends on reelection (Feiock et al. 2003), while the incentive structure of the former is based on the ability to efficiently and professionally manage the information and human and technological resources of a given government (Terman and Feiock 2015. While efficiency and responsiveness are not mutually exclusive, there is evidence to suggest that the professional norms and career interests of city managers incentivize innovation and fiscal prudence in internal government operations (Terman and Feiock 2015).

GPPs are internal operations that have the potential to make governments more efficient. Furthermore, GPPs can have a number of efficiency gains for the internal operational functions of governments. As such, it is suspected that local governments with heightened levels of general professional management – council-manager forms of government – are more likely to adopt GPPs (H1a).

While the same directional relationship for sustainability-specific knowledge-based management is expected, the reasons are somewhat different. The dedication of municipal resources for sustainability-oriented purposes represents the prioritization of sustainability goals and the knowledge-based capacity to successfully pursue those goals (Hawkins et al. 2015). While some governments may give lip service to green management and sustainability, dedicating staffing resources for the sole purpose of managing these programs suggests a genuine desire to achieve sustainability-oriented goals. Moreover, having these dedicated resources means that the attention of policymakers can be drawn to these programs because there will be individuals advocating on their behalf. Furthermore, the resources and expertise accrued by governments that have dedicated resources to sustainability also give governments the ability to be successful in GPP and sustainability-oriented policies. Thus, with the likelihood of achieving programmatic goals, governments will be predisposed to adopt these programs. It is suspected that local governments with sustainability-specific professional management are more likely to adopt GPPs (H1b).

### Climate Protection Networks

Local governments have been involved in various climate protection networks such as the United States Conference of Mayors (USCM) Climate Protection Agreement (CPA) and the International Council for Local Environmental Initiatives (ICLEI). Membership in these organizations can represent both a symbolic and substantive move toward the prioritization of sustainability.

Following the Kyoto Protocol agreement, USMC members began signing the CPA, and by the end of 2005, there were 141 signatories (USMC signatories made three particular commitments: (1) meet or exceed Kyoto Protocol targets, using anti-sprawl and land use policies, urban forest restoration projects, public information campaigns, etc.; (2) urge state and federal governments to enact policies and programs that meet or exceed the US suggested greenhouse gas emission reduction targets, suggested in the Kyoto Protocol – 7% reduction from 1990 levels by 2012 – and (3) urge Congress to pass greenhouse gas reduction legislation, thereby establishing a national emission trading system). Similarly, with a considerable membership fee, ICLEI was intended to provide local governments with the knowledge and capacity to manage and build their cities more sustainably. Both of these organizations are representative of a commitment to green infrastructure and climate change mitigation and adaptation. The resources and time that go into being members of the networks indicate a willingness to engage in sustainability, and the information that they provide will likely support local governments in the successful adoption and implementation of GPPs. Thus, it is hypothesized that local governments that are part of climate protection and sustainability networks are more likely to adopt GPPs (H2).

### Interest Group Support

Local interest groups have considerable influence on sustainability policy adoption. Either through their business concerns or political preferences,

local groups can put pressure on governments to adopt their preferences. These groups have been referred to as "demand side factors" (Bae and Feiock 2013) because, in the political market, they are policy demanders seeking the adoption of policies that benefit their interests. These groups include specialized interests such as local businesses, chambers of commerce, and environmental interests in addition to the broader general public (Deslatte and Swann 2015).

Local business and chamber of commerce groups have a professional and pecuniary interest in sustainability policy adoption. In some cases, these groups are providers of public goods and services for local governments. Thus, changes to procurement policies may threaten their ability to make a profit. Furthermore, as some of the work on economic development implies, these business-oriented organizations may see sustainability policies as a threat because they perceive that economic growth and environmentalism operate at cross-purposes. In part, this is because economic growth and the environment have often been considered at odds. Thus, the degree to which these groups support or oppose sustainability policy is important.

Other groups shown to influence sustainability policy are environmental groups. In the same way that economic development groups create headaches for local governments when sustainability policies are advanced that they perceive to be against their interests, environmental groups draw considerable attention to governments that are not engaged in environmentally friendly policies. These groups exert direct pressure through lobbying, campaign endorsements/donations, litigation, etc. They can also exert indirect pressure through public information campaigns that attempt to persuade the local populace of the importance of environmental conservation and sustainability.

As such, the last group hypothesized herein that has considerable influence over local government policies is the local constituency (i.e., the general public as a whole). In comparison to other levels of government, local governments are the closest to their citizens; therefore, in the political market, if citizens demand green policies, local governments experience considerable pressure (Bae and Feiock 2013). Thus, it is expected that local governments where interest groups such as the local chamber of commerce and local business groups, environmental groups, and the general public support energy conservation and sustainability efforts will be more likely to adopt green procurement practices (H3a).

## Research Design

### Data

The two primary data sources for this study are the 2011 and 2012 *Energy Efficiency and Conservation Block Grant Program: Implementation and Impact* surveys, conducted by the Florida State University Local Governance Research Laboratory. The Energy Efficiency and Conservation Block Grant Program (EECBG) was a Department of Energy (DOE) program funded by the American Recovery and Reinvestment Act (ARRA). Cities with populations over 25,000 were eligible for the EECBG. Surveys were sent to the population of EECBG grantee cities (According to DOE administrative data, a total of 1257 municipalities were EECBG recipients, and according to the County and City Data Book (2007), there are a total of 1267 municipalities with populations of 25,000 or greater). To receive DOE funding, cities had to designate a specific staff member as a liaison to the agency. Questionnaires were addressed to this individual in each city. The 2011 survey achieved a 74% response rate (The survey went out to all 1094 EECBG recipients, which yielded a total of 809 respondents), while the 2012 survey achieved a 77% response rate. This extremely high response rate is largely due to the fact that the survey had the support of the DOE and there were both email and paper reminders for non-responders. The independent variables originated from the 2011 survey, while the dependent variables originated from the 2012 survey. The use of multiple surveys prevents, in part, the problem of common source bias in addition to the concern about time order for asserting causation between our independent and dependent variables. The other data sources came from ICMA and Census (see Table 1).

**Procuring for Sustainability: Prioritizing Preferences, Table 1** Operationalizations and descriptive statistics

| Green procurement policies | | Mean (SD) | Min-max |
|---|---|---|---|
| Mandated GPP | Does your city provide guidance on eco-friendly practices in any of the following ways? Stipulates/mandates the use of eco-friendly vendors/products [No = 0, Yes = 1] | 0.129 | 0–1 |
| | *Source*: EECBG 2012 Survey | (0.335) | |
| Permissive GPP | Does your city provide guidance on eco-friendly practices in any of the following ways? | 0.239 | Permissive GPP |

## Operationalizations

### Dependent Variables

The dependent variable of the adoption of GPPs is measured in two ways: (1) maintaining a green public procurement vendor and product list and (2) mandating green product and vendors. The former – permissive procurement policy – was measured using two survey questions asking "whether the city provides guidance on eco-friendly practices" (1) by maintaining a vendor list and (2) maintaining a product list. If a municipality answered yes to at least one of the questions, permissive policy was coded as one. These two permissive practices have a tetrachoric correlation of 0.945 and a standard error of 0.022 ($p < 0.00$). This suggests that they are similar enough to combine into one variable (see Appendix A for a breakdown of this variable). Mandated procurement policy was measured by asking whether the city "stipulates/mandates the use of eco-friendly vendors/products." The tetrachoric correlation between the two dependent variables is 0.706, with a standard error of 0.0631 ($p < 0.00$). Thus, they have a strong correlation, and we made the choice to treat them as two separate variables.

### Independent Variables

Generalized professional management was measured by whether the municipality has a council-manager form of government, while sustainability-related professional management was measured using a survey question asking whether the city has dedicated staffing for sustainability. Participation in climate protection networks was operationalized using 2010 International Council for Local Environmental Initiatives (ICLEI) membership and whether the municipality was a signatory of the Mayor's Climate Protection Agreement. Interest group support was operationalized using survey questions that asked respondents to gauge, "To what extent would you say that the following individuals or groups support or oppose energy conservation and sustainability efforts by your city government?" Local socioeconomic characteristics of the municipality were included as control variables. Table 1 contains the sources, operationalizations, and descriptive statistics for the variables in the analysis.

## Results and Discussion

To test the hypotheses proposed here, two logit analyses were estimated: one for maintaining a green public procurement vendor and product list – a permissive policy – and another for mandating green public procurement vendors and products. The results lend some credence to our arguments that the determinants of sustainability can also help predict GPP adoption. Roughly 24% of local governments in the sample have permissive GPPs – they maintain either or both a green vendor or product list. However, only 13% have adopted a mandated GPP. The overall fit for both models is statistically significant at $p < 0.00$, with a Wald chi-square of 61.52 and 47.67, for mandated and permissive policies, respectively. McFadden's pseudo r-square suggests that the explanatory power of the mandated GPP model is greater (pseudo $r^2 = 0.2138$) than that of the permissive model (pseudo $r^2 = 0.1310$).

Both general and sustainability-specific professional management were significant in the model. The odds that a council-manager form of government will adopt a mandated GPP in

comparison with a council-manager form of government are 2.255–1 (126% greater). The odds that a council-manager form of government will adopt a permissive GPP in comparison with a council-manager form of government are 1.35–1 (35% greater). Thus, it would appear that governments focused on the internal operational efficiency (i.e., council-manager rather than mayor-council) are more likely to adopt GPPs (see Bae and Feiock 2013). In comparison to governments that do not have dedicated sustainability staffing, the odds that governments with dedicated sustainability staff will adopt a mandated GPP are 1.709–1 (71% greater) and 2.173–1 (117% greater) for permissive GPP adoption. This supports the perspective that GPPs can be considered a fundamentally internal activity – like government energy and conservation building programs (Bae and Feiock 2013). And more still, professionalized management seems to recognize the usefulness of these forms of programs. This finding is important because it challenges the assertion that environmentally motivated policies operate at cross-purposes to efficiency and fiscal prudence. Sustainability-specific management also had a positive effect.

ICLEI membership had a positive statistical effect on the likelihood of both mandated and permissive GPP adoption, while the US MCPA signatory status only had an effect on permissive GPP status. In comparison to non-signatories, the odds that local governments that are signatories of the US MCPA will adopt a permissive GPP are 1.578–1 (58% greater). For ICLEI members, the odds for adopting a mandated GPP are 2.492–1 (143% greater) and 3–1 (200% greater) for permissive GPP adoption. Part of this difference may be that ICLEI membership is somewhat more substantive, requiring a considerable membership, while signatory of the MCPA is a one-time occurrence for a local government. For example, new local government leadership may choose to cancel their ICLEI membership, whereas new leaders in signatory cities may change municipal priorities without very much effort. It is important to state that neither organization has a policy where they remove members that are not meeting their policy expectations; thus, both organizations are fundamentally voluntary with little enforcement teeth. However, ICLEI requires more skin in the game because of their membership fee and ongoing socialization through conferences and other professionalization opportunities.

The results for interest group support are equally strong. For every one unit increase in perceived chamber of commerce support, the odds of mandated GPP adoption are 1.131–1 (a 13% increase); the odds of a permissive GPP adoption are 1.245 (24% increase). For every one unit of perceived environmental group support, the odds of mandated GPP adoption are 1.339–1 (34% increase), while the odds of permissive GPP adoption are 1.735–1 (74% increase). For every one unit increase in local business support, the odds for mandated GPP adoption are 2.221–1 (120% increase), while the odds for permissive GPP adoption are 1.665–1 (67% increase).

These results suggest that interest group support of sustainability policies has positive effects on both mandated and permissive GPP adoption. In particular, chamber of commerce and local businesses represent potential vendors and service providers of green products. The adoption of these policies has the potential to affect their bottom lines. The question is whether these groups see GPPs as a form of sustainability policy. If they do, there is reason to question the assumption that sustainability and business interests operate at cross-purposes (for a discussion of this assumption).

And lastly, for each unit increase in perceived support by the general public, the odds of mandated GPP adoption are 1.349–1 (a 35% increase). This is a useful contribution in that the general public often does not realize the breadth of sustainability policies and that GPP adoption may be included in them. The perceived support of the general public may be translated into support of GPPs even if local constituencies do not realize it (Table 2).

The control variables yielded some interesting findings. The percentage of residents over 25 with

bachelor's degrees is positively associated with local government adoption of both mandated and permissive GPPs. This is in line with other studies suggesting that educational attainment influences the adoption of renewable energy tools and technology innovation/demonstrative projects (Deslatte and Swann 2015). In a somewhat surprising result, local governments with city councils that are perceived to be more liberal are less likely to adopt both mandated and

P

permissive GPPs. One reason for this may be that they are already engaged in considerable sustainability programs that green procurement is less likely to be on their radar. Population density, unemployment rate, and median home value are all positively associated with adoption of both mandated and permissive GPPs. Population density and municipality wealth have been previously associated with the adoption of renewable energy and conservation policy tools. In part, more densely populated areas are more likely to have robust communities with the ability to provide green products. And, municipal wealth, which may be demonstrated through home value, is often associated with the adoption of energy efficiency and conservation policies because these communities can best afford it.

## Conclusion

The results here suggest that GPPs should be more widely studied in the sustainability lexicon. All three categories of our variables of interest – professional management, climate protection network membership, and interest group support – had a statistically significant positive effect on GPP adoption. Individually, each of our variables contributes in different ways to this conclusion. The effect of professional management – both general and sustainability-specific – suggests that the fiscal prudence of this green procurement is growing. Similarly, the relationship between climate protection network membership and GPP adoption supports some of the literature on European and North American sustainability policies, which have historically directed governments to use their purchasing power to advance environmentalism (Case 2004). And lastly, the fact that interest group support of sustainability also translates to GPP adoption suggests that there may be a broad group of political interests whose support is needed for their adoption.

Overall, the core contribution of the study is that it isolates one form of sustainability policy – green procurement, a practice that has not been frequently discussed in the sustainability literature. This is important because GPP adoption is one of the most proactive ways that governments engage in sustainability. Taking this argument one step further, one might consider that municipalities engaged in mandated GPPs are truly dedicated to sustainable governance because these policies make a choice between traditional and green product and service purchasing. However, to reliably make this conclusion, GPP adoption must be tested against other forms of sustainability policies to determine levels of commitment. Thus, there additional research needs to be done in terms of comparing sustainability policy adoption with GPP adoption in the same study as dependent variables. Additionally, our measures of sustainability deserve more precision and how different sustainability policies relate to one another.

# Product Development Partnerships: Collaborative Multi-sector Regimes to Accelerate Vaccine Development

Muhammad Azfar Nisar[1] and Christopher S. Hayter[2]

[1]Suleman Dawood School of Business, Lahore University of Management Sciences, Lahore, Pakistan

[2]School of Public Affairs, Arizona State University, Phoenix, AZ, USA

## Synonyms

Collaborative governance; Collaborative governance regime; Interorganizational collaboration; Public-private partnerships

## Definition

Product development partnerships (PDPs) are innovative collaborations among public, private, and nonprofit institutions from around the world the purpose of which is to accelerate the development of vaccines to prevent communicable diseases within the poorest of nations.

## Discussion

### Vaccine Development: A Wicked Policy Problem

As shown in Table 1, vaccine development for some of the deadliest and most contagious diseases in the world – like AIDS, malaria, TB, and the "neglected" tropical diseases (NTDs) – continues to remain a wicked policy problem for which no clear solution exists. These diseases affect more than a billion people (Hotez et al. 2006, 2007) and result in an estimated five million deaths annually (Kremer and Glennerster 2004). The problem is exacerbated by the fact that most diseases for which vaccines do not exist

P

**Product Development Partnerships: Collaborative Multi-sector Regimes to Accelerate Vaccine Development, Table 1** Relevant policy actors for vaccine development for neglected tropical diseases

| | Motivation | Funding | Capacity |
|---|---|---|---|
| Developing countries | ✓ | ✗ | ✗ |
| Developed countries | ✗ | ✓ | ✓ |
| Industry (pharmaceutical companies, university research centers) | ✗ | ✗ | ✓ |

disproportionately affect developing or underdeveloped countries which do not possess the financial, scientific, or human resources necessary to develop efficacious vaccines.

On the other hand, large private pharmaceutical companies based in developed countries that have the capacity to carry out research and development (R&D) for vaccine development have little incentive to develop vaccines for the developing world due to limited profit opportunities; developing countries are seldom in a position to buy expensive vaccines unless they are heavily subsidized. Similarly, public health agencies within the developed countries – where these diseases are not endemic – have little political motivation to prioritize vaccine development for the developing world.

## Emergence of the PDP Model

At the end of the twentieth century, several stakeholders acknowledged the growing developing world public health threat posed by diseases like AIDs, tuberculosis, and malaria. These stakeholders also recognized that no single government, sector, or organization could develop vaccines for such diseases on their own. The result was the emergence of shared motivation among relevant policy actors to do something about this important policy problem (Widdus and White 2004).

Collaborative meetings in the late 1990s among influential public and nonprofit organizations led to joint commitment to devise potential vaccine development solutions eventually leading to the emergence of the PDP model. While many organizations were involved, the Bill and Melinda Gates Foundation (BMGF) – an international nonprofit organization – played an especially important leadership role in the conceptualization, establishment, and funding of the PDP model, a role that continues today. Although similar organizations already existed, the International AIDS Vaccine Initiative (IAVI) was established in 1996 as the first organization designated as a vaccine-focused PDP, and more than 15 additional PDPs have been established since (see Table 2).

## The PDP Model

PDPs are nonprofit organizations which seek to focus constituent partners and their respective resources on accelerating the development of vaccines for the developing world. As Hayter and Nisar (2016) note, PDPs may be characterized as a type of collaborative governance regime (CGR) (Emerson et al. 2012), "a system in which cross-boundary collaboration represents the predominate mode for conduct, decision making, and activity" (p. 10). PDPs attempt to address complex technical, financial, and human resource challenges that make vaccine development for tropical diseases a wicked policy problem.

PDPs are funded by charitable foundations, such as the Gates Foundation, and public sector development agencies such as The Department for International Development (DFID), United States Agency for International Development (USAID), and National Institute of Health (NIH) (Moran et al. 2014). Funds are used to carry out in-house vaccine research and development (R&D) or to partner with public and private institutions, such as universities or pharmaceutical companies, to develop potential new candidates for vaccine synthesis. Funded partnerships are especially important given that many of these organizations do not want to invest their own resources.

From identification of promising vaccine candidates and conducting preclinical and clinical trials to the manufacture of final vaccine products,

**Product Development Partnerships: Collaborative Multi-sector Regimes to Accelerate Vaccine Development, Table 2** Important information about key product development partnerships (PDPs)

| PDP | Year established | Funding 2014 | Disease focus |
|---|---|---|---|
| Program for Appropriate Technology in Health (PATH) | 1977 | 121 Million | Multiple (Japanese encephalitis, malaria, diarrhea, rotavirus, ETEC, shigella, pneumonia, influenza, meningitis) |
| Medicine for Malaria Venture (MMV) | 1999 | 77 Million | Malaria |
| Drugs for Neglected Diseases Initiative (DNDi) | 2003 | 58 Million | Multiple (e.g., leishmaniosis, sleeping sickness, Chagas disease, malaria, pediatric HIV, filarial diseases) |
| TB Alliance | 2000 | 58 Million | Tuberculosis |
| Aeras: Advancing Tuberculosis Vaccines for the World | 2003 | 55 Million | Tuberculosis |
| International AIDS Vaccine Initiative (IAVI) | 1996 | 41 Million | HIV/AIDS |
| International Partnership for Microbicides (IPM) | 2002 | 29 Million | HIV/AIDS |
| Foundation for Innovative New Diagnostics (FIND) | 2003 | 26 Million | Multiple (tuberculosis, malaria, sleeping sickness, hepatitis C, HIV, leishmaniosis, Buruli ulcer and Chagas disease) |
| Contraceptive Research and Development Program (Conrad) | 1985 | 17 Million | HIV/AIDS |
| Infectious Disease Research Institute (IDRI) | 1993 | 14 Million | Multiple (malaria, leishmaniosis, tuberculosis, Chagas disease, leprosy, meningitis, pneumonia/influenza) |
| Innovative Vector Control Consortium (IVCC) | 2005 | 10 Million | Multiple (malaria, dengue) |
| International Vaccine Institute (IVI) | 1997 | 6.4 Million | Multiple (cholera, enteric fever, dengue) |
| Sabin PDP (initially HHVI) | 2000 | 5.7 Million | Multiple (human hookworm disease, leishmaniosis, Chagas disease, helminths, schistosomiasis) |
| European Vaccine Initiative (EVI) | Established as European Malaria Vaccine Initiative in 1998 | 3.4 Million | Multiple (malaria, leishmaniosis, tuberculosis, Chagas, dengue, HIV) |
| Tuberculosis Vaccine Initiative (TBVI) | 2008 | 1.5 Million | Tuberculosis |
| Institute for One World Health (OWH) | 2000–2011 | Funding included under PATH since 2013 | Multiple (malaria, leishmaniosis, helminths, cholera/diarrheal disease) |

The information about individual PDP funding comes from "G-finder report 2015" which can be accessed at http://policycures.org/downloads/Y8%20GFINDER%20Findings%20%E2%80%93%20Funding

PDPs typically focus on all the stages of vaccine development. PDPs employ a portfolio-based strategy (Grace 2010) through the identification of multiple promising vaccine compounds at different stages of vaccine development. This not only increases the likelihood of success but also minimizes technical and financial risk if some promising compounds fail during more advanced development stages. PDPs also seek to build developing world vaccine development capacity and establish regional offices to improve clinical access and the cultural sensitivity of their operations.

As shown in Table 2, PDPs differ in terms of their disease focus with some organizations focusing on individual diseases (e.g., IAVI, TBVI, TB Alliance) while others targeting multiple diseases (e.g., DNDi, FIND, IDRI). PDPs also differ in terms of the type of final product. While most PDPs focus on vaccine development, some PDPs focus on other aspects of diseases control (e.g., CONRAD and IVCC focus on disease or vector transmission).

In terms of internal management, PDPs are generally lean organizations employing various corporate management strategies to limit overhead costs and enable quick adaptive decision-making mandated by an unpredictable policy environment. Figure 1 presents a process representation of the PDP model.

## Impact

While, given the long time lines required to develop efficacious vaccines (generally 10–20 years), it is too early to assess the impact of PDPs; early results are promising. For example, between 2009 and 2013, more than half of the new vaccine products approved for tropical diseases were produced by PDPs (Cohen et al. 2014). According to other estimates (Breitstein and Spigelman 2013), more than 400 promising PDP-funded vaccines are currently in development. *MenAfriVac*, a vaccine developed by the PDP, Program for Appropriate Technology in Health (PATH), has been used to prevent meningitis among more than 200 million people globally. Further, multiple PDPs are working together to, for example, accelerate the development of TB vaccines through a process called Critical Path to TB Drug Regimens (CPTR) (Hayter and Nisar 2016).

PDPs also focus on various stages of vaccine development, not only the development of vaccine compounds and their manufacture. For example, the PDP Global Alliance for Vaccines and Immunization (GAVI) was established to guarantee bulk purchases for vaccine producers. This mechanism guarantees that vaccines producers will have a market large enough to cover their costs and effectively reduces the cost of individual

**Product Development Partnerships: Collaborative Multi-sector Regimes to Accelerate Vaccine Development, Fig. 1** A process representation of the PDP model

vaccine doses. GAVI has been instrumental in the distribution of PDP-developed vaccines such as *MenAfriVac* to the poorest regions of Africa (Bishai et al. 2011).

## Evolution

PDPs were originally established as independent, stand-alone organizations focused on one specific disease targets. PDPs often created their own policies and competed with other PDPs for scarce funding. However, as the collaborative vaccine development model matures, PDPs are increasingly collaborating with other PDPs to identify areas of common interest and take advantage of potential synergies. For example, in 2008, multiple PDPs to form the PDP access group the intention of which is to share best practices, resources, and expertise to further accelerate vaccine development for neglected tropical diseases (Hayter and Nisar 2016). Similarly, many PDPs have entered into formal bilateral collaborative agreements to enhance the overall efficiency of their vaccine development operations. Further, individual PDPs are expanding and/or shifting their goals in order to reflect the changing nature of the target disease, as is the case with IAVI and AIDS, or expand their focus to additional, related diseases as is the case with the Human Hookworm Vaccine Initiative (HHVI).

## Challenges

The PDP model, despite its promise, continues to face challenges related to its sustainability, accountability, and impact. Most PDPs are almost entirely dependent on donors, especially BMGF, to sustain their operations. Thus, a change in donor priorities, global financial recession, or unexpected financial requirements pose an ever-present threat to the existence of PDPs. It is for this reason that financial sustainability poses the greatest challenges to the PDP vaccine development model (Hayter and Nisar 2016).

There also exist important legal and organizational hurdles around the collaborative agreements that constitute the PDP model. For example, intellectual property policies, increased industrial involvement, and the limited capacity of developing country partners are especially important challenges. Due to their transnational, nonprofit status, critics question the extent to which PDPs are accountable for public funds granted by individual governmental agencies. Similarly, due to the long-term nature of vaccine development and lack of known viable alternatives, the impacts of PDPs have yet to be fully understood; systematic evaluations of PDP efficacy may hold promise (Hayter and Nisar 2016). How PDPs respond to these emerging challenges will determine the extent to which the PDP vaccine development model can evolve or, alternatively, may eventually be replaced by another arrangement, such as direct funding by private, nonprofit, and governmental donors to private pharmaceutical companies or perhaps nothing at all.

In an increasingly interconnected world, where individual countries or sectors are seldom in a position to solve complex policy problems, the PDP model – despite its limitations – is a good illustration of the potential offered by collaborative governance to tackle major policy problems facing the world today.

# Productivity and Management in Public Sector

Lois M. Warner
School of Public Affairs and Administration, Rutgers, The State University of New Jersey, Newark, NJ, USA

## Synonyms

Effectiveness; Efficiency; Performance

## Definition

To be productive is to have the capability and capacity to achieve targeted goals, such as the production of goods and services in response to consumer demand. The word productivity is used to describe the relationship between what is produced, in terms of goods or services, and the resources used in the processes of producing them. Goods and services are normally referred to as outputs, and the resources used to produce them are known as inputs. Productivity is calculated based on the ratio of output to input: units of output per units of input. Ideally, effective public management requires that inputs do not continuously exceed outputs in production processes. The general intent is to economically maximize outputs, based on the efficient management of resources.

## Introduction

Productivity in public management demonstrates competence in the use of resources, such as taxes, facilities, labor, and time, for creating and distributing goods and services, and the impact achieved. Productive public organizations accomplish their mandates and meet public expectations. Their leaders understand what makes government productive and effective. But, a wide range of factors influence public productivity, because the public sector is complex and encompasses many different types of production processes. So, there is no simple answer to this question. Certain factors, however, such as work processes, workers' skills and motivation, management techniques, the introduction of technology, and organizational environments continue to be associated with productivity improvement and are impactful in various types of organizations and in other sectors as well. There are also factors that continue to deter productivity, such as political influence in decision-making, the lack of clear objectives, inflexible bureaucracies and fragmented authority (also known as "red tape"), the lack of accountability, and inadequate performance evaluation. These are also important for public managers to understand, so that they can find ways to control them. Understanding which factors drive or deter productivity enables public managers to address related issues in order to achieve success in their organizations.

## Productivity Drivers

Work processes, workers' skills and motivation, management, the introduction of technology (Rosen 1984), and organizational environments continue to be avenues for improving productivity. Changes in management, especially in knowledge, attitudes, and behavior, lead to better understanding of how to obtain and use productivity measures. This supports more accurate evaluation of public organizations (Rosen 1984). Overall, technology is a major driver of productivity by accelerating and standardizing work processes, expanding capacity, increasing access to information, and supporting knowledge building in the field of public management. In the last three decades, information and communications technologies (ICTs) have transformed work environments and favorably impacted productivity.

Employee training is an ongoing necessity for developing required skills and for maintaining employees' technological competence, given the continuous innovations in ICT development. Such programs are beneficial investments over time and contribute to increasing the responsiveness of public organizations to the needs and concerns of citizens by enabling closer connection between citizens and appointed and elected officials in governments and also through facilitating networks between departments of government and links between employees at various levels and occupations in the public sector. Closer contact between those who serve, with the people they serve, allows public sector employees to be better informed about public needs and concerns and, therefore, more responsive. Citizens expect that their government's agencies will be fair, responsive, open, and accountable (Rainey 2014). Public productivity assessments must take into consideration their efficiency in organizing public programs but also the effectiveness of each program. It is important that programs are appropriate, as well as cost effective.

Public organizations become more efficient when they adapt to ICTs as an integral part of their operations. ICTs enable them to prioritize their activities accordingly, as well as to accommodate feedback and include it in their decision-making processes when determining what developments are required for them to contribute to the quality of life of citizens. The use of ICTs also allows public employees to share, exchange, and distribute information among public organizations locally and regionally, increasing the possibility of greater speed and thoroughness in decision-making processes. Management that is "connected" can more readily contribute to productivity improvements when doing so from informed standpoints. These methods can be used to reduce the need for incremental approaches when developing public programs.

Employee motivation is a driver of productivity that has received a lot of attention. Public managers need to know what inspires and energizes workers in order to help them increase their outputs. Many studies have found that workers in public organizations have different sources of inspiration than those working in private businesses. Indeed, there are some incentives that employees everywhere respond to, such as job security and adequate remuneration, but public employees are comparatively more motivated by their commitment to serving the public, the desire to do meaningful work for the benefit of their communities, and an interest in public policy development and implementation. Organizations that value feedback from employees get a better sense of the specific motivational factors that are relevant in different organizational settings.

In addition to work processes, workers' skills and motivation, and managerial and technological interventions, organizational environments drive productivity. Practices and processes for the production of public goods and services are conducted in and through organizations, and certain organizational features can enhance productivity. Organizational communications processes that are improved by ICTs support standard operating procedures, customization of administrative responses to public request, and enhancement of record keeping and retrieval, due to the storage capacity and search features in ICT systems. Systematic comparisons and cross-referencing provide ongoing learning opportunities. Indeed, technology brings order to organizational environments and supports the execution of more

timely administrative procedures, all of which contribute to improving public productivity.

Successful public organizations strive to foster and maintain work place environments that are cooperative and free of conflicts and tensions among employees. Occupational safety is an important area for managerial concern. In many countries, safety requirements are clearly documented with related mechanisms in place to monitor compliance. Safe and cooperative organizational environments help to inhibit some of the barriers to productivity.

## Productivity Barriers

Political influence, ambiguous objectives, bureaucratic inflexibility, fragmented authority, lack of accountability, and inadequate performance evaluation have all been frequently identified as barriers to public productivity. Public organizations have a long history of dealing with the challenges of political influence. Political decision-makers determine the mandates of public organizations and approve budgetary allocations for their programs. Budgetary priorities differ across political parties, and changes in government leadership can result in changes in funding for public programs. Political candidates often promise to cut taxes while increasing or improving services. (This is equivalent to cutting resources, while at the same time increasing or improving outputs.) There is also a tendency to take election cycles into consideration when determining funding priorities and time frames. These developments can impair public sector productivity and effectiveness in program delivery. A common mantra among public employees is the challenge of having to "do more with less." Achieving better results with fewer resources is a challenge often faced by public organizations. When this leads to innovation, the results are commendable, but there is resistance to innovation because it can be experimental and time-consuming, with the possibility of wasting resources. Furthermore, there tends to be inadequate support for research development and experimentation in many important areas of public management.

Ambiguous objectives deter goal achievement. Public policy directives can be "lofty" without clear targets and specified indicators of achievement. Consequently, government agencies face difficulties in designing programs that are focused on achieving success. The following are examples of this: "to ensure public safety," "to improve public education," or "to enhance recreational opportunities." Precise, quantifiable objectives are missing in these broad terms. Public productivity has been measured, for example, along the lines of the number of calls answered, cases processed, and applications received. Such data is informative regarding the demand for services, more so than organizational success in catering to those demands. The emphasis here is on quantity, with neither assessment of the quality and effectiveness of service rendered, nor of public satisfaction. Quality must be a component in productivity assessment if the waste of resources is to be controlled.

The structure of public organizations within political frameworks involves fragmented lines of authority within a bureaucratic hierarchy. Approvals and decision-making processes are consequently rigid, and, although they are aimed toward maintaining central control and preventing deviations in programs and service delivery, inflexible multifaceted methods rely heavily on rules, regulations, and detailed procedures (Ammons 1984) that result in delayed responses and reductions in productivity. Accountability has been directed primarily toward political decision-makers and supervisors, along the chain of command within departments of government. Public sector reformers continue to address bureaucratic rigidity and cutting the "red tape," and these inflexible processes are often referred to as their primary intent. Decentralization of decision-making is a major approach aimed to reduce delays.

Lack of accountability to the public clouds managerial awareness of productivity levels. When accountability is internally focused in the organization, working within inadequate budgets and with limited resources, management can become preoccupied with trying to keep their operations running. When expectations focus more on efficiency, accountability remains at a

low level, but with increasing public awareness and their demand for greater accountability, public organizations become more accountable for their effectiveness. This calls for more attention to results-based management rather than reliance placed simply on output-input productivity measures. Although the concept of productivity has been utilized for many years, it is often simplified and misapplied. Performance measurement facilitates a more accurate assessment of productivity and impact, as well as a more attractive path toward improving productivity (Holzer and Seok-Hwan 2004).

## Public Performance Measurement

The public sector funds programs and delivers goods and services in the interest of the public. They must constantly be searching for ways to improve service to their communities. A major concern is how to make better use of allocated tax revenues. With this in mind, in measuring productivity, program outcomes and their impact become important indicators of organizational success. Performance measurement provides more clarity about what is actually provided, not what is produced. It must focus on more than just outputs and attempt to understand outcomes (Shark 2015). Performance, as a measure of organizational success, has been a major focus in the assessment and management of public sector progress in the new millennium.

At least two main stages are involved in utilizing performance measurement information. First is adoption (development of measures) and secondly, their implementation (actual use). These measures assist public managers in supporting the use of performance measures more effectively (de Lancer Julnes and Holzer 2001). An additional series of steps also affects the use of performance measures. These include assessing the organization's readiness to develop and implement performance measures, identifying and involving the organization's internal and external interest groups, involving employee unions, emphasizing the need for the organization to develop a "performance improvement culture," and supporting the adaptation of performance measures in a short period of time. The awareness and culture that the adaptation of performance measures can create may help to improve the chances of implementing performance measurement in due course. Political and management support are also important to adopting and implementing performance measurement as a process of assessing organizations' success (de Lancer Julnes and Holzer 2001).

The involvement of external stakeholders in performance measurement provides a more objective look at public organizations. Self-reporting can be self-serving. When citizens participate, it allows the public to ask questions and to select the measures and methods to be used. The effect is greater acceptance and appreciation of the results and more confidence that bureaucracies are making prudent use of tax-funded resources (Halachmi and Holzer 2010). Citizens' participation also provides an avenue for better representation of all elements of society and more inclusive decision-making regarding issues that affect the lives of entire communities. Citizens' participation also promotes transparency and accountability, in particular, and may facilitate better efficiency, legitimacy, public cooperation, and trust (Halachmi and Holzer 2010).

Technological developments and the adaptation of certain ICTs in public organizations make it possible for citizens to participate in measuring and assessing the performance of public organizations. This practice can be enhanced when there is actual legislation in place to support it. The Freedom of Information Act (FOIA) is an important example. With free access to public information, citizens can update themselves about public policies and programs being created for implementing them. Public agencies must also initiate consultation with citizens to facilitate feedback on issues that might concern them and engage them more integrally and interactively in decision-making processes. Across world regions, 62% of the United Nations member states recognize citizens' rights to access public information. This is a constitutional right and is regulated through the promulgation of FOIA (United Nations 2015). In most cases, FOIA includes

provisions for appeals and specific time frames for providing access to information.

## Conclusion

Major aspects of productivity management in the public sector are first, the recognition that output-input measures are limited in determining the success of public organizations' effectiveness in implementing public policy. It once prevailed as the method public organizations as well as in private businesses used to assess levels of productivity. It became recognized as more appropriate for private businesses seeking to calculate and retain their profit margins. As citizen orientation became a more important value, this form of productivity analysis proved to be devoid in providing useful information on which public organizations could plan for improvements. Citizens' satisfaction is associated with their willingness to pay taxes, which makes their satisfaction a priority in evaluating the productivity and performance of public organizations.

Secondly, during the past 50 years, public administration and management researchers and practitioners in many countries have been dedicated to addressing the challenges for public sector reform, with strategies for productivity improvements. As a result, the study of public productivity has become geared more toward measuring the performance of public programs that are designed for implementing public policies. It has proven to offer better indicators of effective management. A third important aspect is technological development that can ameliorate the challenge of large and often unmanageable workloads. Traditionally, these conditions characterized government agencies and contributed to their inefficiency. Technology continues to improve productivity by enabling better time management and facilitating direct communication with both internal and external stakeholders. Above all, ICTs have helped to increase government-to-citizen connectivity, so that citizen satisfaction can be surveyed and addressed with appropriate responses to demonstrate that their governments are being accountable and responsive.

## Introduction

Management literature has long taken for granted that well-motivated employees perform better than other employees. Thus, motivated employees naturally increase the productivity and profitability of companies. Similarly, job satisfaction and motivation have been considered to go hand in hand.

The issue has also been clarified in academic research. Researchers have sought an explanation in many industries for how motivation increases employee productivity, and which factors increase job motivation and/or job satisfaction. Factors that influence motivation and job satisfaction include: job diversity, job identity, job relevance, job independence, different rewards, and management feedback. In order for management to provide fair feedback, the employee must also have clear goals against which to perform and which the employee has internalized. In addition, leadership has been seen as a key contributor to good motivation. Further, studies have found a causal link between sick leave and work motivation, which has a direct impact on company productivity.

Mayo (1946) studied labor productivity already in the 1940s. Perhaps his most important observation was that workplace conditions did not in themselves affect productivity. More important was whether or not someone paid attention to the employees. The symptom was that, even though the working environment was being weakened, labor productivity increased as long as sufficient attention was paid to the workers.

Public services are tasks decided by the parliament or municipalities and are produced within the budgets provided by tax funds. Measuring the productivity of these services is often problematic. In principle the measurement is to be made, but the determination of the right types of indicators, however, is very difficult.

The public sector has started to pay more attention to productivity and employee motivation. This development has been influenced by many factors, including the shift in work in society as digitalization and the use of new tools become more widespread. Developments have been accelerated by the difficulties of public finances following the economic crises of the 1990s and 2000s. At present, there is particular pressure on the availability of labor for public administration as the population ages and fertility rates decline.

In the public sector, the search for efficiency has begun by learning about private sector actors. This trend was called the New Public Management (NPM) in the 1990s. In the literature, NPM has been characterized e.g. related issues measurement of work performance, responsibility for work performance, strategic planning and leadership, and changes in leadership style and human resource management (incentive implementation). New technologies like social media and new ideas like personal incentives have put extra pressure on for heads of agencies. These new tools have been eagerly provided by commercial consultants, who have also used terminology that old school leaders have found difficult to understand. They felt that the new tools outweighed the services provided by the agencies. Similarly, wondering has been caused by the forgetting or rejection of old tools.

For example, in Finland in 2003, the government launched a productivity program to increase productivity by reducing staffing and increasing e-services in government. This project did not fully meet expectations. In part, this was because employees were already working at the limits of their performance when the project started and were no longer able to meet new output or productivity requirements. They simply overloaded with new demands. The project focused too much on measuring the success of different projects, rather than measuring the productivity of public services. From the outside view, it seems that the tail had begun to swing the dog.

Recognizing the connection between job satisfaction and motivation for job performance, various agencies have also begun to pay attention to staff motivation and well-being at work. Studies have investigated whether there are differences between the private and public sectors in how to

motivate staff in their work. A further challenge is the fact that people of different ages (generations) seem to have big differences in what motivates them to work.

## Development of Management Paradigms

The history of management can be viewed through various management paradigms. This has been done by, e.g., Sibbet and The Staff of Harvard Business Review (1997) and later Kuokkanen et al. (2010), whose viewpoint slightly differed from Sibbet's classification. Kuokkanen's research group grouped management paradigms as follows: scientific management, human relation theories, structural analysis, organizational culture, and the innovation paradigm (Fig. 1).

*Scientific management* (Taylorism) is based on accurate analysis and measurement of working processes and tasks. Scientific research methods identified best practices for performing different tasks. These practices were implemented in various company operations. Thereafter, operations were regularly measured.

According to *Human relation theories* (Mayo 1946), employee performance was influenced not only by working conditions but also by taking into account the social needs of employees. The management had to be able to, among other things, increase collaboration and interaction between employees.

*Structural analysis* broadened the concept of a company. According to it, it was also essential to look at the environment of the company and the changes in it. It was no longer enough for the company to be seen as an independent entity. Based on structural analyzes, Hamel and Prahaland (1990) and Porter (1980) developed tools for analyzing the strategic dimensions of companies.

*The paradigm of organizational culture* assumes that every company has its own culture that management must strengthen and further develop. Corporate culture determines how a company operates. A good corporate culture is based on strong values, taking into account the employees and is one that competitors cannot easily copy. The Japanese working culture is a good example of a working corporate culture.

*Innovation paradigm* is based on the view that society is undergoing constant structural change. In this case, employees must be able to develop as individuals and as members of the group so that they can use their skills to support the new company's success and growth. Innovation is seen as an important way to create new business and can only be achieved if employees are willing to develop their own skills.

In addition to the management paradigms presented above, business organizations have been studied for decades. Researchers have determined what kind of organization suits what purpose Waterman et al. (1980) and Galbraith et al. (2002). Further research has focused on management systems and methods to determine the right

**Productivity Methods in Public Sector, Fig. 1** Timeline of some key management paradigms (The Staff of Harvard Business Review 1997)

visions for companies, as well as the goals that support the strategy and how those goals can be achieved by Kaplan and Norton (1992).

## New Public Management

New management paradigms, in the public sector, have replaced old practices such as Taylor's policy management, Weber's bureaucracy, and Wilson's policy-administration divide. To replace them, New Public Management (NPM) has been created. The main reasons for abandoning the old management paradigms and the birth of NPM were pressures from the development of the surrounding society, as described in the introduction. NPM aims to increase administrative transparency and market orientation. In addition, management practices such as LEAN in the private sector were also found to be attractive in the provision of public services. Table 1 presents the key elements of the NMP, following the categorization proposed by Diefenbach (2009).

**Productivity Methods in Public Sector, Table 1** Key elements of NPM, Diefenbach (2009)

| Area | Element |
|---|---|
| 1. Business environment and strategic objectives | Cost reduction, privatization<br>Changing business environment<br>Customer and market orientation |
| 2. Organizational structures and processes | Decentralization and reorganization<br>Concentration on processes, standardization |
| 3. Performance management and measurement system | Performance indicators, explicit targets<br>Productivity and quality<br>Higher performance and motivation |
| 4. Management and managers | Management culture<br>New types of management positions |
| 5. Employees and corporate culture | Empowerment and subsidiarity<br>Business-like attitude |

Similar categorizations have been proposed by numerous other researchers in the 1990s and 2000s.

## Practice and Performance

Organizations are influenced by a variety of practices that are hoped to lead to the best possible performance, and Voss et al. (1995) have also proved such a practice-performance relationship. In their studies, best practices were represented by employee training, the company's long-term vision and shared values. As performance indicators, they used lead times, quality, employee morale, etc. Although these practices and performance indicators are commonly used, Kuula et al. (2012) recall that their use resembles the bell curve, whereby the use of certain practices and/or indicators initially increases in a particular industry, reaching a maximum at some point, and their use begins to decrease correspondingly after that culmination point as new practices and/or indicators replace it.

How then do different management tools and techniques improve the performance of the company? Unfortunately, studies (e.g., Nohria et al. 2003) have found no evidence that the use of such tools and techniques has resulted in a competitive advantage over other companies. However, according to them, "four primary management practices": strategy, execution, culture, and structure (Table 2).

## Motivation

Motivation and its factors have been studied for a long time. What are the factors that drive people to do things and, on the other hand, how to get more out of an employee without burdening them too much? In 1964, Hertzberg published his theory of the content of the work – two-factor theory – that had two parts: hygiene factors and motivational factors. Hygiene factors are things that need to be in order – they are the so-called on-off factors – and if they are not at worst an employee leaves the organization. Either they are okay or not – enough

**Productivity Methods in Public Sector, Table 2** Primary management practices. (Modified from Nohria et al. 2003)

| Primary Management Practices | | |
|---|---|---|
| *Strategy* | Define sharply<br>Communicate clearly | Based on the value proposition to the customers<br>Continuously fine-tune the strategy based on changes<br>Clear communication to all parties<br>Keep focused |
| *Execution* | Develop and maintain flawless operations | Delight the customers consistently<br>Decision making authority close to the front-line<br>Constantly strive to eliminate all the waste, improve productivity |
| *Culture* | Holding high expectation of performance | Inspire all to do their best<br>Empower employees and managers to do improvements in operations<br>Reward achievement with pay based performance but keep raising the bar<br>Create challenging and satisfying environment<br>Establish and abide by clear company values |
| *Structure* | Reduce bureaucracy and simplify work | Simplify<br>Promote cooperation and exchange of information across the organization<br>Best people closest to the action<br>Establish systems for seamless sharing of knowledge |

okay is enough. Motivational factors, on the other hand, are factors that make employees do more and better work. Typical motivational factors are getting feedback, appreciation, and job content, while hygiene factors include safety, relationships, and money.

Another major motivation theory is Maslow's hierarchy of needs. In it, Maslow describes human needs in a five-step system (physiological needs, safety, love / belonging, esteem, and self-actualization). According to the theory, the upper level cannot be reached unless the lower level is sufficiently enough satisfied. Herzberg's two-factor theory and Maslow's hierarchy of needs are the basis of many of the latest theories of motivation and, on the other hand, they are interrelated. Hygiene factors are typically the lowest three levels of the needs hierarchy and motivational factors are the top two levels. The starting point for working better is the meaningfulness of the work and the achievement of the goals. Often people also are confused with the concepts of expanding and enriching the image of the work, which mean different things. The latter leads to improved motivation and action while the former may rather lead to burnout.

You do not always even have to motivate employees. In many times, it is just enough not to demotivate them. Especially in expert and high-level positions, the work itself is already sufficiently motivating and the expert does not need motivation from the supervisor if the content and goals of the work are set correctly. The worst thing in this case may be the supervisor's excessive interference in things so-called micromanagement and excessive control, which can deprive the expert of motivation. In this case, the supervisor demotivates his subordinate and the subordinate may respond with the only means he has at his disposal, i.e., by doing just the required amount of work, but no more. An employee often only needs achievement, community and equality in his or her job and working conditions (Table 3).

The Job Demand-Resources model (JDR) describes very clearly what motivation and achievement are all about (Fig. 2). Factors influencing the outcome of an organization have been extensively studied, but usually as a correlation of two or three factors, e.g., motivation and outcome, working conditions and motivation, etc.…. The JDR model has combined many of these issues and made the effectiveness of the factors well visible, both negative factors such as pressure and stress as well as positive factors such as resources provided, support, and feedback.

**Productivity Methods in Public Sector, Table 3** How to fulfil the drives that motivate employees (Nohria et al. 2008)

| Drive | Primary Lever | Actions |
|---|---|---|
| *Acquire* | Reward system | Sharply differentiate good performers and poor performers<br>Tie rewards clearly to performance<br>Pay as well as your competitors |
| *Bond* | Culture | Foster mutual reliance and friendship among co-workers<br>Value collaboration and teamwork<br>Encourage sharing of best practices |
| *Comprehend* | Job design | Design jobs that have distinct and important roles in the organization<br>Design jobs that are meaningful and foster a sense of contribution to the organization |
| *Defend* | Performance-management and Resource-Allocation Processes | Increase the transparency of all processes<br>Emphasize their fairness<br>Build trust by being just and transparent in granting rewards, assignments and other forms of recognition |

**Productivity Methods in Public Sector, Fig. 2** Job Demand-Resources model (Bakker and Demerouti 2007)

Kuula et al. (2012) reached a similar result in their own research in public administration. The key factor in improving work results and motivation was clarifying the purpose of the organization's existence and how different people can influence it with their own activities and what their role is as a whole. Once the tasks and their own playground were clear, employees were better able to manage their own workload, work pressure, and to participate better in the development of their work, starting with the clarification of processes and responsibilities.

**The Actions Taken Were Clear**:

- **Communicating the mission of the organization**
- **Giving individual performance targets**
- **Monitoring the development**

- **Early and immediate involvement in differences**
- **Right tools for the employees**
- **Analyzing the reasons for low output**
- **LEAN type of operations**
- **Removing distracting circumstances (e.g., Facebook and other social media, which were not part of individuals' work)**.

As stated at the beginning, the new public management idea brings good established private models and methods to public administration. The latest business development model imported from private sector and especially from manufacturing industry is the widespread use of lean thinking.

It has often been criticized for its original origin at Toyota production lines and thus the critics claim it is not suitable for service industry or public sector as such. However, it has several levels, the most important of which is the philosophical level. The main goal is to use resources for essentials and not to waste. An idea that fits all organizations and activities. Focus is on the essential. Of course, it is not always easy to find or become aware of its essentials. Moreover, especially in the public sector, this may change quite rapidly due to political situation.

Lean operations start from finding and eliminating the wastes. These wastes were originally (the so-called seven wastes)

- Unnecessary stocks
- Unnecessary transport
- Unnecessary movements
- Overproduction
- Over-processing
- Low quality
- Unnecessary waiting

The eighth waste mentioned is doing work with the wrong or too expensive tool / person or resources.

There are several tools used in lean improvements, perhaps the most significant of which is the so-called 5S model. 5S comes from the words sort, standardize, systemize, shine, and sustain. Things are done systematically, reducing errors and their potential, which brings productivity. You do not have to run faster but do things more sensibly and focus on the essentials. Other good tools for almost every situation are 5 x why, root cause analysis, and, of course, Deming's plan to check act model.

## Discussion

Communication plays a significant role in improving operations and results. When employees are clearly communicated what the goal of the organization and operations is, then it is easier for them to participate in the activities and their development, and they are more commitment to the goals.

Once organizational goals are communicated and understood, even employees' personal goals are easier to understand and discuss together their causes and effects. This in turn makes it easier to monitor actions and results in consensus and corrective action is easier to accept and understand.

Much has been discussed, and there is talk about how a new generation – millennials – should be guided to lead. The world of work has become much more hectic, more information is available, and people are even available 24/7, which is both a good thing and a bad thing. There is constant pressure from management to do more things faster without sacrificing quality, which is almost impossible.

What to invest in to achieve the best possible outcome? Very often, it is about the chicken and egg setup – which comes first: a satisfied employee or motivation. Of course, a lazily managed organization can lead to satisfied employees, but not to the main result, and on the other hand, as soon as you start demanding again, the satisfaction ends when conditions deteriorate, i.e., the so-called "Laissez-faire" management does not work.

The Galbraith star model is a very good tool for developing an organization's operations. It is easy to understand and communicate and at the same time, you find things that "rubbing" an organization's operations that are typically conflicting goals or processes that do not support the achievement of the overall goal.

## Conclusion

Many studies have found and investigated the link between job satisfaction and motivation. However, this does not always bring better results to the organization. Increasing satisfaction does provide better motivation, but it can stay that way. However, motivation or job satisfaction alone are not the ultimate goals of an organization.

# Professional and Business Associations

Ekaterina Ivanova
Faculty of Business and Management, National Research University – Higher School of Economics, Moscow, Russia

## Synonyms

Interest groups; Mutual benefit and membership based nonprofit organizations; Societies; Unions

## Definition

Professional and business associations are formally established membership organizations – that work to promote, regulate and protect the interests of professional groups (e.g., occupational associations in culture, healthcare, science and education), special sectors of business (e.g., business and trade associations in real sector of economy and services) and multiple sectors of business (e.g., cross-sectoral umbrella associations supporting business and entrepreneurship). As any nonprofit organization professional and business associations are multifunctional, providing members simultaneously with services, advocating for their interests and building them as a community. Membership in professional and business associations varies from individual to collective, or both, and could be voluntary or compulsory, depending on national regulation or self-regulation traditions.

## Introduction

In this entry, the origins of associations as a concept and its particular type – professional and

business associations – are discussed. The development of this type of associations in various national contexts is then discussed as highlighted in the research literature. An overview is provided of three central functions that professional and business associations simultaneously perform – advocacy, service delivery and community building – for making a meaningful contribution to public management, market and society. As researchers and practitioners have struggled with a complex nature of activities performed by associations, recognition has emerged that professional and business associations serve as a viable societal infrastructure necessary for sustainable development.

## Associations as Nonprofit Organizations

Nonprofit membership associations, being a significant subset of the nonprofit sector play important roles across different societies (Freise and Hallmann 2014). Associations serve as a forum for discussions and coordination of common interests among full-fledged members, and they also provide vital horizontal and vertical links between different parts of society. In other words, according to Anheier (2005, p. 61) the function of voluntary associations "is to serve both as a cohesive device for members with similar interests and as an inclusive mechanism by being open to different segments and groups of the community". At the same time, associations' impact on society could be ambivalent, ranging from negative exclusive to positive inclusive effects of associating.

The most important distinctive feature of nonprofit membership associations studies is that there is no single discipline that examines them comprehensively, rather a patchwork understanding is prevailing based on dominant perspectives in sociology, political science, law or organization studies. For instance, political scientists claim that today "the diversity of associations is the institutionalized core of civil societies", which guarantees "the democratic commonwealth" (Freise and Hallmann 2014, p. 2). Given such a cross-disciplinary and multi-dimensional nature of the literature on associations and their varied meaning in different nation states it comes as no wonder that there is no one ideal typology of associations in use. One of the categorizations of associations was developed Warren (2001), who distinguished between the thickness and thinness of associative relations. He differentiates between primary associations, constituted from families and friendships, secondary associations that are made up of close social attachments in the living environment (e.g., leisure clubs, self-help groups), and tertiary associations, whose members apart from sharing the purpose of uniting have little in common (e.g., professional and business associations).

## Professional Associations

In the Western academic tradition, under professional associations, one normally understands NPOs, which were created in order to independently promote, regulate and protect interests in certain professional fields (Anheier 2005). As Chua and Poullaos (1998, p. 156) argue, the neo-Weberian notion of "social closure" or "market closure," as opposed to critical frameworks of Marx and Foucault, remains a mainstream theoretical basis for the empirical analysis of professionalization projects. Theory of market closure "focuses on how members of an interest group seek market dominance by monopolizing social and economic opportunities and closing off opportunities to outsiders" (Chua and Poullaos 1998, p. 156). In other words, as researchers have often pointed out (Abbott 2007), the self-interested rationale of occupations lays in their striving to achieve professional status, manifested in their collective actions to introduce entry barriers to the profession. Occupations follow such strategies not only to cut off rival interest groups, such as amateurs or charlatans, but more so to maximize their economic and political power, that allows them to keep and protect their occupational "havens" from the threats and fluctuations of a free market of services. Starting from the medieval cities of Europe professionals have traditionally gained benefits of "social closure" from the unwanted similarly qualified immigrants, thus

keeping the number of members of professional corporations within desirable limits and protecting their earnings from a consequent depreciation. However, with the introduction of the progressive EU 1989 Directive 89/48/EEC on the mutual recognition of professional qualifications, professional bodies in the European member states are now prevented from exercising influence over labor markets, at least in theory.

Turning back to history shows that professionalization projects are implemented in two ways. Either in a bottom-up way, as in the liberal Anglo-Saxon countries, in which professional associations emerged from the horizontal voluntary interaction at the occupational level in order to achieve professional status. Or in a top-down manner, as in case of the continental European state-centric countries, such as Germany, where the state was actively involved hierarchically as an interventionist in the initial establishment, regulation and administration of professions in order to make labor markets rationalized and controlled. As a result of Neal and Morgan's (2000) comparative historical study of 19 professions in the UK and Germany, the scholars came up with two different models of professionalization, resulting from a systematic occupational project, "the spontaneous" self-interest guided model was characteristic of the insular UK and the "state-sanctioned" model was attributed to the continental Germany. In both cases, however, the mode of professionalization, expressed through the conditions for entry into the regulated field, the licensing procedure or an academic route to qualification, were negotiated between three major constituencies: the state, academia and the professional associations. But the roles professional associations played in two countries were different. In the UK, they were set up at an earlier stage of the professionalization process and remained responsible for professional education, thus the professions in the UK evolved predominantly on a self-regulatory basis. In Germany, professional associations, represented by a system of professional chambers, emerged at a later stage of the professionalization process, having only limited amount of self-regulation at their disposal, whereas the state remained responsible for professional education and admittance into the profession, therefore professions in Germany were largely state-regulated (Neal and Morgan 2000). Nevertheless, emergence of professional associations, as a legitimate body that represents interests of the respective communities, remains being a sign of a completed professionalization project in a given field, be it established professions, such as lawyers, accountants and medics, or newer professions in engineering, management or business services. What is more important to note is that the professional transparency directives of the European Union are written based upon the Germanic mode of professionalization. It means that the European super-state will continue to play a leading role in establishing new professions, such as that of "eco-auditor," in terms of setting the new regulatory and educational frameworks (Neal and Morgan 2000).

At the same time, statements of scholars on the end of "golden age" of the traditional professions and critical views on threats of "de-professionalization," caused by the hegemony of the economy in the modern world, are becoming more and more widespread (Moskovskaya et al. 2013). The old "collegial" model of professionalization, based on formal credentials that certify the mastery of a given body of knowledge, which has always been implemented within the national boundaries, is challenged by the new market-oriented "corporate" professionalization, which has been carried out from the very beginning by large multinational corporations in the context of globalization (Muzio et al. 2011). An a priori prerequisite for the professionalization of the canonical professions was the formal codifiable body of knowledge, which was regulated and controlled via such mechanism, as educational institutions and state licensing and protected by ideology stated in the professional codes of ethics, enforced by a particular professional association (Torres 1991). In case of the new knowledge-based corporate professions, such as management consultants, project managers or executive head-hunters, the body of knowledge consists to a certain degree of codifiable technical knowledge and to a large degree of uncodifiable practical knowledge, which is always contingent to time, place and

personal characteristics of a professional. Accordingly, the reasons for acquiring legitimacy are different in each model; in case of traditional professions they came down to the public benefit factor, expressed in claims to public service and the social trusteeship of key competencies, whereas in the new professions legitimacy stems from purely commercial claims and market value that they create (Muzio et al. 2011). Finally, the role of professional associations is diminishing in the new market-oriented professions, in which they are restricted in influence in comparison to bearing responsibility for ideals and professional control, as it was common for the traditional professions (Moskovskaya et al. 2013).

In case of transitional economies, such as Russia, as it is outlined in the explorative study of professional associations by Moskovskaya's team (2013) the professionalization projects in the high status occupations are far from being completed in any one of professions, which are found at different stages of struggle for their professional status. Given the omnipresence of the state in the public sphere throughout the Russian history it becomes apparent to conclude that Moscow-led mode of professionalization will rather follow the German pattern than the Anglo-Saxon one, meaning that the role of the Russian professional associations is far less important than that of the state. In this respect it is self-evident that according to Moskovskaya et al. (2013) self-regulation mechanisms used by the Russian professional associations are still at the embryonic stage of development, what shows that it is the state and not professional associations, who decides which professions should be regulated. Contrary to the institutionalized professions in the West, Russia finds itself in a unique historical moment, in which professionalization projects are still at the very early stages of attaining their professional status, given the still lacking social embeddedness of professions in Russia.

## Business Associations

Business associations or trade associations, as they are often referred to alternatively, operate under the premise of promoting the collectively shared interests of their members (Barnett 2013). Trade associations are created by the companies of the same sector "to collect and disseminate trade information, offer legal and technical advice, furnish industry-related training, and provide a platform for collective lobbying", as well as to provide services, organize annual meetings and events for members (Barringer and Harrison 2000, pp. 392–393). The typical model of governance of business associations represents a combination of a paid workforce and a voluntary board (Barringer and Harrison 2000). In many respects business associations are similar to other mutual benefit membership organizations, such as professional associations discussed in the section above. Their activities resemble as they aim at restricting competition within their industry, act as gatekeepers within their issue area (Aldrich et al. 1994) and their advocacy activities "may generate positive spillover benefits even for those who are not members of the association" (Esparza et al. 2013, p. 3). Another similarity between professional and business associations acknowledged by scholars lies in the uneven distribution of power, which is concentrated in the hands of the most influential actors in the field (Barnett 2013), despite the common view of trade associations "as organizations that engage in collective action for mutual benefit of all industry members" (Esparza et al. 2013, p. 4). Moreover, many business associations just like professional associations do not only advocate for their interests in the face of the government, but also enjoy the privilege of self-regulation in their industry, thus supplementing or complementing direct regulation by the government (Gupta and Lad 1983).

According to Scott (2001, p. 118) professional and trade associations represent modern cases of the normative institutionalization of field practices, in which "normative standards may be explicitly established by self-appointed arbiters employing more or less representative bodies and deliberative procedures". Such a normative role prescribed to professional and business associations appears in varied scholarly accounts, which involve the processes of value setting

about the most preferred courses of action or establishment of standards (Esparza et al. 2013). Following Scotts' categories on three pillars of institutions (2001), apart from the central normative role, trade associations are also active in the regulative field through advocacy and interest representation activities, as well as in the cultural-cognitive field by reinforcing their collective identity and taken-for-grantedness. In their capacity of arbiters business associations possess the power to encourage the appropriate behavior of members in confirmation to the established standards, as well as to sanction those who does not confirm to them (Esparza et al. 2013). The intermediary position occupied by business associations between the state and industry contributes to the fact that their governance model is shaped by their environments by means of two oppositely directed logics: logic of membership and logic of influence (Aldrich et al. 1994). The logic of membership is coined by the diverse interests of the industry members and the need to coordinate them in order to aggregate competing interests into an effective action beneficial to all constituencies (Aldrich et al. 1994). Logic of influence concerns how business associations interact with the state and other industries (Aldrich et al. 1994). Both of these logics are intertwined, for instance, business associations that do not have strong connections with the state and cannot exercise influence upon it may compensate it by having stronger ties within their membership and better articulating their interests (Esparza et al. 2013).

In spite of the fact that there are thousands of business associations, representing almost every industry and their enormous potential impact, there is still little academic research devoted to this phenomenon on behalf of the organizational scholars (Barnett 2013; Barringer and Harrison 2000). A descriptive study on industry self-regulation put forward an argument that business associations are capable of introducing and enforcing industry standards, as well as product quality and safety guidelines, on the self-regulatory basis, which could serve as an alternative to state regulation (Gupta and Lad 1983). Among factors that drive companies' participation in a trade association researchers recognize reduction of uncertainty and augmenting industry legitimacy (Esparza et al. 2013). However, there are also drawbacks of associational activity. On the one hand, since there are almost no barriers to enter trade association, typically any company can join, what leads with a high probability to a free-rider problem, which means that a certain member could enjoy all the benefits that association produces on the same level with other members but with minimal contribution on own behalf. On the other hand, there is a risk of disclosing too much information for the essential needs of trade association in their information collection efforts, meaning that sensitive information on technologies, know-how or trade secrets will benefit competitors (Bresser 1988).

When looking at the emerging markets, the specifics of business association development in the post-Soviet Russia is the following. There are at least two different periods in the institutionalization of relations between the state and the private sector. The first one is linked to the Yeltsin presidency in the 1990s, which was marked by an emergence of a large number of professional and business associations. These NPOs were organized primarily around the personalities of their founders and their social capital inherited from the communist rule. Also, many of the former sector-specific "glavki" (central offices for industrial management) that were responsible for the strategic planning and supply activities in the planned economy were transformed into the new business associations. However, the public standing and influence of these organizations had been negligible. The second period starts with Putin's stepping in power in 2000. A turn in the construction of the societal model towards a traditional state dominant one was made. It appeared in the increased intervention of the state both in economy and public life. The latter became apparent particularly in the established "from above" state corporations, as well as in the all-Russian umbrella-type public chambers. The appearance of the power vertical in relations between the state and business became evident through the official state support of four cross-sectoral federal associations: the Chamber of Commerce and Industry and the

Russian Union of Industrialists and Entrepreneurs, Business Russia and "Opora Rossii." Each of these organizations was officially recognized as a consultation platform that represents interests of the large (the Chamber of Commerce and Industry and the Russian Union of Industrialists and Entrepreneurs), medium (Business Russia) and small (Opora Rossii) business respectively.

The state of empirical studies on business associations in Russia is similar to professional associations. The studies are scarce and driven primarily by economists and political scientists. Among the most comprehensive works on the Russian trade associations is the work of Yakovlev and co-authors (2010), which deserves special mentioning. These scholars managed to show the evolution of the role and place of business associations in the relations between the state and the private sector in the contemporary Russia. It should be highlighted that authors of this monograph were trying to refute the critical propositions of Olson (1982), who claimed that collective action of business inevitably brings harm to society and embeddedness of such groups of interests impedes economic growth. The formation of trade associations is higher in the industries, in which threat of overregulation exists, providing for the need of lobbying (Barringer and Harrison 2000). It is thus not surprising that in Russia companies of the competitive private-owned service sectors are more eager to unite, whereas the extractive, primarily, state-owned monopolists are less inclined to do so.

## Professional and Business Associations

According to the international classification of nonprofit organizations (Anheier, 2005, p. 55), professional and business associations constitute Group 11 "Business and professional associations, unions". In developed economies this type of nonprofit organizations provides employment for 4,8% of the total civil society workforce, while in transition and developing economies almost twice as many people (8,6%) are employed by professional and business associations (Salamon et al. 2004). The countries in which such associations generate the highest figures of employment in the nonprofit sector, according to Salamon et al. (2004), include Mexico (33,6%), Philippines (29,3%), Sweden (15,4%), Columbia (14,9%), Hungary (14%), Norway (13,1%) and Poland (10,8%). In all of these countries, professional and business associations rank third or fourth in terms of creating employment for nonprofit organizations, trailing only to culture, social services, as well as civic and advocacy activities.

In an empirical study of professional and business associations in Russia Ivanova (2015) distinguishes between business associations, intermediary unions and liberal professional societies that serve as an institutional infrastructure of civil society. Business associations unite representatives of the real sector of economy and professional service providers. Intermediary unions consist of the federated umbrella associations, all of which clearly identify themselves as multi-sector associations that encourage development of the national business and entrepreneurship. Liberal professional societies consolidate representatives of culture, healthcare, science and education. These professional and business associations are multi-functional, fulfilling simultaneously a composition of advocacy, service delivery and community building functions, as illustrated in the Table 1.

Thus, professional and business associations contributing not only to the political system, but also to the market and society at large are characterized by a pluralism of different logics, which represent a mix that effects simultaneously and should be constantly balanced. This multi-functional character of associations appeared considerably more distinct in case of the Russian associations in comparison with nonprofit organizations from developed economies. Such a difference could be due to the specific type of nonprofit organizations under investigation, represented by professional and business associations, in which multi-facetedness is one of its distinctive features, but also because of the emerging character of the Russian nonprofit sector, which is still young and less functionally specialized.

**Professional and Business Associations, Table 1** Functions of the Russian professional and business associations

| Function/ criterion | Advocacy | Service delivery | Community building |
|---|---|---|---|
| **Perspective** | Legal/communicative | Organizational | Normative |
| **Mission** | Socio-political | Socio-economic | Socio-cultural |
| **Addressee** | State, society | Members, society, (state – indirectly) | Members, society, (state – indirectly) |
| **Members' role** | Funders/opinion makers | Customers/inquirers | Networkers/status enhancers |

| **Output** | School of Democracy | Commercialization | Trust |

Source: Adopted with minor changes from Ivanova (2015)

## Conclusion

The concept of professional and business associations helps explain how societal infrastructure is developing in different contexts. The multifunctional nature of associations shows how they are contributing to political system, market and society.

# Professional City Management

Mark Benton
University of Missouri, Columbia, MO, USA

## Synonyms

Professional city administration; Urban management

## Introduction

Professional city management traces its roots to government reform in the early 1900s. This "good government" reform aimed to make government administration more professional, and more like business administration. The reform rose in response to widespread corruption in city governments. Although there are many important ways that government management is unlike business management, reform did lead to less corruption. The position of city manager has since professionalized and grown to encompass a wide variety of responsibilities.

City managers are responsible for running the day-to-day activities of municipal government, which include tasks as diverse as budgeting, public safety, streets, and parks and recreation. They are unelected government officials, and are usually hired by city councils. Because they are unelected government officials, city councils are tasked with holding them accountable for the sake of the public. Despite the tension between unelected officials and a democratic system of government, the expertise of professional city managers can prove valuable to cities that would otherwise have difficulty managing the variety of municipal services that citizens expect.

In recent years, the role of city manager has had to keep pace with changing trends in technology. These trends have necessitated updating government departments to use technology, creating opportunities for online service delivery, and has even allowed for more direct and inclusive citizen participation in government policies and practices. Although managers must take care not to use technology in a way that excludes people who do not use information communication technology, this "e-government" has the potential to make city management more democratically accountably, efficient, and effective.

## Early City Management

City manager is a profession that began in America, though other nations have adopted similar management models as the United States. This entry will discuss professional city management from the perspective of the United States. American cities in the 1800s were dependent on state governments that were largely concerned with rural interests, and were not usually able to receive state funding to finance very many municipal services. This meant that most municipal

improvements had to be financed locally by private interests (Wade 1996). The arrangement of needing private interests led to widespread and well-known corruption, where political favors were exchanged for agreements to finance municipal improvements and profit the politician (Steffens 1904).

In response to government corruption, reformers across the country called for government to become more professional, neutral, and accountable. This movement became known as the progressive movement, and also the good government movement. Notably, Woodrow Wilson called for more professional government in an 1887 essay "The Study of Administration." Wilson (1887) called for a separation of politics and administration, saying managers tasked with implementing laws should not be subject to the same concerns that politicians were because implementation was not a political job. Furthermore, Wilson called on government administration to be more like business administration. Making government more like a business entailed a professionally trained workforce, adopting business practices like budgeting, holding managers accountable to executive superiors, basing decisions on research and science, and focusing on efficiency.

Of course, there are many ways in which government administration is not like business administration. No business manager who wants to remain out of the public eye will still have as much exposure to public scrutiny as a government manager. A government manager must regularly interact with their public constituency, while a business manager can usually choose to stay out of the public eye. Governments don't have one typical goal of business, which is profit, and instead must measure their successes and failures in other ways. Usually this is the effectiveness or efficiency of service delivery. Government managers usually have less discretion in assigning additional monetary compensation for good performance than managers in the private sector. Business managers are often able to manage by giving orders, but because government administration is inevitable connected to politics and elections, the government manager must often be willing to make compromises. Finally, while a business must address the concerns of stakeholders, government must usually confront a larger body of the public.

Still, despite the differences between public management and private management, progressive good government reforms had a positive effect on professional city management. Today, city management has grown to be a profession in many cities. Many managers are highly trained and educated. More than 105 million people in the United States live in communities where city manager is a professional position hired by elected officials. This sort of local government organization is most popular in medium sized cities, over 100,000 people, and is also popular in smaller more rural communities (ICMA 2017).

Different governments are organized differently, and the manager must interact with each organizational structure differently. Some cities have a city manager directly for responsible almost all city functions, meaning some city managers are responsible for directly supervising fire departments, police departments, and public work departments. Other cities will appoint a director to each department, and the city manager's responsibility is to oversee and direct department heads. In almost all cases, the organization of government will determine that the city manager is accountable to elected officials, themselves responsible to the citizens of the city.

## City Management Responsibilities

A city manager can be responsible for any number of programs, limited only to what can be afforded by the budget and what policies elected officials pass. Often, elected officials at the city level of government are not full-time legislators. Many of them have full-time jobs, and serve their communities part-time to the best of their abilities. This can give the manager a great deal of power, especially, if they are government management experts and elected officials are not. Because the city manager knows more about government than the elected officials, they might usually defer to the expert recommendations of the manager. The

city manager must administer the programs that are asked of them by elected officials, and inform them in their full capacity as an expert about government management, without manipulating them and while remaining subordinate to them. The American Society of Public Administration suggests that ethically, public managers must fully inform and advise elected officials while upholding laws that subordinate them to elected officials (ASPA 2013) – when they do not, and instead make decisions without the consent of elected officials, it is called a principal-agent problem.

One of the most important responsibilities of the professional city manager is to prepare the municipal budget. The budget process is long and ongoing. The manager usually meets with the department heads of municipal agencies long in advance of presenting the city council with the formal budget request. This document is the manager's budget recommendations, which can be modified by the elected officials based on their own priorities. In the United States, many municipal governments are limited to collecting certain kinds of taxes. At most, cities will be able to collect property, income, and sales taxes to fund local government, with property taxes often capped to a maximum amount of revenue. Additionally, most cities are legally limited to have a balanced budget, meaning that expenses cannot exceed revenues – if they do, the budget must either be shrunk or money must be borrowed. Some states even have limits on how much city governments can collect from citizens (Lewis and Hildreth 2013). The manager must account for all of this when preparing the budget request and inform elected officials if their own budget modifications would break any legal rules.

The city manager might be directly responsible for delivering services like public safety, which can include police protection, fire protection, and housing code enforcement. There are a wide variety of public safety functions that a government can fill, and the city manager is responsible for the good functioning of each of them. In recent years, many cities have seen citizen protests against what they see as discriminatory policing. This makes the city manager's job more difficult than ever: They must ensure that public safety services are delivered to city residents, while also ensuring that police remain accountable to all residents of the city. Managers receive input on performance from multiple constituencies, including police unions, department heads, citizens, elected officials, and local groups. The issues that city managers face in ensuring police accountability highlight one of the most difficult parts of governing, how to balance the demands of different constituencies whose interests and desires might directly conflict with one another.

Some city managers may be in highly affluent and professional communities. They might have teams of highly trained and educated experts helping them to make the best decisions. They can have analysts using sophisticated techniques to help determine the best budgetary decision to make, or they might have mapping software experts updating crime maps in real time to help police. On the other hand, some city managers will work in less affluent and relatively economically low-status communities. They might not have a large, trained, and educated talent pool to draw from. They may not have enough financial resources to staff multiple departments. In an affluent city, a highly educated specialist might be the head of the police department – in a less affluent city, a high school educated manager might oversee most of the city departments. Although the discipline has professionalized, city managers can be of all social, educational, and economic backgrounds. The take away from the fact that city managers have so many varying responsibilities, conflicting constituencies, and levels of professionalism and affluence highlights that the professional city manager must be flexible and adaptable. Their responsibilities and resources are determined by their contexts, of which there are a large variety.

## The Future of City Management

The professional city manager has a wide variety of responsibilities that involve the day-to-day administration of local government. They may have to oversee budgeting, public safety, streets, parks and recreation, economic development, and

urban planning, just to name a few. It is likely that they will have to cooperate with federal, state, and nonprofit groups as well, to understand and implement different kinds of policies. With the proliferation of technology in the modern world, the job of city manager has become even more complicated. E-government, or government techniques that rely on the use of information communication technology (ICT), is becoming increasingly important for city managers to understand.

There are three broad ways that ICT, especially the internet, have been used in city management. The first, the service model, aims to use ICT to deliver services to citizens more easily and efficiently. Under the service model, city managers might ensure that citizens can go online to pay taxes, make service requests, or get government data. Most managers and citizens operate under this model of e-government. A manager might use the second model, the consultative model, to get citizen feedback on programs or to solicit ideas for new programs. Under the consultative model, managers can get feedback and ideas directly from citizens using the connective power of technology. This can be especially useful when the manager is facing multiple constituencies with conflicting interests and values, and the possibility of congruence or compromise must be tested. The third model, the participatory model, takes citizen inputs and formalizes it directly into public policy. This third model tends to be more useful for elected officials, who unlike the administrator can pass policy directly (Reddick 2011).

There are benefits to any model of e-government, though it could be argued that more participatory models are better in that they provide the opportunity for the manager to use policy from those who they are ultimately accountable to. E-service delivery alone can increase government efficiency and effectiveness. Another positive democratic outcome of e-government is that it can include more people in government decision making. This is especially true if those people would have a difficult time participating otherwise because of disabilities or because they're worried about being shouted down in public meetings. Still, the manager must take care not to rely too heavily on e-government – there is a digital divide, and not everyone has the access or skills to use e-government. The manager can improve government quality and democracy through e-government, but must take care not to unintentionally exclude some people from accessing government by making it online only (Cropf 2017).

## Conclusion

The responsibilities of city managers have evolved significantly since good government reformers demanded more professional and business-like government. Although no government activity can truly be just like business, professionalizing government helped give cities talented, educated, and quality managers. These sorts of government managers became increasingly important as citizens continue to make demands of government. To meet these demands, government employees became increasingly educated, sophisticated, networked, and trained. Today, city managers handle a wide variety of responsibilities in a wide variety of municipal settings. In almost all cases, they are organizationally accountable to elected officials and should not use their expertise to supersede elected officials. The citizens of the city are ultimately in charge of government, and ethical city managers will respect and enable that whenever possible.

Looking forward into the future, the professional city manager must expect to deal with information communication technology, citizen participation, and e-service delivery. They must implement new processes and technologies into existing government structures. The professional city manager, once believed to be ideally disconnected from politics, more and more uses technology to deliver better services, create more government participation, and open government up to all voices without exclusion. Woodrow Wilson's call for a more professional government was answered, and will continue to be answered, to fruitful effect for citizens – his call for an apolitical government administration cannot be answered. Involved in government as they are, city managers will always be subject to the

concerns, interruption, and questioning of their elected superiors. They must always be accountable to their ultimate superiors, the citizens of the city they manage.

# Professional Development and Training

Becca Janiak
Strategic Leadership Consulting, Port Charlotte, FL, USA

## Synonyms

Change management; Leadership development; Organizational development; Organizational growth; Organizational learning; Organizational training; Strategic leadership

## Definition

Professional development and training is the focused and strategic organizational path toward fostering skills and abilities identified as needed within individuals and the organization as a whole.

## Introduction

Professional development (PD) and training within nonprofits can be a difficult and challenging task. A PD and training program should establish a path for creating a culture that is conducive to positive employee morale and equips employees to work toward achieving the organizational vision. A commitment to professional development and training is indicative of a need for organizational growth, and well-crafted programs can help foster the established vision while also emboldening staff to attain new goals.

However, the amount and type of training offered by nonprofit managers, administrators, and boards are often limited by fiscal constraints and the availability of funding. Ill-conceived professional development programs may intentionally or inadvertently convey the message to employees, and internal or external stakeholders, that leadership is either uncommitted to, or unclear about, the organization's stated agenda, priorities, and goals.

Therefore, when creating a professional development program, it is imperative to design a program that is consistent with the short-term operational needs of the organization and its long-term strategic priorities and organizational culture. Well-designed PD programs have the power to clearly articulate a desired skill or culture and equip staff to meet those expectations. When seeking a strategy for professional development, nonprofit managers must consider how these programs can help meet the needs of the organization as it adjusts to changing fiscal resources and cultural or operational challenges.

## What Is Professional Development?

Professional development is the process of identifying deficiencies, growth areas, knowledge gaps, or professed needs at the level of the

organization, department, position, function, or individual in order to provide the necessary skills to further the mission and purpose of the organization over time. An initial needs assessment investigates the skills and knowledge employees need to perform their jobs or required functions. First, an inventory must be taken to ascertain the gap between the required and actual competencies within the organization. Then, the next step is determine what can be provided to make up for any human resource deficits that have been identified. Nonprofits must be willing and able to think of their long-term growth and needs in order to plan appropriate PD.

## What Is Training?

While training offers many similar attributes to professional development, it differs in its propensity to focus on shorter-term gains in specific skill sets that have been determined by leadership to be necessary or lacking. Training offers staff an opportunity to develop or strengthen a needed skill. By offering this training staff is made aware that they should begin implementing the skills, therefore serving as an indication of strategic direction. Again, like professional development, training requires leadership to develop an idea of what skills are lacking and how to deliver them. Training essentially tackles observed or potential problem areas in a concrete way by retraining and equipping staff with the necessary skill sets. It first creates awareness of either problems or areas of growth and helps change or facilitate desired behavior. It can be done for groups or for individuals, but the key differences are that it concentrates on short-term growth and seeks to impart a specific skill.

As nonprofit employees must often balance simultaneous jobs, duties, and expectations, certain changes can be made to help make training easier to accomplish with frequently smaller staffs and limited time. Tailoring training format and time frame are two accommodations that can be made for nonprofits in order to embrace their unique needs and requirements (Dolan 2002). Training offered in nontraditional classroom settings may be easier to accommodate, as well as training offered for shorter periods of time, such as a half-day or full day. When considering training, nonprofit managers may wish to consider seeking these accommodations. They must also be willing to allocate the necessary time to gain these skills through training and should understand how adding the training benefits the organization's long-term plan.

## Strategic Advantages of Training and Development

Though the task of assessing needs and creating a path of PD and necessary training can be daunting, this process offers many benefits. A message of value is communicated through the inclusion or exclusion of a particular training or PD program. A thoughtfully curated plan can serve as a recruiting tool for well-qualified, dedicated, and competent staff. As organizational leaders set priorities in terms of money and time, they communicate a clear message of what is and is not important within the organizational setting.

Likewise, those areas that do not receive PD or training may be regarded as unimportant and less valuable to employees, resulting in their efforts in those areas being diminished or abandoned. Organizations without directed aims and purposes will end up needlessly wasting money, time, and resources of organizational members. As stated, resource commitments – money and time – communicate priorities to staff, whether intended or not. In light of this, professional development and training are all the more important when considering that they are not only an organizational expenditure but also an explicit endorsement of organizational values. The mere act of considering and developing a comprehensive and skill-driven training plan and future-focused PD path tells staff that learning is a foundational value of the organization, while also communicating that long-term strategy serves a purpose. The plan should be curated with specific short- and long-term needs and desires in mind, placing it within the realm of the strategic plan.

In addition to serving as a recruiting incentive, PD that offers growth and desired skill development can also serve to foster in-house ability and retain competent individuals. Nonprofits operate in a competitive environment in which many organizations are targeting the same funds, time, promotion, and energy. Therefore, it is important to focus on retention and continuously updating competencies. Efforts to gain and maintain human capital will be very difficult if talent is not developed properly. Given the larger globalized economy, employees may choose to trade in their skills to work for another organization, but it is also imperative to provide them with the skills and abilities necessary to help them and therefore the organization succeed in a climate of change. Carefully crafted and implemented PD and training not only helps to create awareness of the needed skills within the organization but also allows staff to feel confident in their abilities to meet these challenges. Assisting staff through skill and ability assessments and updates clearly benefits not only the organization, but serves to reinforce organizational values, while placing value on staff. Having PD and training plans that solve current staff and organizational needs while preparing for future goals is imperative in communicating that value and assisting employees in remaining current.

## Culture of Learning and Growth

Organizations create and cultivate their own unique culture, which either serves or detracts from the organization's mission. Whether culture is intentionally established or one that develops by default as a result of the actions taken by leaders, organizational members, boards, or other stakeholders, it nevertheless shapes the organization and staff. Culture is the product of formal policies, rules, leadership, employee behaviors, and structures combined with informal qualities, such as unspoken or undefined expectations, values, and preferences. These things come together to form an amalgamation of shared meaning and unique organizational culture. Prioritizing training and PD is an opportunity to signal priorities to stakeholders and elevate growth and learning as a valued part of organizational culture. Training helps develop shared meaning around a particular value or skill and establishes them within the organization.

Creating awareness of a skill or ability deficit and then rectifying it by initiating training or facilitating PD are ways to establish a culture that values growth and openly acknowledges weaknesses. By setting aside time and funding for the task of fortifying skills and acquiring knowledge, leadership demonstrates to employees that that is what is valued within the organization. This indicates that those particular skills are what are noticed and prioritized within the culture. Stated or not, this communicates the traits and skills that will help employees engage and get ahead. In this way, a culture of learning is explicitly nurtured by modeling how areas in need of improvement can be targeted and changed. Professional development and training present the opportunity for skill refreshment and organizational learning. Yet, they also create an opportunity to foster an environment of growth through structure and action, rather than through unsupported statements and talk. Knowledge and intellectual capital are requirements for growth and organizational and industry development. PD and training provide a vehicle for creating a climate in which both growth and development are active in a purposeful and meaningful way.

A constraint on nonprofit professional development is limited resources and the difficulty of obtaining operational funding. Yet, nonprofits must not only train their paid workforce but must also dedicate time and effort into recruiting, training, and retaining volunteers. PD aligned with core values supports the long-term direction of the organization and ensures that the vision is being emphasized and communicated to organizational members. By elucidating particular skills, traits, abilities, or ideals during professional development, the organization has an opportunity to convey their importance to employees and volunteers as well as indicate that growth itself is valued. Training also does this in a much more explicit manner. Through training, both staff and volunteers are taught that a particular skill is

needed for the workplace and that it should be implemented immediately, effectively indicating that growth is not only welcomed but a requirement.

Ensuring that staff, leadership, volunteers, and other stakeholders are seeking the same goals and vision can be difficult. This task, of keeping stakeholders aligned to the purpose of the organization, can be reinforced through training and PD that seek to create a collective experience as well as create common examples, language, and other contextual knowledge that can serve as shorthand. Professional development that supports strategic aims can also reinforce organizational alignment. As staff learns skills, abilities, and knowledge set forth in the PD plan, they then share this information which infuses vision, values, and other organizational DNA further into the organization.

Additionally, volunteers see what the employees are attending and learning, sending a message that these skills and abilities are emphasized and prioritized in the organization. As volunteers are included in the training, or even given a brief overview from staff, they too understand the lexicon used within the organization and learn to communicate more efficiently within the organization. Volunteers can also be outsiders and therefore lack a deeper understanding of nuanced phrases, terms, acronyms, and other organizational lingo. Even secondary exposure to training can help alleviate some miscommunication and foster alignment.

## Assessing PD and Training Needs

Though many methods, strategies, and tools can be used to determine PD and training needs, it is important to focus on both long-term goals and short-term deficits. By considering the long-term strategic vision of the organization, nonprofit leadership can discover organizational misalignment. This misalignment can help make clear areas of weakness or opportunities for growth from which PD and training can be developed. It is important to consider tangible aspects of the organization that foster outcomes based upon structures and expectations, as well as intangible areas that contribute to the organization's culture, therefore impacting its effectiveness.

Areas of the organization that can foster more explicit structural changes, such as organizational strategy, hierarchy, and systems, all funnel staff toward implied expectations. For instance, whether an organizational hierarchy is flat or multileveled gives staff particular channels for reaching and communicating with authority. Through an established hierarchy, they understand if they should follow the chain of command or if they can speak directly to the director or manager. Misalignment in these areas may alert leadership that PD or training is necessary to eliminate dysfunction or bring the organization back into equilibrium.

Intangible factors that influence organizational behavior, such as culture and values, existing skill level, and staff habits and attitudes, add to the operational balance of the organization. These areas are often difficult to assess, as they must be uncovered and made explicit through tools such as culture surveys, leadership interviews, or employee feedback. Areas that are found wanting, however, are targeted opportunities to strengthen and correct through a PD and training plan.

## Professional Development and Training Strategies

PD and training should enhance staff skills, deepen the reservoir of organizational knowledge, and expand the culture of learning within the organization. These tasks can be accomplished through a variety of methods. What follows are types of PD and training that can be utilized within a nonprofit organization. They provide only an overview of some different means for developing new skills. Though they are described as unique strategies, they are not mutually exclusive. They can be used in tandem, or on their own, to purposefully and methodically acquire and foster organizational aims. Again, the plan or method chosen for both PD and training speaks specifically to the organizational approach for its intended growth trajectory.

***Coaching and Mentoring*** Coaching and mentoring involve a one-on-one process that helps assist individuals in gaining particular skill sets and capabilities in a highly personalized way. It is designed to help a particular person acquire a particular skill. Coaching and mentoring can occur in a vertical relationship (mentoring) or a parallel relationship (coaching), allowing any member of the organization to participate. Coaching is often more about encouraging and supporting another's efforts to improve something they have sought out guidance for through active listening, reframing, and other guiding methods. Mentoring can involve a predetermined skill or ability and utilizes more direct assistance in imparting that particular focus. Both have the benefit of being highly interactive and cost-effective, which can beneficial for nonprofits. As mentoring can involve requesting that staff acquire predetermined skills or abilities, it can fall into the category of training. Managers may wish to strengthen areas of deficit and may ask for one or more employees to be mentored, therefore increasing their competency. Coaching may fall more into the realm of PD, as it is a strategic decision to bolster abilities in order to increase career potential, making it a longer-term focus.

***Career Planning*** Career planning offers staff a chance to select and work toward their long-term goals. It is individualized as well, but is also aligned to meet organizational needs. Employees determine their values, interests, capabilities, and other self-aware factors in order to determine where they would like to progress by the end of their career. With this in mind, nonprofits can develop programs, workshops, and other interventions to help employees accomplish these goals, yet they are employee-requested initiatives. Career planning has the organizational advantage of helping reduce turnover and increase staff satisfaction, but also presents individual employees with a focused plan they can use to assertively improve their own career. It therefore enhances skills and deficits that individuals have stated they need, but it also delivers stronger skill sets that offset organizational weaknesses, creating both individual and organization-wide interventions. Examples of career planning include job preview, assessment centers, job rotations, consulting assignments, and training interventions. Though the staff facilitated aspect of career planning may intrigue some, others may choose not to participate. Those that choose to participate can create their own PD path to their career goals, while others may choose only to attend particular trainings.

***Management and Leadership Development*** What differentiates career planning from management and leadership development is that the former is driven by the employee, while the latter by the organization. In management and leadership development, the organization determines what skills and knowledge it believes are necessary to advance strategically in the future. The organization then chooses to cultivate these assets in its employees. Unlike career planning, staff are told what values and attributes are considered more important to be promoted within the organization. Organizationally driven interventions can help prepare employees for future success, but could also lead some staff to conclude they are powerless to direct their own development. In a sense management and leadership development is both training and PD. It is training as the organization determines what skills are integral to its future success and who should acquire those skills. It is PD because it is clearly focused on the long-term health of the organization and is a strategic and purposeful plan. For nonprofits in areas of extensive turn over, implementing management and leadership development can be vital for long-term strategy.

***Communities of Practice and Professional Learning Communities*** Communities of practice are those that seek to collaboratively accomplish goals that could not be done independently. The objective is to create an environment of intellectual exchange so that the outcome of the work will be greater than the individuals. These informal communities are formed around similar interests with expertise focused on practical ideas and solutions (Wegner et al. 2002). Within the world of nonprofits, these communities often occur in formal or informal professional associations

formed to serve the sector an organization is part of or a professional field targeting areas of leadership. Some examples of informal professional communities may include executive directors of local nonprofits gathering for informal lunches to discuss community challenges or founders of international aid organizations participating in online chats to present their challenges and contribute their own insight for others. Though they are informal, they still add value to the organization's knowledge base. Such communities have been shown to enhance PD, learning, and knowledge within an organization. Similar groups exist in the form of professional learning communities (PLCs). PLCs are groups that form around an idea, concept, book, or topic to allow peers an opportunity to delve deeper into their chosen discussion. Through the unique perspective of the group members, they are exposed to different methods for growth and development. The objective is to foster organizational changes through the PLC. The intent is that members apply what they have learned. Other staff members observe and discuss those changes and can choose to apply them as well. This leads to a larger impact than just the initial members. PLCs and communities of practice both require time to fully develop, but allow members an outlet for their learning. Just as with management and leadership development, communities of practice and PLCs can function as both training and PD. In some workplaces staff are forced to join PLCs with the intention that it will serve as PD, but without a purposefully long-term plan, it is merely a brief training in whatever book or topic is being discussed.

## Conclusion

Professional development and training in nonprofits can help organizations cultivate skills and abilities that will give them a strategic advantage and as they prepare for future growth. As the organizational knowledge increases and a culture of learning is fostered, organizations place themselves in a stronger position to recruit, receive funding, and retain top talent. Yet, skills enhancement in the form of training and PD is not only beneficial for the organization but also places employees in a position to attain promotions and control their own career in a purposeful way. Although it requires dedicated resources in terms of time, effort, and money, professional development and training can place both the individual and the organization in an advantageous, strategic position for the future.

# Professional Ethics

David A. Bell
Savannah State University, Savannah, GA, USA

## Synonyms

Ethical behavior; Ethical decision making; Moral awareness; Moral judgment; Moral reasoning

## Definition

Professional ethics in public administration involves behavior that is based on beliefs. The

values and principles expressed in behavior constitute professional ethics, while beliefs about "life, humanity, and nature" are the morals informing the behavior (Menzel 2017, p. 24). Professional ethics is about the professional as a moral agent; however, understanding ethical behavior requires a broader examination to include external influences. Public administration is about serving the public, and professional ethics is about doing so with integrity.

## Introduction

Professional ethics is about the behavior and decision-making of public servants. An essential prerequisite for effective public service is public trust. This trust is influenced in large measure by the people's perception of public servants. Moreover, understanding and possessing ethical competence are vital to effectively navigate the complexity of administering public service (Menzel 2017; Plant 2015). The challenge is found in developing the principles and standards, as well as their expression and diffusion throughout the profession. The empirical record demonstrates that developing and diffusing are as dynamic and evolving as are the principles and standards of the society and political institutions that form the context where public services are provided.

Professional public administrators are called upon to serve in a manner that expresses values such as effectiveness, efficiency, and social equity. Citizens and their elected officials require quality service. Effectiveness is about performance in serving the public and efficiency involves doing so with value. Getting the job done in a quality manner, while providing a high benefit-cost return, is part of the twenty-first-century mantra of public service. In addition, providing public service that is responsive to different constituencies is central to democratic values. It is the pillar of social equity that drives consideration of "Efficient for whom? Economical for whom?" (Frederickson 1990, p. 228). Moreover, an extensive body of research drawing upon a variety of public servants has demonstrated a connection between ethics and performance. For example, a positive relationship has been found between *ethical management practices and behavior* and *improved performance*. Behavior that expresses effectiveness, efficiency, and social equity is embedded in ethical decision-making.

Ethical behavior is the result of public servants' decisions about right and wrong. The capacity to make such decisions is moral agency. It is important to possess the ethical competence necessary to identify and act on ethical situations. Developing ethical competence is a journey more than a destination. It involves understanding and employing tools to behave in a professionally ethical manner. It is also necessary to understand the important effect of the organizational context, on behavior including professional relationships. Decision-making tools that aid both examining ethical problems and developing courses of action can greatly assist professional public servants to demonstrate ethical competence in behavior. Moreover, understanding the influence of role models, employing steps such as self-reflection, and ascertaining the empowering-suppressing influences of the organization context provide important insight into decisions about right and wrong that are expressed in behavior.

## Professional Ethics and Public Trust

In 1887 Woodrow Wilson revealed a connection between the professional ethics of public servants and public trust. He described professional public service as possessing a "moral atmosphere" and the "sanctity of public office as a public trust" (Wilson 1887, p. 210). In the late twentieth century, a national public-private partnership emphasized the importance of public servants understanding their work as public trust with two overriding responsibilities. First, serving the public interest was the focus, above self and the organization. Second, their service was to be executed with integrity (Menzel 2017). In recent years, public trust in senior government administrators has been alarmingly low. Some believe one of the main reasons is that administrators have lost their ethical and moral compass. Consider the too

frequently used defense by senior administrators who find themselves embroiled in a public scandal: *no unethical or immoral act was committed and no law violated*. It is the implied aim of satisfying a minimum standard that is alarming. The connection between professional ethics and public trust has been demonstrated throughout the decades, which was integral to the development of codes to inform ethical behavior of professionals.

Generally, a key driver to developing codes of ethics has been threats to public trust posed by scandal or public disclosure of unethical behavior. Beginning in the late nineteenth century, local and national public service reform efforts aimed to address intertwined issues involving social, political, and economic concerns. By mid-twentieth century, the focus had narrowed to executive government issues. The City Managers' Association was formed in 1914 and in 1924 developed the first code of ethics for local government professionals. Now called the International City/County Management Association (ICMA), an important issue of the time was public administrators recognizing elected officials' primacy in developing public policy. For example, a 1938 revision to the code explicitly expresses that the manager was not a political leader. Today the ICMA code (http://icma.org/m/en/icma/ethics/code_of_ethics) is generally viewed as a combination of ideals and practical prudence.

Another code ascribed to by many public servants and researchers is generally viewed as emphasizing ideals of honor and integrity in public service. This code, developed by the American Society for Public Administration (ASPA), was stoked by the Watergate scandal and growing concerns for social equity in providing public service (https://www.aspanet.org/ASPA/About-ASPA/About-ASPA/apex; then go to "Ethics and Integrity"). In 1974 ASPA formed the Professional Standards and Ethics Committee. Among the important outputs of this committee was the 1984 code of ethics, "To safeguard the public trust, 'unacceptable' practices such as subordinat [ing] public positions to private gains' should be opposed, and the qualities of justice, courage, honor, equity, competence and compassion' should be actively promoted" (Svara 2015, p. 262).

## Ethics Management: Formal and Informal

Codes of ethics are part of the broader work of ethics management (EM). EM is work at the organizational level to ensure behavior that properly stewards the public trust and performs at a high level. It is the organization working to be a place of integrity, "where individuals treat each other with respect, take pride in their work, care about one another, promote accountability, and place constituents and public interest over individual and organizational self-interest (Menzel 2017, p. 16). In other words, professional ethics are about the behavior of public administration professionals, and ethics management is the organization's work aimed to facilitate exemplar behavior.

There are various frameworks to inform the practice of ethics management. Some particularly useful ones are found in Dr. Donald Menzel's (2017) work. Here, the work of Berman, West, and Cava (as reported in Menzel 2017) provides a useful approach to thinking about EM. This study of municipal human resources officers confirms, and is confirmed by, other studies providing key insights of EM. The study provides insights on activities that can be categorized as *formal* and *informal* (Fig. 1).

Both formal and informal strategies have demonstrated effectiveness. Laws, such as The Honest Leadership and Open Government Act of 2007, are understood as foundational components of formal strategies employed by organizations. Many practitioners have reported valuing codes and expressed the belief they contributed to positive ethical behavior. Some have expressed the belief codes that are the best way to prevent corruption. Berman et al. found that an informal strategy – moral leadership – was more effective than codes in accomplishing organizational ethic objectives (Menzel 2017, p. 33). In practice, both are used. For example, leaders displaying codes are deemed to be taking an important step in inculcating an ethical culture. When looking at several aspects believed to impact ethical culture, individually and various combinations, the one with the greatest impact was senior and local managers' commitment. This speaks to code

**Professional Ethics, Fig. 1** Ethics management framework. (Adopted from Menzel (2017, pp. 32–33))

| Formal Strategies | Informal Strategies |
|---|---|
| Mandatory training | Leadership |
| Ethics as a criteria for rewards | Providing positive role models |
| Adoption of rules promote an ethical context (e.g., code of ethics) | Positive reinforcement |
| Ethics as a criterion in hiring and promotion | |
| Adopted from Berman, West, and Cava 1994 as referenced in Menzel 2017 (p. 32, 33) | |

being embedded in the organization culture. Research demonstrates that ethics management plays a central role in fostering ethical behavior.

Professional ethics is about the behavior of public service professionals, primarily in the context of the public organization where ethical management can shape decisions about right and wrong. The aim is to develop ethical competence in public servants with the expectation that resulting skills, knowledge, and abilities (competencies) are reflected in providing public service. Better decision-making about right and wrong behavior results in public trust and quality performance.

## Ethical Competence and Decision-Making

Menzel provides a variety of views and definitions for ethical competence, concluding that the shared components are "moral reasoning, public service values, and a knowledge-action link" (Menzel 2017, p. 53). It seems, in general, that most public administrators continuously examine options using competencies included in this framework to satisfy their supervisors, employees, and the public. Developing the competencies that result in an ethically competent professional is served by many strategies and tools.

An important competency that is integral to moral reasoning is moral awareness. That is, in order to reason about moral aspects of a problem, the professional must first recognize that the situation has moral content. This is important because "identifying an issue as ethically significant presumably helps to initiate ethical decision making and in turn makes ethical behavior more likely" (Trevino et al. 2006, p. 953). Several factors can serve developing moral awareness. When the focus is on professional ethics, developing moral sensitivity seems to be particularly useful. Moral sensitivity can be understood as the "ability to recognize that a decision-making situation has ethical content" (Trevino et al. 2006, p. 953). Research has demonstrated that this sensitivity can be developed via training and experience (Menzel 2017, p. 55; Trevino et al. 2006, p. 953; Velasquez et al. 2009). For example, training is widely offered on public service values (e.g., codes, standards, laws/regulations) and how to recognize ethical issues. The ability to recognize and identify moral conflicts and situations is foundational to being ethically competent.

A key challenge is found in the knowledge-action link. When ethical competence involves not only avoiding unethical behavior but also advocating for principled actions and behaviors, understanding the challenge is underscored. For instance, professional ethics involves integrity expressed in honesty and truthfulness, as well as an uncompromising commitment to these regardless to personal "advancement, honor, or gain" (Menzel 2017, p. 99). This includes taking responsibility for personal actions, behavior in accordance to codes and laws, and encouraging ethical behavior in the organization through personal example and initiatives. The challenge is found in that there seems to be a disconnection between moral reasoning and moral behavior. Self-reports indicate a high degree of automaticity and an absence of moral reasoning or internal mental struggle in deciding the course of action. Sometimes moral desires are so connected to core identity that moral action is spontaneous (Trevino et al. 2006, p. 960). That research underscores the importance of context, such as organizational

culture, on moral behavior (Menzel 2017, pp. 25, 131, 145, 146, 174, 175; Trevino et al. 2006, pp. 956–957) and places an emphasis on preparing and equipping public service professionals to act when the context is unfavorable.

A practical first step in developing ethical competence and an ethical decision-making framework can go a long way to addressing the challenge to the knowledge-action link. Self-reflection is an important starting point to becoming an ethically competent public service professional. Menzel (2017) outlines steps to employing an audit (pp. 56–57). These include steps to address personal subjectivity, such as by having others involved for a broader perspective. Kevin Kearns (2016), in his work with the Leadership Portfolio Program for graduate students at the Graduate School for Public and International Affairs, University of Pittsburgh, explains the program's core value of *self-awareness* by using these points:

- Effective leaders are aware of their inclinations, predispositions, "style," and strengths and weaknesses.
- Committed to continuous process of self-reflection and discovery.
- Surround themselves with staffs who challenge as well as support.
- Comfortable with subordinates who contribute to this learning process.
- Blend of confidence and humility.
- Committed to diversity of all types in the workplace and in the executive team.
- Often seek the counsel of a mentor, coach, or trusted colleague.

Understanding *self* with respect to the values and beliefs of the profession, organization, and the public is important to understand the knowledge-action link. The behavior and moral reasoning of ethical competence are closely linked to a sense of self and identity (Trevino et al. 2006). In organization settings where the situation defines ways of behaving as part of the culture, ethical competence may require navigating knowledge-action disconnection (Menzel 2017, p. 25). In addition to an awareness of their ethicality, public service professionals can employ a decision-making framework to situations that aids ascertaining ethical components and possible responses.

Manuel Velasquez and his colleagues (2009) developed a useful framework for thinking ethically about dilemmas and courses of action. The key steps are:

1. Recognize an ethical issue. Is there damage to others? Is the choice between two bad options or two good options?
2. Get the facts. Who are the key stakeholders and have they been consulted? Are some interests more important? Why?
3. Evaluate alternative actions. Which provides most good with least harm? Which best respects the rights of all stakeholders? Which best services the community as a whole?
4. Make a decision and test it. What would a respected friend or a television audience say about the choice?
5. Act and reflect on the outcome. This requires courage and self-control (Menzel 2017, p. 101).

Professional ethics requires the public servant to understand their ethicality and their moral agency capacity and employ tools and techniques to navigate perils such as the risk of job loss and being ostracized.

## Conclusion

Professional ethics involves public servant behavior and decision-making. Public trust is foundational to effective public service. Understanding and possessing ethical competence are essential to effectively navigate the complexity of administering public service. It requires moral agency, ethical competency, and integrity.

Behavior that expresses effectiveness, efficiency, and social equity is embedded in ethical decision-making. Effectiveness is about performance in serving the public, and efficiency involves doing so with value. In addition, providing public service that is responsive to different constituencies is central to democratic values. It is the pillar of social equity that drives consideration of "Efficient for whom? Economical for whom?"

Ethical behavior is the result of public servants' decisions about right and wrong. This requires moral agency. Developing ethical competence is a journey more than a destination. It is also necessary to understand the important effect of the organizational context, including professional relationships, on behavior. The organization can be empowering or suppressing. Moreover, understanding the influence of role models, employing steps such as self-reflection, and ascertaining the empowering-suppressing influences of the organizational context provide important insight into decisions about right and wrong that are expressed in behavior.

# Professional Norms in Public Sector HRM

Siegrun Fox Freyss
Department of Political Science, California State University, Los Angeles, CA, USA

## Synonyms

Human resource management (HRM); Organizational culture; Professional work; Public personnel policies; Public workforce management; Standards of self-regulated work behavior; Technical expertise

## Definition

Norms: Standards, best practices, guideposts, foundational values, expectations, and principles
Professional: Standards developed in a field of study, acquired through training and education, and applied systematically in employment practices and work settings.
Public personnel: Government employees and public workforce.
Public personnel administration: Public sector human resource management (HRM) and human capital management.

## Introduction

Merit system and civil service, along with equal employment opportunity, bring fundamental, professional norms to human resource management (HRM) in the public sector. In turn, the personnel standards form the core of public administration principles and practices in general. The core standards are supposed to ensure quality services, competence, and efficiency, as well as stability and predictability. Such administrative traits can be valuable to provide continuity of services even if the political arena is unstable during election campaigns and in crisis situations.

## Clarification of Terminology

Changes in the terminology, used to describe the administration of the public workforce, reflect efforts to innovate in the employment arena. The original term was "public personnel administration," which is still widely used. Following the lead of the business sector, the public sector switched to "human resource management" (HRM) some years ago. The switch was to reflect shifts toward a more activist role for human resource professionals. As part of a team, they were expected to help their government employer achieve its mission. Employees were supposed to be actively managed so that they could contribute their best efforts toward the achievement of organizational goals. More recently, the term "human capital management" has been introduced to emphasize the strategic importance of the workforce in accomplishing the government's mission. Most practitioners and academics use the three terms interchangeably, and so will this article.

The term "profession" or "professional" also deserves some explanation. It is widely used in HRM and refers to the standards that have evolved over many years and are considered best practices or successful practices. Court decisions, professional organizations, master of public administration programs, and progressive governments all contribute to our understanding of norms in the human resource field.

Table 1 shows the historical evolution of the term "civil service." Originally, the term is distinguished between the civilian service and military service. Then the term was limited to government employees who underwent rigorous selection procedures, had to remain nonpartisan with respect to election campaigns and political candidates, and in turn enjoyed job security. In contrast, exempt employees were appointed because of their political ideology and loyalty to elected officials, and the length of their service depended on the electoral fate of their superiors.

**Professional Norms in Public Sector HRM, Table 1** Breakdown of civil service terminology

| Civilian service | | Military service |
|---|---|---|
| / | \ | |
| | **Civil service** | Has its own ranks |
| Exempt (from civil service rules, political appointees, at-will employees) | Not exempt (from civil service rules), regulated by merit system principles (described below) | |

## History

The first major set of professional standards became the merit system or civil service, and an important year was 1883. In that year, Congress passed the Civil Service Act, also called the Pendleton Act. The Act codified four principles:

- Meritorious hiring
- Political neutrality
- Job security
- Creating a neutral or bipartisan civil service commission to issue civil service rules and administer public personnel policies

Some states and local governments quickly followed suit, Albany in 1884, Buffalo in 1885, New York City in 1888, Seattle in 1896, and Los Angeles in 1903. It was a victory for the Progressive Movement and reformers who sought the change to weaken the corrupt power of the patronage system or spoils system (Van Riper 1958).

Congress and the Roosevelt Administration accelerated the adoption of merit systems across the country, when states and local governments received the mandate to implement the programs of the Social Security Act of 1935. To ensure efficiency and professionalism in the implementation, Congress included in the Social Security Amendments Act of 1939 the requirement that states and local agencies adopt merit system standards for personnel that administered the federal programs (Fox 1993, p. 9).

## Meritorious Hiring

The principle of meritorious hiring has evolved over the years into comprehensive selection

procedures. Depending on the job to be filled, applicants are tested on their knowledge, skills, and abilities (KSAs), as well as competencies in verbal and written communication. Educational achievements and previous job experiences have become additional core rubrics. The civil rights movement and the women's movement in the 1960s laid bare biases in selection procedures, and court rulings have established the norm that selection criteria be job related and not related to the applicants' demographic characteristics, such as race, ethnicity, or gender. The first important case was *Griggs v. Duke Power* (1971).

Job relatedness can be determined by job analysis, which is supposed to identify the content of a class of jobs and the qualifications required to fulfil the job successfully.

## Political Neutrality, the Hatch Act, and Job Security

The principle of political neutrality required civil service employees to remain uncommitted with respect to elected officials and political candidates. The policy weakened political machines in that they could not officially draw on government employees to help with election campaigns. The principle also protected public employees from pressure to support political candidates; and it created relatively peaceful worksites, where differences in political opinions did not paralyze the work flow.

Congress passed the Hatch Act in 1939 to reinforce the principle of political neutrality. It denied federal employees the opportunity to show support for Franklin D. Roosevelt, a popular president, who had given them jobs with the New Deal programs. The Hatch Act had consequences for state and local governments as well in that Congress passed an amendment to the Hatch Act in 1941 which applied the principle of political neutrality to state and local agencies that received federal funding and administered federal programs. In addition to the federal pressure, states and local jurisdictions adopted the principle of political neutrality by passing laws that came to be known as "Little Hatch Acts."

The edict of political neutrality limited the public employees' freedom of speech. However, in return for giving up a first-amendment right, civil servants would enjoy job security. This provision also benefited the public. Continuity of government services could be ensured despite turmoil in the political ranks during election campaigns.

## The Civil Service Commission

To manage the new personnel policies, introduced with the Civil Service Act in 1883, Congress created a semi-independent agency, the Civil Service Commission. It was headed by three bipartisan members appointed by the President for limited terms. The Commission received the comprehensive authority to fulfil the functions of legislators, administrators, and judges in federal personnel matters. States and local governments also appointed neutral commissions to manage personnel functions.

However, at all three levels of government, patronage was entrenched and the merit system took hold only slowly. A survey by the International City/County Management Association (ICMA) in 1989 found that 64.1% of cities and 56.3% of counties had a formal merit system in place. Cities in the 100,000–249,999 population range and counties with a population of 250,000 and above were most likely to have adopted 1%, 91.4%, and 78.3%, respectively. Differences by region could also be observed, with the cities in the West having the highest adoption rate (80.8%) and in the Northeast the lowest (44.6%). The equivalent numbers for counties were 71.4% and 36.4% (Fox 1993, p. 11).

## Searching for Efficiency Through Standardization

As the population and the number of public employees grew, efficiency through standardization emerged as an important principle. At the federal level, a milestone was reached with the Classification Act of 1923. It established a

position management system for the federal government. Similar legislation was passed by states and local governments. The classification systems hold job descriptions, grouped by classes, required KSAs, minimum education level, work experience, and various other pieces of information. The classes of positions have expanded so much that simplification through contraction and even broad banding has been proposed (National Academy of Public Administration 1991, p. 45; Berman et al. 2016, p. 181).

## Searching for Efficiency by Abolishing Job Security

In the 1980s, the debate over merit systems shifted from strong support to some opposition. Conservative critics argued that job security protected poor performance and was demoralizing the public workforce. Meritorious standards could be restored by abolishing the merit system. A few states with conservative majorities and weak public sector unions proceeded dismantling the civil service for most of their state employees – Texas in the 1980s and Georgia in the 1980s – and other states are tweaking some of the traditional standards.

Opponents of the reforms argue that the lack of job security returns the organizational culture of public agencies back to the patronage or spoils system. International observers from developing countries also fear that the criticism and push toward termination will have negative consequences for their countries where corruption is rampant. They want their countries to adopt the merit system, seek compliance with the professional norms, and grow a proud culture of public service – and they look to the United States for guidance.

Table 2 is an attempt to bring some order to the various arguments. The table takes into consideration the observation that a written merit system policy is no guarantee against corruption, as a dozen cases in Southern California have shown in recent years. In contrast, other jurisdictions are managed professionally even though no formal merit system has been adopted. The argumentation also suggests that the promotion of a meritorious culture will be more effective in the long run than a rigid enforcement of rules.

**Professional Norms in Public Sector HRM, Table 2** Merit system policy options

| Degree of corruption | Merit system in place | |
|---|---|---|
| | Yes | No |
| **Low** | Examine possible deficiencies, e.g., rigid rules, that justify simplifying merit system standards | Perhaps adoption of a formal merit system policy not necessary |
| **High** | Enforce the law and work toward a proud culture of public service | Adopt a merit system policy, enforce it, and work toward a proud culture of public service |

## The Civil Service Reform Act

The federal government responded to the pressure to innovate by passing the Civil Service Reform Act in 1978. It was a major revision of the original Civil Service Act passed nearly 100 years earlier. The new Act introduced pay for performance, merit pay for middle managers, and bonuses for the senior executive service. Research suggests that the policy has not been well received.

Another change involved the reorganization of the personnel functions. The independent civil service commission was abolished and replaced by three new agencies:

- The Office of Personnel Management (OPM)
- The Merit System Protection Board (MSPB)
- The Office of Special Counsel (OSC)

OPM, an independent federal agency, took on the responsibility of managing the federal workforce and administering the functions of a typical personnel department. To limit corruption, MSPB was created as an independent regulatory agency that would, as the name implies, protect merit

system standards in federal personnel decisions. Another new agency, the Office of Special Counsel, was charged with protecting whistle-blowers and defending them against retaliation. Again, state and local governments enacted similar legislation (California Public Employee Relations 2016, pp. 94–101).

## The Federal Government as Model Employer

Since passage of the Civil Service Act in 1883, the federal government has achieved a good reputation as a model employer. It also is a model employer with respect to the contents of the website maintained by the Office of Personnel Management (OPM), not only with respect to the display of personnel information but also with respect to the posting of best practices in human resource management. Since the federal workforce is spread all over the world and since supervisors, no matter their location, need to have ready access to professional advice, the OPM website addresses many issues that supervisors, as well as rank-and-file employees, might encounter in the course of their work.

The Merit System Protection Board (2011) identified nine merit system principles, which are presented here in full because they provide an excellent summary of professional norms and best practices as developed over the last 100 years:

1. Recruitment should be from qualified individuals from appropriate sources in an endeavor to achieve a workforce from all segments of society, and selection and advancement should be determined solely on the basis of relative ability, knowledge, and skills, after fair and open competition which assures that all receive equal opportunity.
2. All employees and applicants for employment should receive fair and equitable treatment in all aspects of personnel management without regard to political affiliation, race, color, religion, national origin, sex, marital status, age, or handicapping condition and with proper regard for their privacy and constitutional rights.
3. Equal pay should be provided for work of equal value, with appropriate consideration of both national and local rates paid by employers in the private sector, and appropriate incentives and recognition should be provided for excellence in performance.
4. All employees should maintain high standards of integrity, conduct, and concern for the public interest.
5. The federal workforce should be used efficiently and effectively.
6. Employees should be retained on the basis of adequacy of their performance, inadequate performance should be corrected, and employees should be separated who cannot or will not improve their performance to meet required standards.
7. Employees should be provided effective education and training in cases in which such education and training would result in better organizational and individual performance.
8. Employees should be:
   (a) Protected against arbitrary action, personal favoritism, or coercion for partisan political purposes
   (b) Prohibited from using their official authority or influence for the purpose of interfering with or affecting the result of an election or a nomination for election
9. Employees should be protected against reprisal for the lawful disclosure of information which the employees reasonably believe evidences:
   (a) A violation of any law, rule, or regulation
   (b) Mismanagement, a gross waste of funds, an absence of authority, or a substantial and specific danger to public health or safety

To disseminate the meaning of the principles and promote compliance, MSPB declared each month in 2011 “a merit system principle of the month.” This educational strategy gave MSPB the opportunity to post long lists of questions and answers on its website, as well as case studies.

## Equal Employment Opportunity and Affirmative Action

Apart from civil service reform, new professional norms for personnel management were introduced with Title VII of the Civil Rights Act passed in 1964, plus amendments. It established the principle of equal employment opportunity (EEO). The Act prohibits discrimination in employment on account of race, color, religion, sex, and national origin. Later amendments dealt with disability, age, pregnancy, and in some states sexual orientation. The Equal Employment Opportunity Commission (EEOC) was established to enforce the law.

EEO is intractably intertwined with affirmative action. Some argue that affirmative action plans are needed to make up for past discrimination, while others maintain that such plans violate EEO and lead to reverse discrimination for white males. Courts have tried to find a balance between the conflicting interpretations, and over the years, the US Supreme Court has ruled on many cases.

## Debating Professional Norms in the Information Age

The nature of professional norms, standards, and best practices in public sector HRM is constantly evolving, and the internet can be used to share information across time and space. Contributors can be federal employers, as well as states and local governments that continuously seek improvements in principles and practices. Court decisions have provided guidelines. Scholarly research and professional organizations also make valuable contributions. The International Public Management Association-Human Resources (IPMA-HR) is a clearing house and provides a public forum for innovative developments. The International City/County Management Association (ICMA) and the American Society for Public Administration (ASPA), especially its Section on Personnel Administration and Labor Relations (SPALR), are valuable participants in the discourse on public sector HRM as well.

## Conclusion

Professional norms touch employers and employees, managers, supervisors, and workers on a daily basis. The norms can be the written rules that new employees receive as part of their orientation on the first day of work and that are perhaps reinforced and updated annually. Professional norms are also the principles and practices that students acquire as part of their professional training in public sector HRM. New trends can be shared at professional conferences and in Webinars. In general, the norms add to predictability and stability in public administration, as well as to the quality of service. HRM is at the center of any bureaucracy, and stable, high quality government service is central to the well-being of the country.

# Professionalism and Professionalization in Russia

Roman Abramov and Elena Iarskaia-Smirnova
Department of Sociology, National Research University 'Higher School of Economics', Moscow, Russia

## Synonyms

Critical ecology; New-weberian approach; Occupations; Post-socialist Russia; Pre-socialist Russia; Professional autonomy; Professional groups; Professions; Russian intelligentsia; Socialism; Sociology of professions; State control; Work ethics

## Definition

**Professionalization** may be considered in several dimensions. First, as a positive and progressive force that fosters social change in ways that minimize social conflict and disintegration. Second, as a complex historic process, a connected sequence of events, as a result of which an occupation acquires a certain set of attributes. Third, as a professional socialization in workplaces, relationships in the everyday life of occupations, and their meanings in working routine and in wider contexts. Fourth, as the project whereby a distinct occupational group seeks to gain a monopoly control of competence and credibility with the public and, as a result, to secure an increase in income, power, and prestige. Fifth, as wide changes in the occupational structure, when the number of "professionals" or "white-collar workers" increases in comparison with representatives of other types of occupations.

**Professionalism** can be viewed in several dimensions. First, on the individual level, professionalism is a characteristic of a competent specialist, possessing special attributes, for example, credentials, specialized knowledge, practical experience, work ethics, and group identity. The basis of professionalism is thus considered to be technical knowledge and the ideal of service. At the level of the professional community, professionalism may be understood as a result of a series of predictable stages of occupational change during the process of professionalization. The term professionalism refers also to a special state of occupation, characterized by the presence of a developed professional culture, a specialized training system, a monopoly on the provision of services in a certain sphere, a significant role for the professional community, and so on. Different models of professionalism have historically developed in different countries, related to the role of the state, the economic structure, social structure, and political situation. In these historically developed models, professionalism is differently defined, and the basic criteria of its definition are refracted in different ways.

## Introduction

Within a sociological context, professionalism is increasingly examined on the macro level as a universal social phenomenon that is evolving in diverse ways throughout modern societies. Approaching professionalism from a phenomenological perspective entails investigating it at the micro level; such as examining group communication in the labor process, during which meanings are produced that are shared by members of a professional group. The professionalism and professionalization in Russia are presented in this entry within the theoretical framework known as the "critical ecology of the professions"; a research direction that seeks to reconcile the macro and micro levels of professionalism and combine wider views of certain institutional universals with knowledge of local cultural contexts and the specific contexts of various occupational groups. This approach combines the theoretical lens of critical ecology with a neo-Weberian stance that understands professionalism as emerging from a system of arguments that support the upward mobility of members of a particular occupation. The professionalization here is treated as a fluid and multifaceted phenomenon. The authors show how the processes behind it have evolved

across the shifting contexts of prerevolutionary, Soviet, and post-Soviet Russia.

## Theoretical Frameworks

It was in the 1970s and 1980s that professionalization began to be understood, in accordance with the neo-Weberian approach, as a process whereby increasing social status was achieved through various types of social closure (Abbott 1988; Larson 1977). Thus, social closure is a vital building block in the formation of professionalization, which serves the function of legitimizing the claims of a certain professional group to a monopoly on the provision of a specific service (Evetts 2003). Professions do not, however, develop in isolation from one another, and it is important that professionalization be examined with reference to changes in the national and global context. It is in this context that the utilization of an ecological approach is of particular benefit.

An ecological approach to the sociology of occupations and professions first appeared in the works of Hughes (1971). Here the term "ecology" was employed to refer to the contexts and environments in which professionals operate. The term also includes the conditions within a profession that create opportunities for or build barriers against various types of professional practice. Abbott preferred the term "ecology" when he talked about the professions as he argued professional groups appeared as systems of actors and tasks tied together in interlinking relationships, which Abbott called "linked ecologies" (Abbott 2005).

The "critical ecology of the professions" shares the common research question of how professionalism emerges and professional groups are formed in a variety of geographical, physical, and cultural contexts. What is important here is how professionalism is understood among the actual practitioners of the profession, how the members of a profession perceive the groups and institutions that surround them, as well as what universal traits of professional practice are seen to dominate in each context. Dalli and her colleagues vigorously advanced the concept of a "critical ecology of the professions" by applying a critical perspective to the study of the political and social realities, challenges, and ordeals within professional practice at the various levels of professional systems (Dalli et al. 2012). Professionalism, thus, is not seen as a phenomenon created by a singular event or action, but, rather, as a process (Dalli 2010). Within this approach there is a preference to view professionalism as a social phenomenon, which is influenced by changes at the macro level (e.g., public policy and priorities) and changes in the micro level (the work environment, the everyday and culture in the workplace). Thus, at both the macro and micro level, there are differing agendas of requests and expectations as to what constitutes "professionalism" (Karila 2008).

This approach finds its origins in the work of Bronfenbrenner, who singled out several levels of ecosystem (micro-, meso-, exo-, and macro-) that could be applied to the context of studying professional practice. Bronfenbrenner proposed to use these levels as a set of structures organized on the principle of the Russian *matryoshka* doll. He also designated another level, the chronosystem, to describe historical changes in the ecosystem (Bronfenbrenner 1986). The key definitions and the legal framework supporting the functioning of a given profession, as well as the status standards of professional activity, are thus seen to change under the influence of both internal and external factors (Krause 1991). In this entry, the focus of analysis will mainly be at the level of the so-called chronosystem.

## Professions and Professionalization in the Pre-Socialist Period

The macro environment of the early Russian professions was formed under the direct influence and control of the state authorities. Vocational training of technical experts was introduced in Russia by Peter the Great at the beginning of the eighteenth century in, mining, the military, medicine, and public administration. Engineering and the medical profession both developed with particular intensity due to the close links that were forged with the army. Peter overhauled the previous system of class and estates and created a new one, the Table of Ranks, which was based on the

principles of state service. It was this system that would operate for almost the entire remaining history of the Russian Empire formed the structure of the Russian society.

The opening of new universities and administrative reforms at the beginning of the nineteenth century created a new institutional framework that could support the growth of professional bodies in Russia. Prior to this the "ecology" of the professions had been largely the domain of the state bureaucracy (Shepelev 1999). The liberal reforms of Alexander II (1864–1870), in particular the abolition of serfdom, improved levels of geographical, social, and intellectual mobility among different population groups (Balzer 1996, p. 56) and brought about significant change to the ecology of professionalism at all levels. While the estates and social classes of the Table of Ranks were not abolished, the social structure of the Russian Empire became more mobile, adapting to the demands of capitalism and accelerated economic development. Intellectuals formed their own special stratum of educated people known as the "Russian intelligentsia," who developed their own culture, ethos, and institutions, often in opposition to state forms (Shchetinina 1995). The bulk of the intelligentsia were professionals such as engineers, doctors, journalists, lawyers, teachers, and university professors (Pomeranz 1999). Local government bodies, the so-called *zemstva*, also needed qualified personnel such as bookkeepers, stenographers, architects, and postal workers (Balzer 1996). Thus, at the micro level a new ecological niche for the employment of professionals was established. The professional system of values emerging in these new teams was "based on qualifications and meritocracy" (Bailes 1996, p. 40), as opposed to selection principles based on hereditary estate or social class dominant in the civil service or the ideas of competition and profit prevailing among the Russian merchant class (Freeze 1992, p. 41).

Despite the existence of associations of businessmen and merchants, more prominent social involvement was observable in the new societies and associations formed on the national and local levels by representatives of intellectual professions. These organizations held conferences, conducted research, and published professional journals. The powerful influence of the Russian state meant that these professional communities did not become fully autonomous and self-regulating professions. However, the increasing disillusionment of these professional groups toward the state made an important contribution to the growth of critical attitudes to authority in intellectual circles.

A number of further developments in the political and social life of the country also affected the evolution of professional spheres. Dissatisfaction with the Tsarist regime only increased throughout the nineteenth century, leading Alexander III to suspend or even repeal many of his father's liberal reforms. Nonetheless, economic development continued unabated, and by the beginning of twentieth century, Russia had witnessed impressive progress in the modernization of her industry and transport system, even if her political system remained essentially unaltered, as an autocracy. In many cases, the emergence of many modern professions can be traced back to the prerevolutionary period. Although their development occurred under conditions of strict state control and the subordination of professions within the state administrative system, this was also an era marked by the emergence of self-organized professional communities who fought for the expansion of their political, civil, and social rights, while also attempting to spread enlightening messages to the larger population (Ryavec 2003). Therefore, at the onset of the era of the Russian revolutions, Russian society was diverse and complex, due in no small part to the coexistence of different types of professionalism within a variety of ecological niches.

Rapid industrialization and the growth of monopoly capitalism led to the accumulation of serious political, socioeconomic, and cultural contradictions, which resulted in spontaneous protests and the revolutionary events of 1905 and 1917. A particularly calamitous aspect of this was the powerless position of the working classes, which only grew more pronounced against a general backdrop of deteriorating health levels and falling living standards. A politically active minority of radical and liberal intellectuals helped

ignite a revolutionary spirit and new aspirations among the masses. The October Revolution of 1917 marked the beginning of a radical transformation to the structure of Russian society, bringing with it profound identity shifts and life style changes to many professional groups.

## The Reconceptualization of the Professions and Professionalization in the Soviet Era

Labor legislation was identified as a target of reforms in the immediate postrevolutionary period, with the aim being to eliminate capitalist elements in employment relationships and radically alter the structure of employment in the population. In official terms, the working class was declared the leading social group of the new socialist state.

The processes of economic and social modernization that occurred during state socialism brought with it the creation of new or modified administrative bodies in such areas as industrial management, the healthcare system, education, policing, law, and technological research and development. As part of the central economic planning system devised by the Soviet authorities, all manner of economic activity came under the control of a large party-state administrative apparatus (Mrowczynski 2012). These new conditions of state dominance led to the destruction of ecosystems for some professional groups and the creation of new ecological niches for others.

Professionalization in 1920s and 1930s was heavily linked to the division of labor and the development of specific vocations that were assigned roles in the project of "building socialism." This meant that people had to learn certain requirements in new skills and knowledge by gaining more and more qualifications, which would, in turn, allow individuals to progress up the career ladder. At the same time, labor specialization and the acquisition of specialist knowledge seemed to run counter to the prevailing ideals social justice and uniformity promoted by the socialist state. Professionalization in these terms was often perceived as a threat to equality; this was seen as a process that could potentially lead to a new alienation of the individual and his work from the masses, thus deepening class inequality (Iarskaia-Smirnova and Abramov 2016).

The years of the New Economic Policy (NEP) witnessed an economic recovery 1921–1928 that only highlighted the dearth of technical specialists in the USSR. This deficiency was partially remedied by inviting German and American engineers from abroad and utilizing the experience of home-grown prerevolutionary professionals, the so-called *spetsy* or specialists. These specialists were often treated with suspicion and were replaced at the first opportunity by the so-called *vydvizhentsy* (promoted workers). These were engineers who possessed more "appropriate" social origins who had received their training within the new Soviet system of education (Schattenberg 2011).

It was not uncommon from the end of 1920s for scientists and engineers to work in *sharashki*; secret laboratories located near prison sites. This practice continued throughout the period of Stalinist repression, which targeted the *spetsy*, many of whom were arrested and executed. Stalin's war on the "old cadres" can be seen as part of an ambitious plan to create a new Soviet elite (Fitzpatrick 1979), and contributed to the formation of a new view of professionalism, which was interpreted as skilled labor conducted for the benefit of the Soviet state.

By 1941, the process of replacing prerevolutionary professionals with new Soviet-educated specialists was largely complete. Soviet specialists became, in many ways, civil servants and fulfilled functions related to controlling the population, providing ideological support of the regime, and conducting the technical reequipping of Soviet industry and the army. The war with Nazi Germany (1941–1945), which demanded the total mobilization of human and technical resources for the needs of the front, led to a further reconceptualization of professionalism that affected the ecology of a number of professions. Under these conditions, for example, the profession of army medical services experienced a true blossoming. One victim of the Stalinist

repressions was the Soviet officer class, which was deprived of many thousands of trained military personnel, resulting in the loss of those capable of thinking independently. During the Second World War a new ethos emerged in the Soviet officer profession that was partially borrowed from the traditions of prerevolutionary Russian officers but also founded in the actual experience of battle and influenced by antifascist ideology. However, after the war, repression once again affected both Soviet officers and rank-and-file soldiers, which was linked to Stalin's fear of a growing spirit of independence in the Soviet army.

The Second World War era also witnessed a rise in the status of elite engineers, who designed the new weapons, whose skills were in serious demand by the military-industrial complex. During and after the war, providing the healthcare industry with a higher number of trained personnel became an important goal. While the total number of doctors doubled between 1940 and 1950, the Soviet medical profession significantly lagged behind Western country in terms of technical equipment (Krause 1991, p. 14), as did the wage level of doctors (Mankevich 2010).

Technological modernization also impacted upon the medical profession. During the Khrushchev "thaw" era, improving the quality of medical training and upgrading the equipment used in hospitals became a new priority for the Soviet state (Krause 1991, p. 14). These reforms were consistent with international trends of specialization in the medical profession which saw an increase in the status of medical specialists compared to that of general practitioners (Burton 2007). The criteria of professionalism for Soviet doctors in the 1950s and 1960s included strict submission to the rules of universal healthcare and displaying mastery of the full range of modern scientific and technical medical instruments.

The postwar period was also characterized by the expansion of access to technical and higher education, which was accompanied by the emergence of a new Soviet scientific and technical intelligentsia. The engineering profession evolved faster than others due to the key role it played in the Soviet technological development plans. The Soviet state prioritized heavy investment in education and job creation for engineers in the military-industrial complex and the aerospace industry, as well as in energy, communications, and other civilian sectors (Gerovitch 2015).

Various degrees of professional autonomy were enjoyed within the various subgroups of the Soviet scientific and technical intelligentsia, depending on the specific conditions in a particular industry (Josephson 1997). The scientific and technical intelligentsia worked in applied research institutes, the USSR's Academy of Sciences, universities, laboratories, and the engineering departments of industrial enterprises, as well as at those enterprises working in "closed cities," which handled production for sensitive strategic defense contracts (Brown 2013).

The postwar economic recovery permitted a significant improvement in the living standards in the 1960s within a context of continued urbanization and modernization (Harris 2013). The "thaw" era marked the end of mass repression as an instrument of state policy and heralded a weakening in levels of party supervision and a reduction in ideological pressure on the activities of representatives of the medical, legal, scientific, and engineering professions (Krause 1991, p. 9). This relative liberalization gave rise to the phenomenon of the *shestidesyatniki* ("the sixtiers"); a new generation dominated by representatives of intellectual professions, who were energized by the new possibilities of the "thaw" (Alekseeva and Goldberg 1990) and formed their own sociocultural niches enjoying relative freedom in terms of creative expression (Iarskaia-Smirnova and Abramov 2016). Inspired by these thaw-era policies of liberalization, as well as the successes of Soviet science in the 1960s, the Soviet scientific and technical intelligentsia formed a special work ethic based on selflessness, honesty, responsibility, and dedication to work (Abramov 2016). Representatives of this circle were also characterized by a strong contempt for bureaucratic hierarchy, possessing both a broad range of cultural and scientific knowledge and superior competencies within the narrower sphere of their own profession (Lipovetsky 2013).

## Professions and Professionalization in the Period of Late Socialism

In the Khrushchev era, Soviet ideology focused upon achieving social equality and uniformity across socialist society (Podmarkov 1973). The reality, however, was in contrast to the utopian values of social equality promoted by the state; in fact great variation in working conditions, wages, benefits, and prestige existed across different professions and industries. At one end of the scale were the most qualified "blue collar" professions, especially in the defense industry. At the other end were sectors such as agriculture, the food industry, and others, all of which suffered shortages in qualified personnel. Across the 1970s and 1980s, however, working-class professions also increasingly declined in prestige.

The Khrushchev "thaw" era (1955–1964) was one of rapid urbanization combined with an expanding Soviet-style consumer society. A variety of consumer services emerged with some rapidity in urban areas, with professions such as shop assistants, hairdressers, repairmen, and tailors becoming increasingly widespread. Their unimpressive social status and low official salaries were offset by lucrative kick-backs from private customers in what was known as "shadow economy." A further compensation was to be found in networks that shared of professional services that emerged at this time.

By the end of the Soviet era, the scientific and technical intelligentsia had become an important social and professional group but had lost much of their esprit de corps and relative autonomy they had enjoyed in the 1960s. The reasons for this were linked to increasing economic stagnation in high-tech industries, the reduction of opportunities for upward mobility, and a relative decline in wages. The political "freeze" that occurred in the Brezhnev era affected the mood of the scientific and technical intelligentsia; an increased apathy and indifference in attitudes to work was observable against a backdrop of decreasing opportunity for creative realization and career growth in the workplace (Iarskaia-Smirnova and Abramov 2016).

The late Soviet period was characterized by a contradictory combination of both tightening controls over professional groups and an increase in the importance of informal relations. The social networks that emerged in the workplace were supportive to their members and helped galvanize an identity based on one's labor and profession (Knudsen 2014). Professional life was organized through a number of different informal practices, negotiations, and interdependent relationships. Whole areas existed in which professionals were able to accumulate expertise and deposit cultural resources. Informal communication played an important role not only in the working relationship between employees and managers (Romanov 1995) but penetrated into all spheres of life in Soviet industrial enterprises, a process that, in many ways, breathed fresh air into their operations and allowed them to continue their work effectively in the stagnation era (Ashwin 1999, p. 143).

Despite the extensive possibilities on offer for those working in the Soviet professions to adapt to the existing system and even manipulate it to their advantage through a wide range of informal practices, by the end of the "perestroika" period (McForan 1988) the majority of professional groups had become critical of their working conditions. This sense of dissatisfaction was most graphically expressed in a variety of forms of political mobilization, such as miner strikes, rallies of the scientific-technical intelligentsia, and splits among the various unions of the creative intelligentsia (such as the Union of Soviet Writers).

While gender issues are not in the core focus of this entry, they are rather important for ecological understanding of professionalism as a social phenomenon. While women were awarded broad political and social rights in Soviet times, it is worth noting that these emancipatory measures tied in with state goals to mobilize human resources behind the construction of a new society (Ashwin 2000). The number of women working in the military dramatically increased during the war, whether in hospitals, communication units, or on combat missions, such as diversionary partisan units, or as snipers and pilots. On the home

front, women and teenagers replaced skilled workers in industrial enterprises, which was part of a more general trend whereby women dramatically increased their presence in the traditional spheres of "male employment" (Gruzdeva and Chertikhina 1983). The employment of women in professional jobs increased even more in the late Soviet period, although gender stereotypes continued to dominate and were an important factor in publicly legitimizing the unequal representation of men and women in many professions, influencing in turn the kind of education women would choose.

## Post-Soviet Professionalism: The Remapping of Occupations and Professions

The 1990s witnessed a radical transformation of living conditions in Russia, and the affects of this reached the labor market and the landscape of professional groups (Filtzer 1994). A rapid marginalization of status occurred among professional groups and the "intellectual occupations" such as doctors and school teachers. The latter were increasingly referred to as *byudzhetniki* (state employees) and portrayed as a burden for the state, which could no longer cope with the tasks of meeting its previous social obligations and sought ways of escaping from them. In the first half of the 1990s, chronic nonpayment of salaries became a problem across the country, especially in the sphere of educational and social services provision. Engineers and technicians also faced redundancies and joined the ranks of the "new poor" alongside teachers and doctors. Many of them came to make up a new post-Soviet "precariat," which was composed of various artisans and small producers, laborers, taxi drivers, *chelnoki* (shuttle traders), and the self-employed. A significant chunk avoided the precariat by retraining as commercial agents, real-estate agents, managers, business consultants, and the like. Much of this commercial work was set up on an informal and temporary basis.

The situation improved slightly in the first decade of the twenty-first century, which saw impressive levels of economic growth. However, the rewards of this growth were not evenly spread, with professionals employed in public research institutions, the healthcare system and education at a disadvantage in comparison to those working in the private sector. The reforms aimed at improving efficiency and reducing costs have led to a revision of the contractual relations between the professional communities and the state; instead of long-term relationships involving state support for professional activities, the new preference is to only grant commercial contracts of limited duration, which effected an increase of instability in the employment of professionals.

The collapse of the socialist economy and the gradual destruction of the Soviet model of professionalization has opened up new opportunities for those types of employment that were able to respond to market realities and adapt to new conditions emerging from the radical transformation of post-Soviet society. Under these conditions, a variety of strategies have proven effective in terms of achieving professionalization. Over the course of the market reforms new professions in the field of business formed, and a new social group of small entrepreneurs emerged. Many new professional groups set out to acquire the institutional attributes of professionalization. This could involve, for example, the licensing of special educational programs and the creation of associations. At the same time, some professional groups failed to acquire professional status in the classic sense of the Anglo-Saxon sociology of professions. In some cases, this was due to the fact that some professional groups were not able to survive for very long when faced with conditions of economic and social instability.

In addition, certain intellectual professions, which in Soviet times were either banned or forced to cater exclusively for the ideological needs of the party and the government, have now been either reformed or undergone a profound transformation, discovering a wide range of development opportunities. This was the case with the legal profession, whose role and specialization has increased dramatically. New legal associations for lawyers and judges appeared, with some of these associations even receiving significant public recognition for their clear stances on public issues (Mrowczynski 2012).

Journalism has also been significantly transformed away from its previously subservient role under the ideological and organizational supervision of the Union of Journalists during the Soviet period. Political and civil liberalization has led to the emergence of professional organizations engaged in human rights work or offering services as political consultants.

In the post-Soviet period, the gender organization of professional world has also changed. In the sphere of private business new opportunities for a professional career have opened up, and an image of "business lady" became fashionable since 1990s, but the owners of the managers of private companies were still mainly men (Chirikova 1998), while women held positions of accountants, secretaries, and sometimes specialists in PR and advertising. Thus, the Russian business has been reproducing the patriarchal gender order. Today Russia tops the list of countries with the highest number of female board members, here 45 percent of senior management positions are held by women, according to the report (Grant Thornton 2016). However, women prevail in the owners and managers of small and middle rank businesses, while in the upper echelon of managers and among the big business owners their share remains low.

The occupations of the welfare state (including, for example, doctors, teachers, and social workers) in post-Soviet Russia are still mostly women, and only with the beginning of the reforms in the field of school education since 2010–2012 men were more likely to appear in leadership positions (as school principals). In the legal profession there is an interesting trend: the notaries and judges today mostly are women. According to the research, women make up to the two third of the judiciary (Volkov et al. 2015, pp. 87–91). Moreover, among the lawyers related to finance the share of women is lower. Surprisingly, women predominate also among the detectives (investigators) (Titaev and Shklyaruk 2016, pp. 40–43), although this profession considered to be "male" in Soviet times. In general, we can say that in the post-Soviet era there are no special mechanisms regulating gender aspects of professionalism. The significant gender disparities are reproduced and occurring anew in various professional fields.

Economic growth and a new "consumer revolution" has greatly changed the social and economic landscape of Russia since the early 2000s. In addition, the Internet has acquired a significant role as a sector of the economy, both as a means of communication and entertainment. This has had serious implications not only for the formation of new occupations and types of employment but also in the sense that it has opened up new possibilities for professional activity, primarily in the form of freelancing, remote working, and coworking. Improvements in the quality of life in one's later years have helped stimulate demand for new professions and specializations focused on the servicing of the new consumer habits. Experts in the field of relaxation, beauty and image, various consultants, fitness coaches, and representatives of many other new professions are often employed in this informal sector with rather unstable employment prospects. However, given the prevalence of these types of employment, it would appear that we are looking at a new model of professionalism. Over the past 15 years, this tendency for new professional groups to form can also be seen in "white-collar" and "corporate employment." This includes representatives of various classes of skilled workers and administrative-bureaucratic staff employed at large and medium-sized businesses such as auditors, middle managers, employees of commercial departments, corporate lawyers, financial analysts and accountants, PR-specialists, and those working in marketing and advertising.

Government reforms in a variety of sectors have led to the emergence of new channels of professionalization and the development of new types of employment. These reforms have also impacted on existing, established professions. For example, the armed forces have introduced the practice of employing privates and sergeants on the basis of private contracts. The emergence of the "contracted worker" in the state tax inspection bodies has considerably altered the functions and nature of the organization of the tax authorities. Similar changes can be observed in the creation of a new state rescue services body with its

own identity and set of functions under the purview of the Ministry of Emergency Situations. Social work reemerged as a fully fledged profession in 1991, when professional training in this area was officially launched (Iarskaia-Smirnova and Romanov 2002).

In the current period the government is actively pursuing neoliberal reforms in the sphere of education, science, social services, and health care. At the core of this ideology of social reform and the creation of professionalism is the utilization of a managerial approach and improving "efficiency." This is in line with global trends, where the "old professionalism" is either retreat or is undergoing significant change under the pressure of neoliberal reforms affecting the welfare state model. In Russia, this is also quite painful and changes the existing model of professionalism, reducing the degree of professional autonomy and making professionals even more dependent on the control and custody of the state and quasi-corporate management styles at universities or large clinics.

## Conclusions

While the dominant trend in Western countries has been for professional groups to campaign for the enhancement of the role of the state and demonstrate the power to resist neoliberal policies of total noninterference in the free market (Abbott 1988), the Russian context is rather different. Russian society has suffered from a shortage of entrepreneurial values and a lack of freedom in terms of professional activity. Being dependent on the state, professions have sought to achieve a certain degree of autonomy and improve their prospects for self-regulation. Compared to Western Europe, where professionalism is founded on specific middle-class values such as independence and responsibility for one's work, in the Russian prerevolutionary period the main way professionalism was understood as part on a work ethic that was dedicated to the idea of state service.

The Soviet state created a new map of occupations, destroying or reforming old professional groups. Official propaganda glorified feats of heroic labor and lauded the professionalism of workers, doctors, and teachers, while also at the same time suppressing or inhibiting the formation of independent professional groups. At the heart of the rules of professional conduct and the borders of collective identity that solidified in the Soviet era, however, were key internal values, norms, and concepts that emerged informally as part of the daily working practices and relationships of employees and customers. At the same time, throughout the Soviet period the collective identity of various professions was formed in close conjunction with the state apparatus. This relationship, which can be traced back to the era of the late Russian empire, is marked by the state determining the status and identity of different professional groups, and was preserved through the socialist period, even remaining a force in post-Soviet Russia (Becker 2011). With the end of the 1990s and the dawn of the twenty-first century, the map of the professions in Russia was again actively redrawn. New forms of professionalization appeared "from below" through business activity and trade unions, while it has also been driven "from above" by means of state regulation. Today, the boundaries between different professions and types of employment have become more mobile, and professionalization strategies more flexible. At the same time, we can see that the resources employed in building a professional identity have also become more diverse.

# Professionalism and the Ethics in Selected Local Governments in the Philippines

Yolanda I. Camaya and Arneil G. Gabriel
Department of Public Administration, Nueva Ecija University of Science and Technology, Cabanatuan City, Philippines

## Synonyms

Actual adherence; Behavior in public service; Ethical conduct; Good behavior in profession; Norms of conduct; Standard of behavior

## Definition

Professionalism is the application of moral and ethical standards into the practice of the profession in the office, school, organization, and all entities, public or private. It is also a state of being aware of norms of conduct and behavior and observing actual adherence thereto while executing the duties and functions of a public office.

Ethics is a set of rules, regulations, or expectations accepted as the standard or at the very least acknowledged in a given field (Henson 2016). It is a set of norms and conducts that govern the execution of functions in the public office.

## Introduction

Professionalism in public office goes beyond acquisition of a college degree. Becoming professional needs the application of moral and ethical standards into the practice of the profession in the office, school, organization, and all entities, public or private. As Pereira (1997) contended:

Being professional means more than just employing professionals or paying lip service to professional values. It requires a thorough

understanding of professionalism and strict adherence to public norms of model behaviour.

Professionalism is considered as a superior form of governance when done in accord with technical know-how and in conformity to standard of behavior of doing things as determined by one's profession. This concept of professionalism sometimes invites ethical source of tension when working with the bureaucracy where cost-efficiency associated with the concept of "managerialism" is the bench mark of performance. Professionalism, in contrast to managerialism, is a prescribed code of conduct and standards of doing things to generate positive outcomes to the public clients (Salvatore and Numerato 2017). Its virtues are the bases of actions and not solely efficiency and effectiveness in the distribution of public resources as suggested by managerialism of the NPM Era. Professionalism has also the potential to improve bureaucracy and the delivery of services to the public, because it discourages exercise of discretion of street-level agents and execute functions of office based on set of standard of behaviors instead (Freyss 2017). Professionalism is a component of bureaucratic competence when public administrator strikes the delicate balance between professionalism and delivery of public needs separate from personal relations, e.g., loyalty to political powers (Atkinson 2017).

Meanwhile, the need for ethics in public service is universally recognized. Ethics is a set of norms and work standards that govern the conduct of government personnel contextualized in the different political territories all around the world. For instance, in the United States, the American Society of Public Administration drafted and implemented the Professional Standards and Ethics in 1994; in Canada, the Values and Ethics Code was written in 2012; in the United Kingdom, the Civil Service Code was promulgated in 1996. In the Philippines, the Code of Conduct and Ethical Standards is explicitly provided for in the 1987 Philippine Constitution. And as offshoot of the constitutional mandate, several ethical codes were formed, the Philippine Civil Service Law; the Code of Conduct and Ethical Standards for Public Officials and Employees, also known as RA 6713; and the Anti-Red Tape Law or RA 9485, in addition to institutional policies, rules, and regulations promulgated and implemented in each government office, bureau, or corporation (De Leon and De Leon Jr 2014). According to Rose (2017), ethics as a practice, is necessary for achieving a well-functioning public administration. For Robertson 2017 it is a set of moral principles that govern the public sector. The role of ethics in the organization is to enhance ethical governance (Saban 2016). But despite the crafting of too many laws on ethics and values in public service, a few studies on ethical standards and shared values linked to transparency and accountability in the Philippines show that among government personnel, more actions are being essential to ensure its reflection in high level of actual adherence(Gabriel 2017; and Gabriel and Gutierrez 2017).

In the Philippines, the exact opposite of professionalism is mistakenly perceived in the operation of the bureaucracy, thereby creating distrust of the public to the public institution (Brillantes and Fernandez 2011). The perceived unethical bureaucracy, being the nexus of democracy and the people and as legally prescribed by principal agent theory, paints an ugly picture of the system (Ita and Titus 2018). Consequently, the public is conditioned to settle for substandard government services committed by unethical leaders and government personnel (Alfiler and Nicolas 2007), alongside to this is the inconsistent implementation of the laws on ethics. Ethics as a concept is considered by Greek philosophers as a "transcendental" set of norms of behavior drawing a fine line between what is right and what is wrong (Argyriades 2016); it is an imperative in the public service (United Nations New York 2000) and, as viewed by Alibašić (2018), is an important component of development sustainability in local government planning.

This contribution is part of a larger study focusing on the measurement of the professional practices and actual adherence of government personnel on the Code of Conduct and Ethical Standards for Public Officials and Employees (RA 6713) in selected cities and municipalities of Nueva Ecija in the Philippines during the fiscal year 2017. The chapter measured the adherence to

the norms of conduct and ethical standards in the public service of department heads, personnel, and constituents. It used the assessment parameters of (a) commitment to public service, (b) justness and sincerity, (c) political neutrality, (d) responsiveness to the public, (f) nationalism and patriotism, (f) commitment to democracy, and (g) simple living. The chapter compares the appraisal made by department heads, personnel, and constituents across selected cities and municipalities of Nueva Ecija in the Philippines; it determines and compares the actual practices incongruent to the norms of conduct. The participants to the study were 96 department heads, 288 personnel from 10 municipalities and 2 cities, and 140 constituents selected using convenience sampling method. The chapter triangulated the appraisal made by department heads and personnel by the appraisal of constituents who are the benefactors of public service delivery. The chapter used the descriptive method of research. It is a research design where events are recorded, described, interpreted, analyzed, and compared. The data was gathered by the application of Likert Scaling tool with five-point options to measure the perception of the different groups of participants. The scaling options are strongly agree, agree, moderately agree, disagree responses, and strongly disagree.

## Adherence to the Norms of Conduct and Ethical Standard

The merging of knowledge on the norms of conduct by public servants and actual adherence are considered by this chapter as factors of professionalism. Data were gathered through the use of questionnaire and interviews. A total of 524 participated in the study, and they come from the 8 mandatory offices of the local government units (LGU): accounting, assessor, budget, engineering, health, planning and development, civil registry, and treasury of the selected city and municipal government offices of Nueva Ecija. To validate their responses, perception of the constituents was also solicited. Table 1 shows the summary of appraisal per group of participants including the overall appraisal.

The comparability of appraisal of department heads of municipalities and cities is obvious as they responded *strongly agree* to all factors of professionalism in public service. This means that they are convinced that majority of the components of professionalism are observed in their offices. However, when compared to the responses of personnel and constituents of the ten municipalities and two cities, there is a difference in the average appraisal. The personnel and constituents *agree* that components of

**Professionalism and the Ethics in Selected Local Governments in the Philippines, Table 1** Appraisal on the adherence to the norms of conduct and ethical standards in the public service by department heads, personnel, and LGU constituents across cities and municipalities in the Province of Nueva Ecija

| Norms of conduct | Appraisal on the adherence to the norms of conduct and ethical standards in the public service | | | |
|---|---|---|---|---|
| | Department heads of cities and municipalities | Personnel of cities and municipalities | Constituents | Overall appraisal |
| (a) Commitment to public service | Strongly agree | Agree | Agree | Agree |
| (b) Justness and sincerity | Strongly agree | Agree | Moderately agree | Agree |
| (c) Political neutrality | Strongly agree | Agree | Agree | Agree |
| (d) Responsiveness to the public | Strongly agree | Agree | Agree | Agree |
| (e) Nationalism and patriotism | Strongly agree | Agree | Agree | Agree |
| (f) Commitment to democracy | Strongly agree | Agree | Moderately agree | Agree |
| (g) Simple living | Strongly agree | Agree | Agree | Agree |

professionalism are observed in their respective local government units different from department heads with *strongly agreed* response. Part of the duties of department heads is to serve as example to the personnel. It is their managerial responsibility to their subordinate. Hence, their appraisal of themselves must come closer to the ideal regardless if their personnel and constituents perceived otherwise. The appraisal of constituents on the different departments of the LGUs revealed the differing responses compared to the responses of the department heads in all factors affecting professionalism such as commitment to public service, justness and sincerity, professionalism, responsiveness to the public, nationalism and patriotism, and commitment to democracy. Meanwhile, a comparison in the appraisal of the three sets of respondents across cities shows that majority of the participants have comparable responses, although of different levels of agreement. Across groups, however, significant difference in appraisal is apparent on "justness and sincerity" and "commitment to democracy." The three groups of respondents have varying appraisal of the factors of professionalism.

## Professionalism Goes Beyond Awareness

Knowledge on the concept of professionalism is not enough to improve public service. It must be coupled with actual adherence translated into actual practice.
